Four stands of twelve varieties competed, and very fine they were. Mr. J. Lakin was placed 1st, with—Heavy red edge: Brunette, Mrs. Dodwell, and Mrs. Summers. Heavy purple: Purple Prince and Mrs. Niven. Light purple: Jessie and Nymph. Heavy rose: Constance Heron, Royal Visit, Mrs. Payne, and Edith d'Ombraint. Light rose: Favourite, 2d, Mr. Robert Lord, with—Heavy red: Emily, Master Norman, and Winted Esther. Heavy purple: Zerlina. Light purple: Clara Penson. Heavy rose: Lady Homesdale, Constance Heron, Royal Visit, and Mrs. Radd. Light rose: Nellie, Miss Wood, and Favourite. 3d, Mr. Rowan; 4th, Mr. George Chaundry.

In the class for six blooms fifteen collections competed, Mr. John Payne, Worcester College, St. Paul's, Oxford, being 1st, with—Heavy red: Muriel and John Smith. Heavy purple: Zerlina. Light purple: Thomas Witham. Heavy rose: Royal Visit and Mrs. Payne. 2d, Mr. Henwood, with—Heavy red: Brunette. Light red: Clara. Heavy purple: Purple Prince. Light purple: Jessie. Heavy Rose: Royal Visit and Mrs. Rudd. 3d, Mr. C. Phillips; 4th, Mr. J. S. Hedderley; 5th, no name; 6th Mr. Thomas Austiss; 7th, Mr. T. Bower; 8th, no name.

In the classes for single blooms of Picotees the awards were as follows:—Heavy red: 1st and 2d, Mr. T. Austiss, with Mrs. D. Austiss; 3d, Mr. C. Phillips, with John Smith; 4th, Mr. Henwood, with Mrs. Dodwell; 5th, Mr. Phillips, with Brunette. Light red: 1st, 3d, and 5th, Mr. Phillips, with Thomas William; 2d, Mr. Lakin, with Mrs. Girtton; 4th, Mr. H. Startup, with Thomas William. Heavy purple: 1st and 5th, Mr. Walker, with Purple Prince; 2d, Mr. Rowan, with Alliance; 3d, Mr. Startup,

with Purple Prince; 4th, Mr. Phillips, with Zerlina. Light purple; Mr. Hedderley was 1st and 2d, with Clara Penson; and Mr. T. Austiss 3d and 4th with the same; Mr. Walker being 5th with Mary. Heavy rose: Mr. Rowan was 1st, 2d, and 3d, with Mrs. Payne; Mr. Henwood 4th, with Edith d'Ombraint; and Mr. J. Lakin 5th, with Elise. Light rose; Mr. Rowan was 1st, 2d, 3d, and 4th, with beautiful blooms of Rudd's Nellie; Mr. T. Austiss being 5th, with Favourite.

YELLOW GROUND PICOTEES.

Mr. Hedderley was 1st, with Edith; Mr. Lakin 2d, with Midas; Mr. Phillips 3d, and Mr. Henwood 4th, with Florence; Pride of Penhurst without an exhibitor's name being 5th.

The premier Picotee was a truly wonderful bloom of Luddington's Favourite, shown by Mr. J. Lakin. A First-class Certificate of Merit was awarded to Mr. T. Austiss, Bill, for heavy red edge Picotee Mary D. Austiss, with the way of Fellow's Morna, pure in the ground, smooth in the petal, and with a well defined edge of red.

COLONIAL NOTES.

MORTALITY IN PLANTS, &c., RECEIVED AT NATAL.—In the report for 1885 of the Natal Botanic Society, Mr. Wood, speaking of plants received, says:—"It should be remarked that of the large number of plants which were dead on arrival, or died afterwards, no less than sixty, or half the number, were different varieties of Clematis, of which plant we received a large shipment, a few only of which are alive at the present time, and even these are not doing well.

"Of the seeds which failed, forty-two packets were received from one correspondent, only one of which germinated, and from another correspondent no seed we have yet received has shown any sign of growth.

"This is very disheartening, and more care should, I think, be exercised in sending out seeds, as it is worse than useless to send those which can be of no use whatever to the recipient. From other correspondents most of the seeds we have received have germinated well, though from different causes we do not always succeed in rearing the plants."

METEOROLOGICAL OBSERVATIONS FOR NATAL.

The following information, useful to growers of Natal plants, is taken from the abstract of the meteorological observations for the year 1885, taken at the Natal Observatory, and published in the report of the Natal Botanic Society for 1885. Readings at 9 A.M. :—

	Jan.	Feb.	Mar.	April.	May.	June.
Thermometer in shade	*	*	*	*	*	*
Highest	95.7	98.3	94.8	87.4	88.5	92.8

Rainfall (inches)	0.03	0.61	10.43	2.75	3.15	4.93

NATIVE TREES OF THE CAPE.

Mr. Wood, the Curator of the Natal Botanic Society, states in his annual report :—

"When Sir H. E. Bulwer visited the gardens prior to his departure from the colony, he suggested that it would be advisable to set apart a portion of the ground solely for native trees. I pointed out to His Excellency that we have already in cultivation many of our indigenous trees, and that we are constantly adding to the number. Whether it is practicable to reserve part of the small area still available for this purpose is a matter that will, I think, require further consideration, though I shall lose no opportunity of procuring seeds or plants of our indigenous trees or shrubs to add to our collection.

"Amongst others, the coast 'Yellow Wood,' Podocarpus elongata, l'Her., is, I think, worthy of preservation, as, in the vicinity of Durban at least, it is in

danger of being exterminated. I have noticed that persons will purchase readily plants of the up-country Yellow Wood tree, P. latifolius, which are hardly likely to do well on the coast, while they neglect altogether this species, which will thrive here. Perhaps the reason may be found in the fact that what may be had for the taking away is little esteemed, while plants which cost money are, of course, considered to be valuable."

CEDRELA ODORATA IN SOUTH AFRICA ("WEST INDIAN CEDAR").

We have propagated during the year as many of these plants as we could from seed gathered in the gardens. A small bag of seed was also received from the Director of Kew Gardens, but unfortunately the greater part of it did not germinate, though every care was taken of it. Plants have been sent to the railway department for planting along the lines and at the stations, also to the Maritzburg Botanic Gardens for trial in that locality, and have been sold to different applicants. This tree appears to be well suited to the coast districts, and grows rapidly. One which was planted in the gardens in November, 1884, is now 5 feet high, and I have heard of some plants in more favourable localities which have attained nearly double this height in about the same time; and it has the great advantage that the white ants which destroy so many young trees upon the coast, especially the Eucalypti, do not appear to molest this one. J. M. Wood, in Report of Natal Botanic Society.

PINUS SINENSIS IN SOUTH AFRICA.

This is a tree which I think will be likely to succeed in the colony, and as yet it does not appear to be known here. I received a small packet of the seed from Hong Kong some time ago, and plants raised from it appear so far to be doing well. I applied to Mr. Ford, of the Botanic Gardens, Hong Kong, for a larger supply, and he very kindly sent me quite sufficient to let the plant have a fair trial. I have distributed this seed to farmers and others in different parts of the colony, both in the coast and inland districts, and hope to receive favourable reports of its growth and progress. J. M. Wood, in Report of Natal Botanic Society.

SEEDLING ARAUCARIAS IN THE CAPE.

The Curator of the Natal Botanic Society, in his annual report for 1885 states:—"Two species of Araucarias in the gardens have borne fruit for several years, but the seeds have always been infertile. During last season one of the trees of A. Cunninghami bore seeds which germinated, and the gardener has succeeded in rearing a few plants from them; these are, so far as I am aware, the first Araucarias reared from seed in the Colony. The age of the tree which produced the seed I am unfortunately unable to ascertain with certainty, but I believe it to be about twenty-five years."

The Weather.

STATE OF THE WEATHER AT BLACKHEATH, LONDON, FOR THE WEEK ENDING WEDNESDAY, AUGUST 4, 1886.

- July 29.—Fine, but frequently cloudy and dull.
- 30.—Mostly cloudy and dull, but fine occasionally.
- 31.—Rain early in the morning, afterwards fine and bright; dull night.
- Aug. 1.—Fine morning, rain after 5 P.M.
- 2.—Dull morning, with rain; fine afternoon.
- 3.—Fine day, frequently bright and cheerful.
- 4.—Moderately fine morning, chiefly dull, but fine day and night.

LONDON: Atmospheric Pressure.—During the week ending July 31, the reading of the barometer at the level of the sea decreased from 29.69 inches at the beginning of the week, to 29.48 inches by 9 A.M. on the 26th, increased to 30.12 inches by 1 P.M. on the 28th, decreased to 29.68 inches by 5 P.M. on the 30th, and was 29.78 inches at the end of the week.

The mean reading of the barometer for the week at the level of the sea was 29.78 inches, being 0.04 inch lower than last week, and 0.15 inch lower than the average of the week.

Temperature.—The highest temperature in the shade in the week was 74° on the 31st; on the 27th the highest was 60° 4'. The mean of the seven high day temperatures was 67° 6'.

The lowest temperature in the week was 45° 7' on the 28th; on the 31st the lowest was 55° 6'. The mean of the seven low night temperatures was 52° 5'.

The greatest range of temperature in one day was 19° on the 30th; the smallest was 6° 6 on the 27th. The mean of the seven daily ranges was 15° 1'.

The mean daily temperatures were, 60° 2 on the 25th; 60° 7 on the 26th; 55° 5 on the 27th; 54° on the 28th; 60° 3 on the 29th; 63° 8 on the 30th; and 60° 4 on the 31st, and these were within their averages, with the exception of the 30th, which was 1° 5 above, by 2°, 1° 5, 6° 7, 8° 2, 2° and 1° 9 respectively.

The mean temperature of the week was 59° 3, being 5° 4 lower than that of last week, and 3° below the average of the week.

The highest reading of a thermometer with blackened bulb in vacuo placed in the full rays of the sun, was 126° on the 30th. The mean of the seven readings was 116°.

Rain.—Rain fell on three days to the amount of 0.85 inch.

ENGLAND: Temperature.—During the week ending July 24, the highest temperatures were 76° at Cambridge, 74° at Blackheath, 72° at Brighton; the highest at Hull and Preston was 66°, at Bradford, 64° 6, and at Newcastle 62°. The general mean was 68° 2'.

The lowest temperatures were 38° 9 at Wolverhampton, 42° at Hull, 45° 7 at Blackheath; the lowest at Preston was 50°, at Leeds was 49°, and at Brighton was 48° 8. The general mean was 46° 2'.

The greatest ranges were at Wolverhampton, 32° 6, at Cambridge 30°, and at Blackheath, 28° 3; the least ranges were 16° at Preston and Newcastle, 16° 8 at Bradford. The general mean was 22° 2'.

The mean of the seven high day temperatures was highest at Cambridge 70° 8, at Brighton, 69° 1, and at Blackheath, 67° 6; was lowest at Newcastle, 59° 1, at Bradford, 60° 2, and at Liverpool, 61°. The general mean was 64° 3.

The mean of the seven low night temperatures was highest at Brighton, 54° 3, at Truro 53° 9, and at Plymouth 53° 2; and was lowest at Wolverhampton, 48° 1, at Hull 49° 3, and at Newcastle 50° 1. The general mean was 51° 6.

The mean daily range was greatest at Wolverhampton, 15° 3, at Blackheath 15° 1, and at Brighton 14° 8; and was least at Newcastle and Bradford, 9° 1, and Liverpool 9° 5. The general mean was 12° 7.

The mean temperature was highest at Brighton, 59° 9, at Cambridge 59° 3, and at Truro 58° 2; and was lowest at Newcastle, 59° 9, at Sheffield, 53° 5, and at Bradford 53° 9. The general mean was 56° 5.

Rain.—The largest fall was 4.26 inches at Leeds, 3.36 inches at Bradford, and 2.25 inches at Preston; the smallest fall was 0.56 inch at Truro, 0.60 inch at Brighton, and 0.85 inch at Blackheath. The general mean fall was 1.64 inch.

SCOTLAND: Temperature.—During the week ending July 31, the highest temperature was 73° 3, at Paisley; at Aberdeen the highest was 61°. The general mean was 66°.

The lowest temperature in the week was 39° 5, at Glasgow; at Aberdeen the lowest temperature was 45°. The general mean was 42° 7.

The mean temperature was highest at Paisley, 56° 1; and lowest at Aberdeen, 52° 1. The general mean was 54° 3.

Rain.—The largest fall was 0.64 inch at Aberdeen, and the smallest fall was 0.20 inch at Dundee. The general mean fall was 0.41 inch.

JAMES GLAISHER, F.R.S.

SUMMARY OF TEMPERATURE, RAINFALL, AND DURATION OF BRIGHT SUNSHINE in the United Kingdom, for agricultural and sanitary purposes, for the week ending Monday, August 2, 1886, issued by the Meteorological Office, 116, Victoria Street, London, S.W.:—The weather has continued in a very unsettled condition generally, with cloudy or overcast skies and occasional falls of rain.

The temperature has been below the mean in all districts, the deficit ranging from 2° in the "Channel Islands," and three in the south and south-west of England to as much as 5 in all other parts of England, the north of Ireland, and the east of Scotland, and to 6° in "Scotland, N." The highest of the maxima, which were registered on different days in the various districts, ranged from 74° in "England, S." to 63° in "Scotland, W.," and to 57° in "Scotland, N." On July 27 the daily maxima at nearly all of our stations were below 60°. The lowest of the minima, which were generally recorded either on July 28 or 29 ranged from 30° in "Scotland, N." (at Wick), to 38° in the "Midland Counties," and 39° in "England, S.W." and to 51° in the "Channel Islands."

Rainfall has been more than the mean in "Scotland, N.," and "Ireland, S.," and equal to it in "England, N.W.," but rather less in all other districts.

Bright sunshine has not differed materially from that recorded last week, the percentages of the possible amount of duration ranging from 19 in "Scotland, N.," to 39 in "England, N.W.," and 42 in the "Channel Islands."

Depressions observed.—Barometric pressure over our islands and their neighbourhood has continued in an unstable condition, the mercury being highest over Spain and the South of France, while several small shallow depressions have travelled from the westward over the United Kingdom and the North Sea. Moderate to fresh breezes, from the southward, as the disturbances advanced, and from the westward or northward as they passed away, have consequently been prevalent on most parts of our coasts; in the extreme north, however, moderate easterly airs were experienced on July 30.

Obituary.

MR. THOMAS BUSH.—Many of our readers will learn with regret of the death of Mr. Thomas Bush, of the Cotham Nurseries, near Bristol, formerly a partner of the late Mr. Thomas Parker, of St. Michael's Hill. The death was the result of an accident which occurred recently. Mr. Bush was driving with a friend to his nursery at Brenty, when his horse stumbled on a stone near the bill at Westbury and fell, so suddenly and with such force that Mr. Bush, who was driving, was thrown over the animal's head. He was forty-five years of age, and of a most unassuming manner, yet frank and genial—these qualities being allied to a generous disposition and ever-pleasing address, which won him a very large circle of friends who will lament his loss. He was well known as one of the most skilled florists in the western counties, and had a thoroughly practical knowledge of the various branches of the florist's art.

Enquiries.

"He that quatemeth much shall learn much."—EACON.
NOTICE TO LEAVE.—Will some reader kindly say what notice of dismissal a gardener could legally claim who has received his salary half-yearly only, and where no arrangements of any kind were made when engaged, only that wages should be paid half-yearly? Also, has it been decided in any court of law that a gardener is a domestic servant? H. P.

Answers to Correspondents.

GRAPES: Di's. The berries are affected with rust caused by the sun shining on them when wet. Cold draughts of air will also cause the appearance at certain stages.

LUZULA ALBIDA: P. T. 7. We do not suppose this plant to be indigenous in your district, but it may have been brought from foreign sources.

NAMES OF PLANTS: A. B. Chrysanthemum segetum.—

G. A. 1, Achillea Millefolium; 2, Butomus umbellatus; 3, Malva moschata; 4, Erythraea Centaurium; 5, Solidago virga aurea; 6, Verbascum Plataria.—A. 7. H. Lotus corniculatus, double-flowered variety.—7. R. 1, Adonis vernalis; 2, Graphophlum arvense; 3, Hieracium aurantiacum, alias "Jim the Collier."—J. H. Apparently the American water weed, Anacharis alismatum, but the specimen was withered.—F. H. B. Eupatorium glechomifolium.—H. H. Nerium Oleander. We do not give florists' names. For the names of the Pelargoniums you should apply to some nurseryman who grows them largely.—P. T. L. 1, Bromus asper; 2, Juniperus communis, the common Juniper; 5, Maticaria inodora.—J. S. An Eryngium. Probably E. amethystinum.—5. E. D. Lilium testaceum.—H. D. 1, Lilium Hansoni; 2, L. canadense. Both specimens were withered beyond certain recognition.—H. A. Dendrobium longicornu.—G. A. Trachelium coturnicum.

RATING: 7. Scarle. You will find as much information as is necessary in our columns for 1877, vol. viii., p. 164; 1883, vol. xv., p. 45; 1885, vol. xviii., p. 678; 1885, vol. xxiv., pp. 155, 183, 498, 720, 758, 816, particularly in the two first references.

ROSES: H. B. All the blooms should be fully grown.

WEED-HEAP: C. D. If you could mix a quantity of stable litter with the weeds, so as to set up a heat, say about 100° Fahr., the weed seeds and roots would be killed, and the material would be rendered better fitted for plant food, and could be used after having been turned, and allowed to ferment a second time, for a week or thereabouts. You could keep in much of the ammonia given off by the fermentation by covering with 3 or 4 inches of soil well patted down with the spade, or you might use washashes or a side salt with the weeds, and water the heap with the contents of the manure-tank before wheeling on the quarters.

WARNER'S WINDMILLS FOR PUMPING, DRAINAGE, or IRRIGATION. Nothing better in favourable positions.

WARNER'S STAR WINDMILLS. Gold and Silver Medals awarded, Calcutta Exhibition, 1884.

Gentlemen—I am glad to be able to inform you that the Wind Engine you fitted for me about a year ago gives great satisfaction, as it is very seldom that there is not enough wind to work it, as it works with a very light breeze, except in one direction, where trees shelter it too much.—Yours truly, Messrs. J. Warner & Sons.

Island of Coll, Argyllshire, N.B., October 15, 1883. Dear Sir,—I enclose a cheque in payment of account for the Windmill, which is working admirably. So far it is a decided success, and the previous hand-cumper is saved much labourous work.—Yours truly, JOHN JAMES STEWART.

Messrs. John Warner & Sons. Prices and Catalogue upon application, with data of requirements. JOHN WARNER AND SONS, Crescent Foundry, Cripplegate, London, E.C.; and the Foundry Works, Wallon-on-the-Naze, Essex.

To be obtained of every Ironmonger and Plumber in the Kingdom. VAN BOX, covered, suitable for Market Work; well made and nearly new. Price £15. COWLES, Woodford Green, Essex.

NEW SEASON'S ARCHANGEL MATS.—My first parcel has now arrived in good condition and prime quality. Prices on application. JAMES T. ANDERSON, 149, Commercial Street, London, E. REGISTERED TELEGRAPHIC ADDRESS—JATEA, LONDON.

First Arrival New Archangel Mats this Season. BLACKBURN AND SONS are now prepared to quote Prices to Buyers on application at 4 and 5, Warmwood Street, London, E.C.

To Nurserymen, Seed Merchants, and Florists. BLACKBURN AND SONS are offering Archangel MATS lower than any other house in the Trade. Also Petersburg MATS and MAT BAGS, RAFFIA FIBRE, TOROICO PAPER, and all other articles. Prices free on application.—4 and 5, Warmwood Street, London, E.C.

Oil Paint no Longer Necessary. HILL AND SMITH'S BLACK VARNISH, for Preserving Ironwork, Wood, or Stone.

This VARNISH is an excellent substitute for oil paint or any outdoor work, and is fully two-thirds cheaper. It was introduced upwards of forty years ago by the Advertisers, and its genuine good quality, notwithstanding a host of unprincipled imitations, is fully attested by its constantly increasing sale. It may be applied by an ordinary labourer, requiring no mixing or thinning, and is used cold. It is used in the grounds at Windsor Castle, Kew Gardens, and at the seats of most of the Nobility and Gentry, from whom the most flattering testimonials have been received.

Sold in Casks of about 30 gallons each, at 12. 6d. per gallon, at the Manufactory, or 12. 8d. per gallon carriage paid to any Station in the Kingdom.

UNSOLICITED TESTIMONIAL. From ALBERTO LEVIE, Esq., The Rivers, Albury Lodge. "Some twenty years ago I used your Black Varnish, and shall be glad if you will forward me a cask, as I consider it the best thing known for the preservation of all outdoor work, either wood or iron, that requires to be painted."

CAUTION.—HILL & SMITH would particularly warn their Customers against the various cheap Varnishes now so much advertised. Every cask is legibly marked with their name and Registered Trade Mark as above, without which none is genuine. Large Illustrated Catalogue, containing Hardies, Field and Entrance Gates, &c., sent free on application to HILL & SMITH, Brierly Hill Ironworks, near Dudley; 118, Queen Victoria Street, London, E.C.; and 126, Stephen's Green, Dublin.

ANTHRACITE SMOKELESS COAL. The Gwaun-Cae-Gurwen Colliery Co. (Ld.), (Incorporated in England). Established Half a Century.

The largest producers of Anthracite Coal in the United Kingdom, supply the purest Anthracite for Horticultural purposes. COLLIERY OFFICE:—LANELEY, SOUTH WALES. London Offices and Depot, 3, Mileage Station, Fiddington, W. The G.C. & C. will be pleased to furnish on application the names of Coal Merchants from whom their Coal can be obtained, as inferior Anthracite is often sold as theirs to new buyers. References permitted to some of the first Horticulturists in the country.

GARDEN HOSE.

HOSE AND REELS, WATER BARROWS, GARDEN ENGINES, TUBE WELLS and WATER PIPES LAID ON IN GARDENS. GARDEN ROLLERS, PLANT TRUCKS, WHEELBARROWS. ROSEBRIES, ROSE FENCING, GARDEN ARCHES, HANGING BASKETS, WIRE WORK SCREENS, WIRE TRELLIS, &c.

R. HOLLIDAY, HORTICULTURAL IRON and WIRE WORKS, BEAUFORT STREET, CHELSEA, S.W.

SEEDS.

LONDON: August 4.—Messrs. John Shaw & Sons, Seed Merchants, of 37, Mark Lane, E.C., write that the seed market to-day was of quite a holiday character, and very little business was transacted. For sowing white Mustard there is a good demand, and prices are consequently rather high. New Triticum 16s. 6d. offering at very moderate figures, orders from the country are coming forward freely. The recent advance in white Clover is well maintained, owing to the adverse reports of the new crop which continue to be received from Germany. ... Rape seed also moves off slowly at late rates. Feeding Linseed is steady.

CORN.

MARK LANE: Aug. 2.—This being a Bank Holiday there was no business done on the Corn Exchange. Aug. 4.—The market opened with a very thin attendance, and extreme dullness. There appeared to be a foregone conclusion that nothing was to be done, and virtually nothing was done throughout the day. Wheat could only have been forced off at cheaper rates. Flour was in about the same position as Wheat. The imports of Wheat and Flour into London this week are fair, but into the Kingdom last week they showed a further decrease, and again fell considerably short of last year at the corresponding period. For spring corn prices remained nominal in the absence of sufficient business to test the current value.

FRUITS AND VEGETABLES.

COLUMBIA (East London): August 4.—Good supplies continue to arrive, and meet with a good demand at fair rates. Prices:—Cherries, 2s. to 2s. 6d. per basket; red Currants, 2s. to 2s. 6d. per sieve; black Currants, 2s. to 2s. 6d. do.; Apples, 1s. 6d. to 2s. per half sieve. Vegetable Marrows, 2s. to 3s. per dozen; Scarlet Beans, 3s. 6d. to 4s. 6d. per sieve; Cabbages, 3s. to 4s. per tally; Peas, 2s. 6d. to 4s. 6d. per bag; bunch spring Onions, 4s. 6d. to 5s. 6d. per dozen bunches; ditto Carrots, 2s. do. STRATFORD: August 3.—The market has been well supplied, and a fair trade was transacted at the undermentioned prices:—Cabbages, 2s. to 4s. per tally; Turnips, 1s. 6d. to 2s. per dozen bunches; Carrots, cattle feeding, 1s. to 2s. do.; Apples, 2s. 6d. to 3s. per bushel; Cherries, 1s. 6d. to 6s. per half-sieve; berries, 1s. 6d. to 2s. per half-sieve; ditto 3s. to 4s. per bushel; Apples, 1s. 6d. to 2s. 6d. per half-sieve; green Peas, 3s. to 5s. per flat; black Currants, 3s. to 3s. 6d. per half-bushel; do. red, 2s. 6d. to 3s. do.; Cucumbers, English, 1s. 6d. to 3s. per dozen; Marrows, 1s. 6d. to 2s. 6d. per dozen; Broad Beans, 2s. 6d. to 3s. per bag; Scarlet Beans, 4s. to 6s. per bushel.

POTATOS.

BOROUGH AND SHTALFIELDS: Aug. 3.—There were good supplies, but a slow trade at late rates. COLUMBIA (East London): Aug. 4.—Quotations:—Essex Regents, 3s. to 4s.; Myatts, 4s. to 4s. 6d.; Shaws, 3s. to 3s. 6d.; Jersey, 4s. to 5s.; St. Malo, 3s. to 3s. 6d. per cwt.

STRAFORD: Aug. 3.—Quotations:—Early Rose, 65s. to 75s.; Hebron, 88s. to 90s.; Regents, 110s. to 120s. per ton.

HAY.

WHITECHAPEL: Aug. 3.—Supplies fair, with an exceedingly dull trade. Quotations:—Clover, prime, 90s. to 108s.; inferior, 70s. to 85s.; hay, prime, 70s. to 91s.; inferior, 45s. to 65s., and straw, 27s. to 37s. per load.

Aug. 5.—There was a good supply on sale. The trade was dull, at late rates.

CUMBERLAND (Regent's Park): Aug. 3.—A large supply, but few buyers, and prices in favour of buyers. Quotations:—Clover, best, 90s. to 103s.; seconds, 75s. to 85s.; hay, best, 84s. to 94s.; seconds, 70s. to 80s.; and straw, 30s. to 36s. per load.

STRAFORD Aug. 3.—Quotations—Hay, 80s. to 110s.; Clover 90s. to 110s., and straw, 30s. to 35s. per load.

Government Stock.—Consols closed on Tuesday and Wednesday at 101 1/2 to 101 1/4 for both delivery and the account. The final quotations of Thursday were 101 1/2 to 101 1/4 for both transactions.

THE GARDENERS' CHRONICLE

(Established 1841)

CONTAINS ARTICLES ON ALL DEPARTMENTS OF

GARDENING, PRACTICAL AND SCIENTIFIC,

REPORTS of EXHIBITIONS, REVIEWS of BOOKS, and NOTICES of all HORTICULTURAL MATTERS of CURRENT INTEREST.

HOME, COLONIAL, and FOREIGN CORRESPONDENCE.

Special attention is given to the following subjects :-

established Freehold Nursery and Florist Business,
owing to a retiring partner. Capital required, about £4000; of
the whole to be SOLD as a going concern—Apply, personally or
by letter, to J. C. JENNINGS, Priory Nursery, Acton
Lane, Chiswick.

Seed Trade
WANTED, a PARTNER, in an Estab-
lished Business—X *Gardener's Chronicle* Office,
41, Wellington Street, Strand, W.C.

Nursery Partner, Working
WANTED, NURSERY WORKING
PARTNER, with some Capital, to develop a Pro-
sperous Nursery—N. P. *Gardener's Chronicle* Office, 41, Wel-
lington Street, Strand, W.C.

WANTED, as HEAD GARDENER,
an active and energetic young Man; unmarried. Ex-
perienced in all branches, and of good address—Apply with full
particulars to AGENT, Crosswood Estate Office, Aberystwith.

WANTED, WORKING GARDENER, in
the Country, where there is only a Greenhouse with
Vines in it, and Cucumber Frame. The family are generally
to reside from middle of July to middle of October, during
which a full supply of Vegetables, Fruit and Flowers are re-
quired. Assistance given while family at home, and at other
times when required. An honest active married man, age 30 to
40, who can have a personal character for efficiency and
industry from a single-handling place—Apply by letter to Z. 9,
Hill Street West, London.

WANTED, a FOREMAN, to take charge
of the Houses—single; thoroughly experienced in
Fruit and Plant Growing for Cut Flowers. Steady, active, and
energetic. Good testimonials required. Bothy.—D. C.
FOWELL, The Gardens, Powderham, Exeter.

WANTED, a good OUTDOOR WORKING
FOREMAN, one well up in General Nursery Work,
especially Fruit Trees and Roses—Apply with references, wages
required, &c., to JAMES JOHN FOSTER, The Nurseries,
Sutton, Surrey.

WANTED, a thoroughly practical young
married MAN, of good business habits (must be fully
competent in the Management of Men), to proceed to Belgium
to take entire charge of large extent of Glass for the production
of Fruit, &c., for 3 or 4 months. Encouragement will be given
to a man whose energy and success merits it.—Send full par-
ticulars to H. CANNELL and SONS, Swanley, Kent.

WANTED, a young MAN, who has had ex-
perience in Growing Orchids and Greenhouse Plants.
Must be a neat and methodic workman.—JOHN LEMAN,

HOLLOWAY'S OINTMENT and PILLS.—A frequent cause of Gout and Rheumatism is the inflammatory state of the blood, attended with bad digestion and general debility. A few doses of the Pills taken in time are an effectual preventative against gout and rheumatism. Any one who has an attack of Gout or Rheumatism, or who is troubled also, the powerful action of which, combined with the operation of the Pills, must infallibly effect a cure. These Pills act directly on the blood, which they purify and invigorate. Having once subdued the severity of these diseases, perseverance with the Ointment, after fomenting the affected joints with warm brine, will speedily relax all stiffness and prevent any permanent contraction.

Also 100 Lots of 200 Established ORCHIDS in variety, the property of J. Gremont, 200 Seeds of VEITCHIA JOHANNIS, from Fiji Islands, &c. On view in usual of Sale, and Catalogues had.

FOR IMMEDIATE DISPOSAL, a FLORIST'S BUSINESS.—The Proprietor of a large and highly lucrative business, in full swing, which has been established for over twenty years, and is beautifully situated in the main road, Bayswater, known as Bayswater Hill, and commands the traffic from the principal entrance to Kensington Gardens, is desirous of disposing of the same. There is an unexpired term of fifteen years to run of the present lease, at an exceptionally low rental, and the trade return represents a large amount per annum. The books show various records of Royal patronage, and a clientele which includes a great number of the Nobility and Gentry of London, and also numerous Country patrons. It is situated in a quiet and desirable position, and is highly recommended as a first-class investment. It is especially suited to a partnership where the combined energies of two or more persons would be of great increase, as a large portion of the business is in Ball and Roul furnishing, and in the ever increasing demand for floral decorations in refined society at the present time. The business is a stock plant, goodwills, and lease, will be sold together as a gang concern, as the Proprietor, being practically single-handed in the management, now finds it much too great a strain upon him, and he wishes to retire in consequence of ill-health. Further particulars will only be furnished to Principals or their Solicitors. Apply to J. A. KING, 20, Queen's Road, Bayswater, London, W.

TO BE LET, a FARM, near Tonbridge Wells, containing about 200 acres of good sound land, in excellent condition, convenient for the Railway, and Cottages, Adjoining a Junction Station on the Main Line to London. This is the cheapest and best Farm in the neighbourhood. Apply to Messrs. LANGRIDGE, Land Agents, Tonbridge Wells.

To Landed Proprietors, &c. A. MCINTYRE (late of Victoria Park) is now at liberty to undertake the FORMATION and PLANTING of NEW GARDENS and PARK GROUNDS and REMODELLING existing GARDENS. Plans prepared. 15, Lastria Park, Stamford Hill, N.

To Noblemen and Landed Proprietors. H. HAWKES, of Great Queen Street, Westminster, S.W., is prepared to execute the whole PREPARES DESIGNS for Laying out New Gardens, Parks, Lakes, Roads, &c., or for Altering Existing Grounds. Estimates supplied.

SILVER SAND.—2 1/2 per truck of 4 tons; Best, 5s. 6d.; 2nd, 5s. 3d.; 3rd, 5s. 0d. per truck of 4 tons; ORCHID MOSS, &c. W. SHOLT, Horticultural Co., Midhurst, Sussex.

TO SEEDSMEN, FLORISTS, &c.

THE Gardeners' Chronicle.

SATURDAY, AUGUST 14, 1886.

ROOTS AND THEIR WORK.

THE following is the text of the essay to which the First Prize was awarded in the recent competition among young gardeners instituted by the conductors of this journal. The prizes were announced at the Provincial Show of the Royal Horticultural Society at Liverpool, by Sir Trevor Lawrence, Bart., M.P., the President of the Royal Horticultural Society, the First Prize being allotted to Mr. Sewell, late of the Royal Botanic Gardens, Edinburgh, whose essay, with its accompanying illustrations, are here reproduced with as little alteration as possible. It will be remembered that the term root was to be taken in its widest garden significance, and that special stress was laid on evidence of personal observation as contrasted with book-knowledge:—

Any one who has had under his care a considerable number of herbaceous or alpine plants will know how much he has been helped in growing them successfully—selecting suitable soils and positions for them—by having observed their British allies growing wild in fields and woods, by streams, or in bogs.

Some such knowledge of our "wild flowers" helps us even in the culture of greenhouse and stove plants; indeed, knowledge derived from the careful observation of any one plant in its natural home cannot fail to be of aid in teaching us how to grow any plant in our gardens.

But further, if by carefully comparing several plants together, we in time were able to determine, fairly correctly, from the appearance of root, of stem, and of leaves, as to the habit of the plant, as to its likely home—what an advantage this would be to us in our horticulture.

We believe that to a considerable extent this can be done, and the object of this essay is both to describe carefully the most common forms of roots, to tell what is the relation of the various roots to the rest of the plant, and then to try and reap facts of practical value to horticulture from the foregoing more purely botanical ones.

We are too apt to disassociate botany and horticulture; some of us seem to think them almost antagonistic; but surely any true fact regarding plants—their development, organs, or habit, such as are comprised in the science of botany, must be of more than slight interest to those of us who have to deal practically with so many varied forms belonging to the great vegetable kingdom.

Lately there has been in very many gardens a great amount of talk and argument as to what a root is, and what it is not. Intending essay writers have been nearly overwhelmed with assurances as to the complexity of the subject, and of the exceeding great difficulty which the ordinary mind would have in endeavouring to understand anything definitely as to the nature of a root. I feel sure that those who have been so discouraged have been torturing themselves

over terms and over the meaning of botanical words, rather than seeking themselves to examine the thing itself—the roots we all know so well, and which in our earliest days we had no difficulty in recognising.

FORMS OF ROOT.

I purpose to treat in the following pages of those downward directed—generally colourless growths, either stringy or very much branched, but always having some part soft and seemingly porous in its nature, which would be called “roots” by any ordinary person. I shall later have to refer to the more exact meaning of the word as understood by botanists; but I will attempt at present no definition of “a root,” but first examine several such structures as I have indicated, and see what parts they have in common; we may then be able to place limits as to what shall be “root” and what “stem,” &c.

Roots penetrate the earth, the water, the tissues of other plants, or they grow on the surfaces of damp substances without entering into their substance; at times hanging in the air, and often growing first in the air, eventually penetrating the ground, and branching profusely. These kinds of roots are commonly grouped under the heads of:—Terrestrial, in earth (and water, submerged), most commonly; parasitic, on other plants, as Dodder, Broomrape; epiphytic, as among Orchids; and aerial or adventitious, e.g., Orchids, Banyan, Mangrove.

THE SIMPLEST ROOTS.

We will concern ourselves chiefly with ordinary terrestrial roots, and will first examine the very simplest forms we can meet with.

There is a well known plant which grows in semi-stagnant water, called *Spirogyra* (also called *Conferva*), composed of green thread-like growths. If we could meet with this growing on the sides of a glass tank in any cool-house we should easily see little swellings at the base of the threads, which served to fix the plant to the glass. The swellings might be likened to small suckers, and of course we should not think of attaching any other function to them than that of keeping the plant in its place—anchors, in fact. Several seaweeds have similar though larger roots, and we may see at times washed up on the shore a stout stem with a swollen base somewhat in the shape of a hand with shortened fingers, the more able so to attach itself to stones, &c.

Leaving the *Spirogyra*, then, we look at a plant of that great pest in gardens—the Liverwort (*Marchantia*). I should place this next, as affording a good example of a very simple root, though widely differing from our last. Attached to the under surface of the plant, which resembles a narrow, ribbon-like leaf, are many delicate hairs. These hairs the microscope shows to be single cells. They may vary much in length, but whilst serving to attach the plant to the damp wall or place where it may be growing, we may well judge them able to perform other work—that is, to supply necessary fluid for the plant's food, the manner of which feeding process we shall consider later on.

We will look again among water plants for our next root—that of the Duckweed (*Lemna*). That it is not composed of one cell, but of many, we can see with a pocket lens. It is not branched, however, which is the case with many others growing about it, or as is the *Pontederia*, a stove aquatic, which we shall refer to again as a good illustration of some points of root-structure.

Lemna, or, perhaps better, some branched aquatic, reminds us at once of the first roots of all seedlings, but we must remember that the root of an ordinary seedling is imperfect, and may develop very differently in growing.

As we notice at once a difference among seedling plants in regard to their leaves, so we find an accompanying difference among their roots. Plants which germinate with one seed leaf as a rule, if not always indeed, produce several fibrous roots from points variously apart from one another. Plants which send up two seed leaves produce, at least at first, a single fibrous root,* from which sooner or later secondary roots branch off. Palms and grasses are examples of the first kind; *Asters*, *Calcarias*, &c., of the second.

In a *Clintonia* (of the first class, monocotyledons) which I examined lately there were four or five long

roots reaching down among the crotches. New leaves were just forming, and another half-dozen or so fresh roots were beginning to lengthen out. I am not sure whether the first series of roots were decaying, but among all bulbs (also of this first class) one set of long unbranched roots only lasts one growing season,

the straight “first root,” we are accustomed to meet with in seedlings; closer examination, however, showed me the newer root starting from higher up, and so I knew that my seedlings were at least likely to grow. I think perhaps this decay of the “first root” may be common amongst plants which are to form no stem or are of running habit.

We notice then this power of “first roots,” giving off branches among plants which germinate with two seed leaves (dicotyledons). It may be a longer and shorter time before this occurs. This will depend on the nature of the plant, or on the nature of the position in which the seed germinates.

I believe that plants which make a rapid growth as a rule send long first roots into the earth before giving off branches; among trees especially this is the case. Examples:—An acorn kept in a sealed bottle in a warm place sent out an unbranched root for I believe a couple of feet before it produced leaves. This was, however, under abnormal conditions.

Among eight or nine *Plane tree* seedlings which I experimented with in different soils, four grew with very little side branching indeed for several inches, when in moist easily penetrated soils, as loam, leaf-mould, sand. No. 5, grown in ashes, and perhaps broken at the tip, sent out four fairly strong root branches. No. 6, grown in water and broken at the tip, branched excessively, even producing a “third series.” No. 7, grown over water, half in, half out, where the tip could not develop itself, branched excessively, like No. 6, but the branches cling to the rounded inside surface of the pot the seedling was suspended in, thereby differing from the root-branches of No. 6, where the “branches” all turned away from the light as I judged and were straight and stiff.

It is further exceedingly interesting to note that in No. 7 root-fibres were abundantly developed on those portions of the root branches which, without being in the water, were clinging to the damp pot just above the surface.

It may make these details of the experiment easier to be understood if I explain that I piled several small pots one fitting into another as a support to a piece of cardboard placed over the surface of some water in an inverted bell-glass. The root of No. 6 was slipped through the cardboard which held the “neck” of the seedling. The root of No. 7 was also placed through the cardboard, but at the same time placed through the hole at the top of the inverted pile of small pots.

The greater part of annual plants give off branching roots—in grass feeders the branching is excessive—and nearly every part of the root is fibrous. Little spreading plants, as *Spergula*, too, will need to branch fairly well near to the soil so as to get the best supply of nutriment possible with the least growth of root.

While mentioning *Spergula* we should here note the very long hairs on its delicate roots. These hairs are present on every plant, from the largest tree to *Marchantia*, as we have seen, unless, indeed, the roots are submerged as in *Lemna* or *Pontederia* where there is no need for them. They vary considerably in length and thickness, but they have always thin walls able to admit water through their tissue.

Nepenthes root-hairs (or “fibrils”?) seem all connected with the surface cells, and under the microscope for the sake of clearness might be likened to the protruding ends of cords from a rope made up of innumerable such cords.

We must now leave these simpler forms of root—either fibrous, not much branched, or very much branched indeed—and notice other forms.

In *Imantophyllum* we have many long roots appearing to grow like those of monocotyledons (being nearly unbranched), but much swollen, therefore exposing much surface for the absorption of water, and between this and the roots of a first year's seedling, as in the *Clintonia* before referred to, we have all imaginable grades of thickness and length.

Again, we have thickenings of the “first roots” of dicotyledons, such as we meet with in *Dandelion*, *Papaver*, *Cheiranthus*, *Capella*, and a host of others. This thickening makes the root have a firmer hold of the soil; it enables it to send off root branches the more vigorously, and in such examples as alpine species of *Astragalus*, *Phyteuma*, *Silene*, and a host of well known alpine plants which grow among rocks or in crevices; the pressure exerted by the growth of the root wedging itself between two masses of rock is invaluable to the plant where, were the root not so firmly held, the weight of the leaves, stalks, flowers

FIG. 47.—TUBER OF ARGEMONE.

being replaced by another series from about the same place the next year.

It is interesting here to note that many *Primulas*, and I suspect most other stemless or nearly stemless plants belonging to the second class (dicotyledons), lose their “first root,” and a number of fibrous roots (able to branch, however) are given off from the crown, i.e., where the first leaves are, or from some point in

FIG. 48.—TUBER OF GANERUM.

the over-present longer or shorter “stem” which supports these leaves. This stem is the upward continuation of the first root—in bulbs and grasses found in the form of a flat plate from which the roots proceed.

I cannot remember in what species of *Primula* I first especially noticed this decay of the “first root,” and consequent rooting from the crown, but I was rather annoyed to find that seedlings of a rare Indian species, through having been sown too near together were “damping off at the roots,” or rather had lost

* Called throughout this essay the “first root.”

would at times pull the plant quite away. We may remark that this kind of root is very general among plants which die down to the ground in winter, which plants send up leaves or stems each succeeding year.

Annual plants never have much more than fibrous roots; in some cases the first root is considerably thickened where the habit of the plant is such as to require considerable support.

All roots which last for a number of years will thicken or harden, some thickening very gradually, some evenly throughout a considerable length, others very abruptly. We have examples of all these varied forms of root thickening in Cabbages, Statice, Carrots, Radishes, Turnips, Cyclamen—in the last named being swollen in breadth and of no great length, giving it the characteristic flattened appearance so well known.

It is not our purpose to notice whether in some of these, as Turnips and Carrots, it is the "first root" or the stem which supported the seed leaves which has become swollen. Those forms of thickening are to be met with among roots in all variety.

We may assume that all roots which do not die away either the first or second year will thicken considerably. Biennial roots often thicken by a storage of food for next year taking place within them. Roots, such as are to be met with in nearly all kinds of trees, increase year by year, wood being formed within the bark as it is in the stems of such.

From all these much hardened or lengthened roots, however, root branches are given off, which in turn may branch until delicate roots such as were first seen in the seedling are given off, these finest ones being covered with the more or less delicate root-hairs (fibrils) which we noticed earlier.

Instead of one more or less gradual thickening of the first root or its root branches there may occur three or four thickened parts of the root, somewhat as if several large oval beads were irregularly connected by one string. This is met with in *Drosera spiræa filipendula*, and I have also seen a somewhat similar formation in *Antigonon*.

Small, globular, pea-like swellings are constantly present on many plants of the Vetch family (*Ulex*, *Genista*, *Lathyrus*). Allied forms of swellings are seen on *Encephalartos* and even on *Ixora*. Those on *Encephalartos* grow several together, and look not unlike a piece of discoloured sponge or soft coral. In both these latter cases it is probable that there is some storage of food in the cells of the swelling. [These swellings are sometimes associated with the growth of a *Myxomycetous fungus*. Ed.] I have noticed starch in those of *Ixora*, but not very plentifully. Little bladders occur on the roots of *Utricularia* and *Pulsillaria globularis*. These serve to float the root, both plants growing in water.

TUBEROUS ROOTS.

The Dahlia is an example of a plant having several thickened roots depending from the stem, from which small fibrous roots are given off, especially at the lowest point, where the change in its thickness is very abrupt. The Dahlia is a root for storing material in; it grows in a different position from the Potato, to which one would at first be inclined to liken it. There is considerably more fibre in the Dahlia and much less starchy matter. The Potato "tubers" branch off from stems (as shown in *Gardener's Chronicle* some years ago; or, from underground stems, which latter, I fancy, are much like roots in structure and outward appearance.

Tubers, however, of *Begonia* seem exactly similar to a swollen root, such as we have in *Cyclameo*, except for the fact that in many points on its surface are swellings afterwards to develop into leaves and stems (fig. 37, p. 198). *Gesnera*, also, as shown in an accompanying sketch, has similar swellings given off from the tuber, also from the stem immediately above (fig. 38, p. 198). *Oxalis hirta* (fig. 40, p. 201) has a swollen bulb-like root, while smaller undeveloped bulb-like growths appear at regular intervals on the stem above (fig. 40, a, a, a), growing much as leaves and scales would. Fibrous roots also are given off from this upper stem. The *Oxalis* family is a good instance of very varied roots among the same class of plants. An illustration is appended of the fleshy, swollen root of *Oxalis purpurea* (fig. 39, p. 201).

Tydea further seems to have in the upper part of its root a collection of scales growing from a thread-like fibre; whilst *Cephalis ipeacuantha* has a somewhat similar root, called annulated, it appearing to be "ringed" throughout a greater part of its length.

BULBIOUS ROOTS.

There is a great class of underground growth, various forms of which we call roots, or bulbs, and corms, somewhat similar to the tubers of the Potato we just noticed.

Bulbs we may dismiss at once. They have roots growing from the "plate" or more solid part at their base, which root we have referred to when treating of monocotyledonous roots. The bulbs are seen to be leaves more or less closely growing together, as in *Lilium auratum* or in *Allium* (see fig. 41, p. 201).

CORMS AND TUBERS.

A "corm" is the name given to the fleshy expansion, much like bulbs, around the stem or central column, as met with in *Gladioli* or *Crocus*. They also have fibrous roots given off from a ring at their base, which ring is the outermost part of the "plate," showing in its centre the sort of "callus" left by severing its connection with a previous year's corm.

Terrestrial Orchid roots I should have referred to earlier. They are of many shapes, either quite round, or shaped like the palm and fingers of a hand. Like the swollen growths so well known in *Ranunculus Ficaria*, they serve to store up nutriment. (The latter remarkably resemble Potatos in this respect—that from any one of them fresh plants will grow; they are also borne in the axils of the leaves, as well as produced underground.)

The fibrous roots of Orchids, and the similar growths of *Ranunculus Ficaria*, are both accompanied by fibrous roots, which are the true feeding parts of the plant, the growth in *Ranunculus* not being considered as really roots.

RHIZOMES.

We have in addition to all the foregoing kinds of roots and similar structures, a large number of growths which partly resemble a root and partly resemble a stem, growing upon or under the ground. We will not treat of these in any detail; they so essentially differ in most cases, when somewhat closely examined, from any root as developed from the seed, or from parts of the stem, when also these branch off.

We have for example *Petasites*, *Lysimachia verticillata*, also many Ferns, as *Pteris* and *Polypodium*; but also many Ferns buds only are given off from their extremities.

We might note as differences between these structures and roots—

A. They develop leaf-buds, or extremities eventually appear above ground.

B. If slit up with a knife most are filled with pith, which we never notice among ordinary roots.

C. Often these growths are jointed and ringed as the stems of the same plant, as, for example, *Equisetum* and *Mentha*.

They grow on various forms along the ground, as in *Iris*, when they are called rhizomes; as suckers from below the ground on *Roses*. The runners of *Strawberry* or of that very interesting little alpine, *Saxifraga flagellaris*, are more easily recognisable as stems, although, like roots, they turn towards moisture and the earth.

VARIOUS OTHER FORMS.

All of these develop fibrous or more thickly swollen roots from various places throughout their length.

We have many swollen roots or stems resembling roots of large size or twisted curious shape, as in *Ipomæa*, sp., from the Tropics, and *Testudinaria*. They evidently serve as store places for food, or may be useful to counteract effects of continued droughts.

Roots may differ greatly in shape according to the position in which they grow. Roots of *Chlorophyton Sternbergii*, instead of being green and little more than fibrous, become white and quite fleshy, like small white Radishes, when grown in the ground.

ROOTS OF PARASITES.

Roots of parasites we cannot well see without a microscope and careful dissection. They will enter the central tissue, and abstract nutriment from thence.

Of aerial (adventitious) roots we have many forms. They generally are so provided that they can abstract nutriment from the moisture in the atmosphere in which they grow. In *Monstera* I have noticed two sets of these roots; some smaller ones held the stems to a base up which it was climbing—larger ones, like rods, grew straight to the ground and branched there, the latter chiefly supporting nutriment.

(To be continued.)

New Garden Plants.

DENDROBIUM WILLIAMSIANUM, *Rehb. f.*

WHAT a pleasure it is to make at last a personal acquaintance with a friend. This species was discovered by Mr. Goldie on or near New Guinea as early as 1877. Plants and dried flowers and a sketch came then into the hands of our excellent veteran, Mr. B. S. Williams, who is well known to have an especial hobby for *Dendrobium*. When I published the description, in the *Gardener's Chronicle*, 1878, May 25, p. 652, I said: "A certain kind of a sketch that I cannot fully admire." The lip was represented as depending [pendulous], which was an offence to my orchid feeling.

Now, after so long a time, Mr. B. S. Williams has succeeded in getting the plants of 1878 to bloom—an excellent work indeed. A grand peduncle bears five flowers which are as large as those of *Dendrobium Dalhousianum*, but with the shape of those of the biggibum tribe. I could not help thinking a moment of *Aganisia cyanea*, so comparable are both *aurora* and texture of the flowers. The chin is neatly angulate, with another angle standing in front. The oblong sepals and petals are light pinkish, petals washed on the disc with light purple. The lip is upright, appressed to the column, blunt rhombic, channelled on the midline of the underside, purple, with two whitish, roundish areas, one on each side of the base. There run three low keels from the base to the anterior disc, where they rise in three much higher dark rhombic keels. The column is mottled and freckled in front with numerous purple spots under the fovea, and the lower dark purple region is interrupted by a light zone, angulate in mid. Anther purple, white at the base.

Decidedly it is a noble beauty. Mr. B. S. Williams must be congratulated on such great success, quite useful to inspire in us these days of energetic, sometimes too energetic, competition. *H. G. Rehb. f.*

DENDROBIUM FOGONIAE, *n. sp.**

This is a tiny botanical curiosity, nothing more. I was kindly sent me by Mr. James O'Brien, of Harrow-on-the-Hill, who informed me that it came from North Borneo. It has the habit of a miniature *Dendrobium fimbriatum*, 1 foot high. The flowers, on arrival, were light yellow with an orange tip. The growth from *Dendrobium sphegiodoglossum*, *Rchb.* (*strigosum*, Lindl.), its nearest ally, are very much like. The mentum forms a much longer retuse cylinder. The lip has a long projecting mid-lobe with much longer fringes and hairs, and no hippocrepic callus at the top, being quite even. The column has not the long groove in front under the stigmatic hollow, but it is divided at the base into two shanks. I obtained subsequently a piece with two young shoots, which are almost fusiform, with linear-lanceolate leaves, unequally bilobed at apex. *H. G. Rehb. f.*

ZYGOPETALUM LEOPARDINUM, *n. hybr. Angl., Hort. Veitch.*

Quandoque bonus dormitat Homerus! Mr. Seden has raised this lovely gem at the Royal Exotic Nursery of Messrs. J. Veitch & Sons, but the *certificat d'origine* is not to be had, in spite of the careful Sedenian habits. It is a novel thing, that you see with pleasure. The sepals and petals are light greenish-yellow, with very numerous small cinnamon-coloured spots, some oblong, some hystericlyptic. On the outer surface they are pale, yet showing the spots in the same manner as in the leaves of a *Vriesea muscica* or *Morrenii*. The inside reminds one of an *Ansellia*. The lip consists of an epichile and a hypochile. The latter consists of the two angular side-laciniae, which are quite connate, with an apparently nearly flat, broad callus, bearing its thirteen teeth in front, and furrowed near the anterior margin. This callus is

* *Dendrobium (Strobilium) fogoniae*, n. sp.—*AE* ac perisperm. *Dendrobium sphegiodoglossum*, *Rchb. f.*; racemis capillariis paucifloris; bracteis ovatis apiculatis ovaria pedicellata dimidio subaequantibus; sepalis triangulis lacinis mento cylindrico retuso ovarium pedicellatum dimidium subaequantibus; petalis cuneato-oblongis, acutis auris mirate denticulatis; labello cuneato-anteo dilatato inflexo, lacinia laterali oblongo ciliata, lacinia antica mediana producta oblonga valde barbata callosa; columna hastiformis emplexiter bicurva nec antro fore munia. Flores albi-rosei. *Labelium aurantiacum.* Ex *Erpeno* Borneo, Ed. J. James O'Brien. *H. G. Rehb. f.*

ochre coloured, with deep mauve ridges and teeth. It is by no means such an upright wall as in *Zygotetium maxillare* and obtusatum (till 1886 Sir Trevor's monopoly, but which has now appeared with Mr. F. Sander). It reminds one of some Warscewiczellans and Pescatoreas. The epichile is a transverse obtus-angular cordiform blade, of the warmest purple-mauve, exceedingly beautiful. The column is of a reddish-mauve, and has two small auricles, one on each side of the fovea. No doubt Mr. Harry Veitch is right when speaking of *Zygotetium maxillare*, but which was the other parent?—perhaps *Zygotetium Burketi*. If Mr. Seden would help us in these mules we might come to the point. The leaf is narrow. Bulbs were not sent. We do not wonder at that! *H. G. Rehb. f.*

A TRIP TO CHIRQUI.

(Continued from p. 167.)

We left the Mission early on the Friday morning and proceeded to make our way down the river. All the rapids were passed successfully, but not without considerable trouble, as the river, which, on our way up, was swollen with the tropical rains of several previous days, had now subsided to its ordinary level.

Specimens of a splendid scarlet *Passiflora* (*Passiflora vitifolia*) were seen and collected at a bend of the river where it overhung one of the eddying pools so frequently met with. It is known to the natives as the "Caboona," but as this name is applied indiscriminately to several species, it could not alone be recognised by that appellation. I found several species of this class of plants in different localities, one among them being of special interest as it produced fine large edible fruit, similar in appearance to that of *Passiflora laurifolia*, L., the Pomme d'Or of the French West India Islands, but over twice the size. This together with one very much smaller was also known as the "Caboona."

On reaching that portion of our route where the surrounding district consisted of flat alluvial we noted several extensive Banana plantations. I was informed on reliable authority that from the time of planting to the production of fruit only some nine or ten months were required, and the plants from their thriving and luxuriant appearance would assist to bear out this statement. They were planted in straight rows some 10 to 12 feet apart, and were producing enormous bunches of splendid fruit at the time of our visit. So productive are these plantations becoming on this and other rivers in the locality that large steamers begin to come in regularly to load for the American market, and when it is considered that the depth of water in the lagoon is sufficient to allow them to come to within easy distance of an hour or a hour and a half's journey by canoe, it will easily be seen what a profitable business it is likely to become in the near future. The transit of the fruit from the plantations to the steamers is all performed by large Cedar canoes similar to the one in which we were travelling, or in larger ones dug out from the enormous Cotton trees.

Rice was growing wild on the river banks, and appeared to be of good quality.

Several large Cane fields were also seen, and Canes 15 to 20 feet high were common objects.

We landed about noon at Mr. Riley's house, and we were invited to take a walk along the adjacent property situated on the shores of the lagoon. Here again we found the "Soopa" was highly esteemed, and numerous specimens were under cultivation. Vanilla was also a common plant, as well as in the majority of places visited, and though but little fruit was seen, the vines bore traces of recent abundant crops. It is cured here by simply drying in the sun, the pods being gathered when full, and before they commence to turn yellow. We brought some home with us, which in aroma was far preferable to that usually purchased. The pods were not so long as those of the ordinary commercial kind, so that it is probably a different species, or possibly a variety only of the commercial article.

Several Ferns were noticed, and the herbage on the beach consisted principally of the salt loving sedges, interspersed with *Eleusine* and *Stenotaphrum*, both good pasture grasses.

Near the house was a large leguminous tree, which was here known as the "Guanga," but though it bore considerable resemblance to the tree known under that name in Jamaica, it was not the same. It is a tall umbrageous tree, with bijugate leaves and

brown hairy pods, somewhat falcate in outline, and 6-8 inches in length. These, when open, are found to contain a sweet mucilaginous pulp, which envelops the seeds, which when freed from their covering were of a chocolate colour. The pulp much resembles that covering the seeds of *Theobroma*, and has a pleasant sub-acid taste.

There were also plenty of Cocoa-nut trees, which found a congenial home in the sandy soil of the beach, but on tasting them as "water Cocoa-nuts" we found that they were much inferior in flavour to those grown on the islands in the lagoon, but the ripe nuts are equal in size and quality to those grown in other places.

The land near the house consisted principally of swampy alluvial and, probably in consequence of the recent rains, exhaled an odour anything but pleasant. On putting a question to Mr. Riley as to the healthiness of the locality, we were informed that during a residence of sixteen years he had suffered about two hours illness only.

After a stay of some two hours we bade adieu to Mr. Riley, and embarked for our homeward voyage. Through the passage the lagoon is studded with numerous small cays, consisting of mere coral rock covered with Mangrove trees. The mention of Mangrove trees here reminds me that I have somewhere seen it mentioned that these plants appear to be of little economic value. It was my fortune, however, to notice a use to which they were put by a creole settler, which, to say the least, was very suggestive of the benefit they can be made to produce by a proper application of their powers of existence.

On an island in the lagoon, on the side affected by the most prevalent winds, a settler had a number of Cocoa-nut trees; he found that they were planted too near the water, and that in consequence they were being undermined and washed away by the surf. This was at a point between two small cays covered with Mangrove, and situated about a stone's throw from the land. He appeared to have conceived the idea that if he could plant a line of Mangrove in the shallow water so as to connect the two cays he would prevent the wash affecting his Cocoa-nuts. He therefore planted several rows of the tree in calm weather, and when we saw them they were thriving vigorously, and promised soon to present an effectual barrier to the wash of the sea waves.

We reached our quarters at about 9 A.M., after spending some twenty-six hours in an open canoe on the safest of waters.

The following day or two was devoted to the drying of the specimens already procured; but having fairly recovered from the effects of our journey, we were invited early one morning to "take a walk." This consists in taking a paddle in a canoe, probably for some miles. We accepted the invitation, and found that our guides intended to show us the provision grounds, &c., situated on "Nancy's Cay," in the chart "Solarte Cay." Here almost as soon as we landed we came upon thickets of *Bactris horrida*, the "Pork-and-dough-boy" or "Poke-under-boy" of the colonists. This name appears to extend for some considerable distance in Central America, but its origin is involved in no little doubt. From the use to which the plant is put, in the district we traversed, it would appear to be pretty certain that to that use it owes its derivation. The stems of the Palm are strong, hard, and some 12 to 15 feet in length, and about 1 inch to 1½ inch in diameter, and are the favourite rods used for propelling canoes when in shallow water, hence "Poke-under-boy"—the rods being used in a similar manner to the punt pole of English rivers.

We also met with another *Geonoma*, a small but handsome Palm, very similar to those we saw on the *Wari-Biarra*.

We also procured seeds of the "Samba Gum" tree. These were about the size of small Nutmegs, and, like them, were covered with a reddish arillus, or fleshy covering, much resembling the Mace of commerce. The "Samba Gum," when first produced from the tree, is a yellowish creamy-looking liquid, which after a time becomes hard and somewhat resinous, and when in that condition resembles the "Hog Gum" of Jamaica, the produce of *Symphonia globulifera*, if, indeed, it is not the produce of the same tree, for it has not yet been our fortune to obtain seeds and botanical specimens of the Jamaica plant.

There were several Tree Ferns and *Sclaginella*,

but the most curious was the singular climbing *Alsoiphila blechnoides*; this was present in large quantities, and in the single frond very much resembles *Oleandra nodosa*, Prl., of the Jamaica Fern flora, but the distinction is, however, very apparent upon closer examination. We also gathered *Ryania speciosa*, belonging to a genus closely allied to the *Passifloræ*, and a curious *Anonaceus* plant, probably a *Xylopia*, which exhalates a perfume very similar to the allied *Canaga odorata*, which gives the name to the celebrated "Canaga Water" sold by perfumers.

A day or two afterwards we bent our way, by canoe, of course, to the settlement of "Boques Month," formerly mentioned as the local name of what is known to navigators as Bocas del Drago, or Mouth of the Dragon. This settlement consisted of a few houses only, but its thriving condition will be indicated when it is mentioned that at the time of our visit a chapel was in course of erection capable of seating over 200 people, and that without any extraneous help. We noticed on the sea-beach an enormous tree of *Achras sapota*, the "Sapadilla," or "Zapatilla" locally, but the "Naseberry" of Jamaica. It was laden with fruit of very large size. Sea Grapes and Mangroves abounded in the more swampy districts immediately on the beach, but the inner lands were dry, and were producing vegetation of the ordinary tropical character.

Leaving Boques Month, we again came down the lagoon to the "haul over" near Bocas del Tora, on Columbus Island, and here we left our boatmen, and made our way on foot to the homestead of Pedro Lopez, one of the principal residents, to pay him a visit, and afterwards for a stroll through the bush.

We collected many specimens in the woods, the most interesting being a *Pteris*, a *Trichomanes* of very minute proportion, and an *Alchornea*. This latter was growing in a pasture at sea-level, and appeared to be the same species which is indigenous to the Jamaica hills, but is never found on the plains of this island. This instance has a parallel in the plants found by Mr. Morris growing on the sea-shore in British Honduras which in Jamaica are only to be found in the highest mountains. The fact has not been explained, but it is probable that were a careful search made into the microscopical structure of these plants, it would be found that their cells are constructed so as to render them more dependent upon a regular supply of moisture than upon a higher or lower degree of temperature. The humid character of the atmosphere is nearly constant in the localities in which these plants are found, and the rainfall in the two places is believed to be nearly equal in annual average.

The Banana plantations on this gentleman's property were examples of good cultivation. The ground selected for their growth consisted principally of a stiff yellow clay covered with black alluvial intermixed with innumerable sea-shells, through which the land-crabs are ever bringing up the subsoil to the surface, thus raising it gradually higher and higher above sea-level.

After a short trip through the woods, we again returned to the house. We soon got afloat, however, and two athletic Indians rapidly took us across the bay to Bocas del Tora. Here we were furnished with a canoe, and were soon speeding homewards towards Old Bank. Although the confidence of the boatmen tended to give us considerable nerve, we felt much safer on shore than we did in crossing the boiling cauldron of the Bull's Mouth, and we were very thankful to have succeeded in crossing it safely.

Next day we again went on a visit to "Solarte Cay," and discovered a very handsome dwarf Palm known locally as the "Kiss-kiss." It has a small stem 2-3 inches in diameter, and somewhat in appearance like a Sugar-cane. It has pinnate leaves finely cut at the base and abruptly terminated at the apex. It has a large spreading panicle, which before expanding is enclosed in a short, smooth, boat-shaped spathe. Here we found several *Adiantums*, a *Pteris*, and another *Trichomanes*, and procured seeds of the small Swallow-tail Palm seen on our last visit.

Next day we crossed to the town of Bocas del Tora, locally "Bocatora," with the intention of paying a visit to *Senor Pardon*, the "Political Judge," or person in authority for the district.

The remaining days of our visit were spent mostly indoors, on account of the very inclement weather

which prevailed at the time; but even during this time I was fully occupied in drying and properly preserving the specimens I had already secured. One of the specimens thus brought to us was the fruit of a *Passiflora*, called the "Wild Granadilla" locally. It was a ripe fruit 1 inch in diameter, bright scarlet in colour, having a very thin papery pericarp with light coloured transverse and longitudinal markings. It contained a very pleasant sweet pulp, and, being fully ripe, seeds were duly secured, and I am glad to say safely transported to this island, where they are now growing freely. It is a pretty species, and was found on a small island called Careening Cay, forming the tongue of the Bull's Mouth. Another plant of interest of which seed was brought to us was *Elais guineensis*, or the African Oil Palm, which has probably been introduced in a similar manner as it was

bags, &c., are manufactured. It has leaves sometimes over 10 feet in length, in appearance not unlike those of the "Penguin" of Jamaica, but the fruit of the plant is much more like the Pine-apple, as it rises on a stem 3 or 4 feet long from the crown of the plant, and the pips are aggregated together in a similar manner to that fruit. The bracts are much more distinct, bright scarlet, and close together, and the pips are much smaller than those of the Pine-apple, and not of such succulent nature. It is very handsome, and were it not for the somewhat unwieldy proportions of the plant producing it would be of some interest as an ornamental fruit.

The Bread-fruit was a tree we found abundant in all the islands, and was tended in every place with much care, as it is one of the favourite plants selected by the "We-We" ant for the display of its depredatory powers. It nevertheless thrives well, and produces fruit in abundance. "Cassava," as a rule, is not so prolific as in some of the drier districts in Jamaica, but it is generally cultivated by both Creoles and Indians. Tobacco is grown, but is of very inferior quality. Limes are plentiful, but Oranges are scarce, rendered so by the constant attacks of the "We-We" upon the leaves of the tree.

The Star-apple was fairly common, and several trees of *Blihia sapida*, the "Ackee," were in cultivation near the settlements.

were leaving we were presented with two enormous fruits of a superior variety. I immediately recognised this as being the true Smooth Cayenne, a variety which I have not as yet seen in Jamaica.

Inquiring into the history of its introduction into the islands, we were told that the plants were introduced from Jamaica. It is one of the best varieties that can be grown, and is highly esteemed, even when produced under artificial cultivation in English hot-houses.

I cannot take leave of this district without mentioning the immense tract of land on the interior mountains, which without a doubt possess a climate somewhat similar to the Jamaica hills.

Hence it follows that there is plenty of room for the cultivation of such products as Cinchona, Coffee, Tea, &c., while the coast districts are suitable for the

FIG. 39.—TUBER OF *OXALIS PURPUREA*. (SEE P. 199.)

FIG. 41.—SECTION OF BULB. (SEE P. 199.)

FIG. 40.—TUBER OF *OXALIS HIRTA*. (SEE P. 199.)

into Jamaica from the coast of Westero Africa. We also had a fruit of the true *Passiflora quadrangularis* brought to us under the name of "Granadilla." I had not seen the fruit of this plant for some twenty years, but it has often occurred to me that the name "Granadilla" was probably applied indiscriminately to the two kinds, *i.e.*, *Passiflora macrocarpa* and *P. quadrangularis*, the former of which is known and grown in Jamaica as the "Granadilla." The difference between the two varieties is not so much in the size and shape of the leaves, which are very similar, but in the different form, size, and flavour of the fruit [and specially in the construction of the flower. Ed.]. The fruit of *P. quadrangularis* is in size about one-third less than that of *P. macrocarpa*, more oval in shape, and of a darker green colour. It is much superior to the ordinary fruit known as the "Granadilla."

The fruit of *Bromelia pita* was also brought to us. This is the "Silk Grass" of the district, and is the plant from which all the Indian hammocks,

There is one variety of Cocoa-nut which is deserving of special mention. It is called the "green-skinned," and though to all outward appearance it is smaller than the ordinary kind, it is found that when denuded of its husk the nut is very much superior in size. It is apparently quite as prolific, the trees are as quick in growth and quite as hardy as the ordinary variety. The nut when ripe is about one-third larger, and is much handsomer than the common one. As water Cocoa-nuts they contain a very large quantity of liquid; one we had given us produced sufficient to fill a soda-water tumbler once and a half, and we were informed it was not selected for its extra size. It would be well for those who intend cultivating the Cocoa-nut in Jamaica if they were to seek a supply of this special kind, as without any doubt it is very much more valuable than the common variety, and would command a much higher price in any market.

A destructive animal in the provision grounds is the sloth, which is fairly numerous. It is a disgusting looking creature, and specially adapted in form for living in the branches of trees, &c. It is to be seen occasionally at mid-day perched upon the top of a bunch of Bananas or Plantains, leisurely eating them without any apparent regard to external objects, never leaving the bunch until it is entirely consumed.

Pine-apples of the several commoner kinds are in cultivation on the provision grounds; but just as we

growth of nearly all tropical products, &c. Cacao is at home in the tracts near the coast, and produces much finer beans naturally than can be exhibited by many other countries which expend a large amount of capital and labour in its production.

We landed in Colon in a pelting shower, and had the misfortune for the first two or three days to meet a continuance of the same weather.

I had heard much of Colon, but I never expected to see anything so bad as the state of affairs we found existing. It was not possible to cross the streets without the help of the numerous old packing-cases, planks, &c., that were lying in every direction. The streets are the receptacle for every description of rubbish, and the rain had reduced them into rivers of liquid mud, into which the drivers of drays, &c., were compelled to plunge to enable them to pass along, as the railway track in the centre of the street did not permit of their crossing except at certain points. In many places the streets were, for often as much as a hundred yards in length, from 2 to 3 feet deep in

mud, and I saw mules frequently in drays sunk up to their shoulders in this abominable filth.

It rained frequently during the nights, and immediately after a downpour the small arising from the disturbed surface of the saturated ground, and the numerous mud-pools, was very hard to put up with, but nevertheless it had to be borne, as we had to wait for six days to get a ship to Jamaica. *J. Harv., Jamaica.*

THE AMARYLLIS.

At p. 619 of the last volume, some remarks were made about the plants being grown on vigorously to make up for the loss sustained by the production of flowerscapes and seed-pods. They have now quite recovered; the seeds have been ripened, sown, and produced nice thrifty plants, 3 and 4 inches high. These, when three weeks old, are carefully lifted from the seed pots or pans, and are pricked out, twelve large plants in a 6 inch pot, and the same number of smaller sized in 5-inch. As soon as they are potted in a rather open and rich compost, let the pots be plunged to the rim in a bottom-heat of about 55° in a hot-house temperature. These small seedling plants require to be kept in a free growing state, very much later than the large bulbs; nor do they become dormant during the winter. No leaves are lost, and they require but little water at that time, merely enough to keep the soil from becoming stick dry. The old plants do not require very much water now, and they need more sunlight as the nights lengthen. We admit air freely now, and the plants are kept free from red-spider and thrips by being thoroughly syringed occasionally, not daily, as constant syringing would cause some of the bulbs to rot, even when they are growing freely; they would be the more liable at this season when growth is completed. *J. Don, lar.*

THE COLONIAL EXHIBITION. NO. VIII.

INDIA.—On entering the Exhibition buildings, whether from the Exhibition Road or from the subway, one cannot but be impressed with the magnitude of the display made by the Indian Empire. Though by far the largest space is occupied by art objects, the space devoted to raw products is still considerable, and it is in this—the economic section—that vegetable products abound, not alone raw products but many manufactured articles also. Though the Indian courts throughout lack that appearance of comfort and finish to be found in the West Indian and Australian courts, there is an immense amount of novelty and interest to the stay-at-home Englishman, calculated to give him an insight into Indian life and habits, and to show up the nature and variety of productions of Indian soil. To say the least, the Indian courts are bewildering from beginning to end, so numerous are the exhibits that it is a surprise how they could have been got together and displayed as they are in the time.

Amongst the most attractive exhibits in the Economic court, the Indian shops certainly claim the first notice. To the casual visitor the methods of displaying the seeds, fruits and vegetables in the circular Bamboo trays will have a certain interest, exhibiting, as they do, such a different mode of trading to that with which we are accustomed; but to one who has an interest in foreign vegetable products the contents of each tray will be more carefully scrutinised. In the first shop, namely, that of the "grain merchant," we find the merchant himself engaged in weighing a seed not unknown in this country as an article of food, namely, the Lentil (*Lens esculenta*), an annual of which, though it was cultivated by the Hebrews, and in Europe since the days of the Roman empire, the native country is not known. At the present time the Lentil is largely cultivated throughout the East, as well as in many parts of Europe, North Africa, West Asia, and North-west India. The Lentil is known under numerous varieties, indicated by the size, shape, or colour of its seeds—the small pinkish-coloured seed being the one which the grain merchant is engaged in weighing. Like Peas, Lentils are seen in trade either whole, split, or ground into a kind of flour; in this last form they enter largely into the composition of the food so much advertised as "Ervaleta" or "Revalenta," and sold as an invalid's food. Seeds also are here shown of Phaseolus mungo, known in India as Green Gram,

a plant largely cultivated under a number of varieties for food. The seeds are very small, round, and in some varieties of a bright green colour. Numerous other seeds and grains of an equally interesting character are also shown.

The stock of the "vegetable seller" consists of, amongst others, Papaw fruits (*Carica Papaya*), a tree supposed to be originally a native of the warm part of the American continent, but now widely diffused through the tropics of both hemispheres. The tree is well known for the peculiar property it possesses of causing newly killed meat to become tender in a few hours by wrapping it in the leaves or rubbing it with the juice, by causing a separation of the muscular fibres. The fruits when ripe are of a yellowish colour, of an oblong or somewhat pear shape, firm, generally about 8 or 10 inches long, with a thick fleshy rind, and numerous small black seeds. These fruits are eaten when cooked as a vegetable, or preserved in sugar. The active principle of the Papaw is known as Papaine, and has attracted much attention of late as a remedy in diphtheria, indigestion, &c.

Scattered about with other fruits, some real and some models, are the Carambola (*Averrhoa Carambola*), a tree belonging to the Geraniaceae, and closely allied to the Oxalis, or Wood Sorrel; another species, the Bilimbi (*Averrhoa Bilimbi*), being perhaps better known than the Carambola. Both have an acid taste, and the latter is often used as a pickle. The peculiar elongated warty fruits of *Momordica Charantia* are also shown. They are of a reddish or orange-red colour, and the plant, which is a climber, is distributed in India, Malay Islands, China, and Tropical Africa. The Banans (*Musa sapientum*), Bread-fruit (*Artocarpus incisa*) and Cashew Nut (*Anacardium occidentale*) will be more readily recognised, and still more so the Brinjal or Aubergine (*Solanum Melongena*) as the plant is largely cultivated not only in India but in nearly all warm countries for the sake of its egg-shaped fruits. In France, indeed, they are much esteemed and are not by any means uncommon in our own markets. The varieties however, are perhaps more numerous in India than in France, for the fruits not only vary considerably in size but also in colour, some being white, while others are yellow, violet, or even nearly black; several varieties are shown by the "vegetable seller."

The stock-in-trade of the "fruit seller" comprises many that are well known in the English trade, such for instance, as Raisins, Currants, Dates, Figs, Almonds, &c. Apricots, the fruits of *Prunus armeniaca*, are also shown, but in a dried state. These were shown and commented upon by Mr Morris, in his recent lecture on tropical fruits, and there seems no reason why they should not become an article of trade in this country, for as a dried fruit they are by means to be despised. In India the Apitcot is largely used for food both in the dried and fresh states, while from the kernels an oil is expressed which is used for burning in lamps, for culinary purposes, and for the hair. In Damascus, the stones are removed from the fruits and the pulp rolled out into thin sheets, in which form it is sold in the bazaars.

Passing on to the "druggist," who occupies the last establishment of this group, we find, besides many well-known articles which are not only used as drugs but also as condiments or spices, or for other culinary purposes with us, such as Ginger, Capsicum, &c., many that will be quite unknown except to the student of Indian pharmacy. Here, for instance, are the flowers of *Woodfordia floribunda*, better known perhaps as *Gibbera tomentosa*, a large shrub, belonging to the order Lythraceae, and closely allied to the *Henra*, common throughout India, ascending to an elevation of 5000 feet in the Himalayas, and found also in China, Tropical Africa, and Madagascar. The flowers are mostly used in India as a red dye for silks. Near these are some thin circular slices of a bright red colour, which will be soon recognised as having been cut from the more or less globular fruit of the Baël (*Egle marmelos*), the pulp of which, especially in an unripe state, is astringent, and is used in diarrhoea and dysentery, as well as for making a conserve, and in the preparation of a sherbet. The Baël is a tree found in the sub-Himalayan forests, from the Jhelam eastwards, and Central and South India and Burma. The long black cylindrical pods of the Purging Cassia, or Indian Liburnum (*Cassia fistula*), attract some attention on account of their stick-like form. The tree producing these pods grows to a height of from 30 to 50 feet, and is a native of India, Ceylon, Java,

the Philippines, Tropical and Subtropical Africa, and has become very largely planted in consequence of its ornamental character (bearing numerous racemes of bright yellow flowers) in the West Indies, Brazil, and Central America. It is, moreover, much valued as an economic tree for the sake of the pulp contained in the cylindrical pods, which are pendulous from the trees, and often grow to a length of 2 feet. The pulp has a sweetish taste, is of a lachish-brown colour, and is used as a mild laxative. It is imported from the East and West Indies, the finest quality, however, comes from the latter country, some remarkably fine pods being shown amongst the West Indian exhibits. *John R. Jackson, Curator, Museums, Royal Gardens, Kew.*

POTATO CULTURE.

SELECTION OF GROUND.—Success in Potato culture is attainable not only in different climes, but also in a very great variety of soils. Under otherwise favourable conditions, the tuber will grow as well in clear sand as in stiff clay. The happy medium is generally the best.

A thin layer of fertile surface-soil, resting upon clay subsoil, which is impervious to water, should never be used for Potatoes, not even if thoroughly underdrained. The tubers are more apt to rot in heavy, sticky soils, particularly in a wet season, than on light sandy or gravelly ones.

It is a very common practice with farmers to plant Potatoes on Clover sod, ploughed in the spring. This selection is a good one; provided, however, that, as in the case of young and rank-growing Clover, the sod is such as to admit of thorough pulverisation, or that the field can be ploughed early enough during the summer or fall previous, to give ample time for the sward to rot, and thus make cross-ploughing practicable. Otherwise, when the Clover field is old, and the roots of grasses and weeds are woven into a tough, thick sward, which cannot be easily broken and pulverised, it would be advisable to have a crop of Wheat, Rye, Oats, or corn precede the Potato crop.

An admirable selection.—For early sorts, clay loam, very rich; for late sorts, sand or gravelly loam, of medium fertility. Naturally drained, loose and mellow Clover sod, or stubble after stiff sod is the best imaginable condition or state of cultivation in either case.

MANURE AND ITS APPLICATION.—FEED THE LAND AND THE LAND WILL FEED YOU.

Coarse, unfermented stable dung is nearly worthless for the Potato crop, unless as a mulch on very porous and dry soils. Thoroughly rotted compost in moderate quantities is a good fertiliser for tall-growing varieties, while low-growing early sorts are generally benefited by more liberal applications.

The Clover on the pasture lot or meadow selected for a Potato field should not be grazed or cut very late in the fall. We could hardly wish for a better fertiliser than a good growth of Clover, covered during the fall with a coat of fine old manure or barnyard scrapings, lighter or heavier, according to variety to be planted, and, if possible, applied with a Kemp manure-spreader, or, at least, evenly and finely distributed by means of harrow or otherwise.

For stubble ground fall manuring can be recommended only on condition that the manure is harrowed and cultivated into the soil and thus left until spring.

On land manured the year previous Potatoes will do well without additional fertilising, still the application of wood ashes or lime often increase the yield. Newly applied stable manure seems to attract the wireworms, and therefore has the tendency to produce scab in the tubers. Coarse manure is a frequent cause of prongs, protractures, "fingers and toes."

Commercial fertilisers meet with no objections of this kind. The fairest, smoothest, and best shaped tubers are generally grown on well-pulverised soils which were fertilised with chemical manures, or not at all the same season. In recommending such fertilisers, we enter debatable ground. While we have never failed to see good results from the application of phosphates, &c., whenever we tried them on Potatoes or other crops, there are many cases on record, as reported by different farmers, where even complete fertilisers—those containing ammonia, phosphoric acid, and potash—utterly refused to respond. Still we believe that the fault is with the man opener than with the material. Commercial manures add

chemicals give us one great advantage. Of the three most important elements, ammonia, phosphoric acid, and potash, the soil may contain a sufficiency of one or two. If we know, from previous experiments, which these elements are, it will be only necessary to supply the one that is lacking. Thus, our own soils were always deficient in phosphoric acid, and therefore greatly benefited by its application, next by that of potash, but not noticeably by ammonia. On other soils ashes or some other forms of potash, either alone or in combination with phosphoric acid, or ammonia, will greatly increase the yield.

If previous experiments have not been made to determine the relative proportion of these elements in the soil, complete manures like Mapes' or Stockbridge (Bawker) special Potato fertiliser, Powell's Potato producer, &c., which contain the three ingredients in about the right proportion for the crop, can be relied on with safety. From 600 lb. to 800 lb. to an acre should be applied broadcast, just before planting, and deeply harrowed into the soil; or in drills, about an inch or two above the seed, and covered by a few inches of soil. The well-known experimenter, Sir J. B. Lawes, of Rothamsted, used 300 lb. of sulphate of potash (130 lb. actual potash), 350 lb. superphosphate of lime, 550 lb. of nitrate of soda, to produce a crop of 400 bushels. This means almost a mere manufacturing of the crop out of chemicals, without calling on the soil for assistance (as to the supply of raw material); and such manufacture might be carried on year after year on the same land. The cost of raw material would be about as follows:—

300 lb. of sulphate of potash, at 2½ cents ..	7.50 dol.
350 lb. of superphosphate, at 3½ cents ..	12.25 "
550 lb. of nitrate of soda, at 3 cents ..	16.50 "
Total	35.95 "

Expensive as this manuring appears to be, we could well afford it if thereby we make sure of a crop of 400 bushels.

Where unleached wood ashes are obtainable at little cost, they may take place of sulphate of potash, and perhaps show better results at less expense. The cheapest source of phosphoric acid for Potatoes, probably, is dissolved South Carolina rock, containing about 27 to 30 per cent. of bone phosphate, and costing 16 dol per ton.

Nitrate of soda is an awkward thing to handle, on account of its great solubility, and dear also. However, it has this one great advantage—that there is no need of applying it sooner than the growing vines show the lack of it. Never apply it in the fall.

A rank growth of Clover or of Clover roots (turned under) supplies all the ammonia needed, and is generally the cheapest form in which ammonia can be obtained. This manurial substance plays a very important part in giving thrift and luxuriance to the foliage, and while large tops in themselves are not our object, we can hardly hope to reap a large crop of tubers without their assistance.

The supply of ammonia, especially if scarce, should be supplemented—reinforced, as it were, by the application of Potato pulp represented in a sufficiency of seed. *Southern Planter.*

BEGONIAS AT MESSRS. SUTTON'S.

It is not without regret that one sees the race of fibrous-rooted Begonias making room generally for the more showy tuberous-rooted species. We have certainly lost in grace and perfume, if we have gained in brighter colouring and greater usefulness. Our old friends seldom seemed happy except in the height of summer away from the plant-stove; and that is just the place where visitors linger for the shortest time. The newer tuberous varieties are more hardy, due to the infusion of the Begonia Sedent blood, and can be as appropriately used in the greenhouse as out-of-doors.

The more ordinary type of these at Reading are robust, dwarf, with much shorter nodes with more of them, and with, consequently, greater floriferousness, for the tuberous Begonia blooms spring from these, and when they are far apart there are fewer flowers.

The chief aim has been hitherto to procure round, saucer-shaped flowers, with short, stout footstalks, that need no artificial support. The colours of these run through scarlet, crimson, pink, and white. In contradiction to the above are those that own B. Davisi or B. Pearcei, as one parent, in which the flowers spring

direct from the tuber, and the whole habit of the plant is dwarf, the flowers small, but making amends for that by great quantities of brilliant blooms. Some of the hybrids from B. Davisi are of varied shades of scarlet and are more free than the parent.

In a group in one of the houses was observed some hybrids, B. phosphorensis x B. Pearcei, that possessed the handsome, velvety, marbled foliage of the latter, with flowers ranging from light primrose to deep copper colour. These were in great variety, and the handsomely marked leaves greatly set off the plentiful crop of flowers. The habit of the plant was in all cases dwarf.

These ought to be acquisitions in the flower garden in suitable localities, and might be made to supply a known want, that of a good bronze or yellow leaved or vase plant, apart from the Calceolaria. B. Meteor is one of the more lustrous yellow flowers which has been honoured with a name. E. Freebell in quantity was noticed in a house by itself; it is later than most others in coming into bloom, and some curious shades of cherry-red were observed.

Of the better known leading Begonia sempervirens, there is a selection from it with pure large white flowers; it is named Reading Snowflake. It has the desirable habit of flowering from midsummer till Christmas. *M.*

Florists' Flowers.

GREENHOUSE CALCEOLARIAS.

Any old plants intended to be grown again should be in a cool place, such as a frame behind a north wall. They ought to be repotted, and the stems ought to be covered over with fine soil, to promote the emission of roots from the stems and the base of the growths. When they have formed roots they may be divided into separate plants. If seeds are not already sown, they ought to be seen to at once. A packet of the best seed is a very minute object, and a careless operator might sow the whole of them in one spot. Let the pot, or pan, in which the seeds are to be sown be prepared first. Fill it to an inch of the rim with ordinary potting mould. Some finely sifted sandy soil ought to be placed over this, and be made quite smooth by gentle pressure. Now open the packet of seeds carefully, and sow them evenly over the surface, and just cover them with clean sand. The seeds will vegetate best in the frame behind the north wall. A square of glass ought to be laid over the top to keep an equable state of moisture. After sowing, the mould ought to be kept at an even state of moisture. If it should become over-dry while the seeds are vegetating, the whole of the incipient plants would perish, and the seedsman would be unjustly blamed. Young plants ought to be pricked out as soon as possible as they are very liable to damp off in the seed-pans.

CINERARIAS.

The young seedlings ought to be pricked out this month, and those that were pricked out last month should now be placed singly into small 60's. The old plants were divided last month, the portions being potted into small pots. The seedlings and old plants are now together in frames facing the north. The lights are also shaded during the hottest part of the day. The plants have to be kept quite free from insect pests (thrips and green-fly); these and the Calceolarias are both very liable to be attacked by them.

FUCHSIAS.

We have more than one set of these plants for keeping up a display during the summer and autumn months. When the plants are potted in rich soil, and are not allowed to suffer for want of water at the roots, they continue in flower a long time; the shoots grow out and continue to produce clusters of flowers at their extremities until they become rather unsightly, when they are removed and their places supplied with young plants coming into flower, which have been in preparation in reserve pits. These young plants were propagated from cuttings in the spring; they will continue to produce flowers late in the autumn. Fuchsias, Liliums, zonal Pelargoniums, and Carnations are now the principal feature in the greenhouse and conservatory.

PELARGONIUMS.

The large-flowered and small-flowered or fancy

section again require attention for next year's bloom. The earliest flowered plants were cut down a month ago, and have now started sufficiently to be shaken out and be repotted in smaller pots than those they flowered in. This shaking out and repotting must not be delayed too long; it ought to be done as soon as all the buds have started. Some growers advise placing the plants in close frames or in a gentle bottom-heat. This is not necessary; if the operation is done in time not a leaf will flag, even if the pots are placed in an airy greenhouse. The best time to take cuttings is in May, and if this was done the plants produced from them should now be stopped if that was not done last month to ensure about four eyes starting, or perhaps five, with a clear stem underneath. If these plants are now in large 60's they may be potted into 5 inch or large 45's, using good potting soil; the four or five stems produced ought to be tied out to form the foundation for the future specimen. Such plants will form nice flowering specimens for next year. The late flowering plants have just been cut down, and they will be allowed to start out-of-doors; but will be placed under glass as soon as they are shaken out and repotted. Seeds saved now may be sown at once.

CHRYSANTHEMUMS.

The growers for exhibition are now daily amongst their plants, because it is now the time for "setting the blooms." The flower-buds are being formed, and almost as soon as quick eyes can discern them lateral growths push out from the stems immediately beneath the buds, and as soon as these are perceived they are broken off with the fingers; if this is not done the growths would push rapidly past the buds, absorb all the nourishment from them, and they would not develop into flowers, although a flower would be produced on each of the growths, but the food that should have gone to the production of one flower will be diffused amongst three or four, which will be but indifferent specimens, compared with what the one would have been that they destroyed. Greenfly will also be found sometimes, clustering round the points of the young shoots; frequent applications of tobacco powder applied with a pepper-box will destroy them; the operation is quickly performed. Clasp the growth lightly in the left hand, and with the right with one or two shakes cover the points with powder. Some persons wet the leaves first, but I apply the powder in a dry state. When the buds are all set mature-water may be applied to the roots, but not earlier. The specimen plants should be gradually trained into form. Sometimes the growths are left until the flowers are nearly open, with the result that they are tied down to make what is supposed to be a dwarf specimen, but a plant is produced which a tasteful gardener would not tolerate on the premises. The large-flowered Chrysanthemum does not naturally grow into the form of a Mushroom, why, then, should it be forced through a variety of contrivances to assume that form? Let each growth be trained out without crowding them, or having them too far apart. Good culture will consist in keeping the leaves free from mildew, and in a healthy condition to the base of the stems. *J. Douglas.*

FRUIT PROFITS.

It is pleasant to go through market-orchard districts in the spring months, and mark the wondrous colouring and beauty found in masses of bloom on the trees. The Plums and Pears white as snow; Cherries, as if literally hung with pendants of snow; Apples, covered with pink flowers, all so lovely, and all so full of promise. Earlier the Currants and Gooseberries have bloomed, but in an unostentatious fashion, and yet indicating a wealth of produce later. Strawberries in wet beds give a sheet of flower, and there is every indication that the year will be one of exceeding fruitfulness. Later, perchance, frosts, besides cutting east winds, blight, or other causes, have so far discounted the probable fruit crop, that now not more than one-half the expectations earlier formed will be fulfilled. Sometimes matters are better, but on the whole, if what is pretty well understood to be an average crop all round is finally obtained, some salace is found in the anticipation that a glutted market will be avoided, and fairly good returns result. The Strawberry crop is gathered, and it proved generally disappointing. Some were fortunate, but the great bulk of growers were less fortunate, and they are destroying their breaths:

to sow or plant something probably more profitable. Perhaps next year may give good crops generally, for in Strawberries rarely do two bad seasons follow each other. Still the grower of some 10, 20, or 30 acres of those fruits feels that he runs considerable risk should a second bad season follow; hence he is naturally reducing his Strawberry area. Bush fruits very often prove the market fruit-grower's backbone, for these rarely miss a crop, and this season they have generally well maintained their reputation; we have seen Gooseberries and Currants of kinds literally laden with produce up to the very utmost of bush power to carry it, and very fine clean and good Raspberries, too, have been fairly abundant, but canes were smaller than usual, owing to the exceeding drought of last year. However there has been little to complain of in the matter of quantity or quality, so that as far as produce was concerned, it might be said for the market grower that his prospects were rosy.

As to fruit, however plentiful and good, will neither pay wages, rent, rates, or the thousand and one other pecuniary obligations which encumber the crop of the fruit-grower. He must convert his paths into cash in the markets, and with that pay his way; well, he has to get this product to market, and if he resides within moderate reach of the metropolis, no arrangement is better than loading his own vans overnight, sending them to market, and returning them laden with manure. If he attends market himself, whilst subject to all the labour and discomfort as well as expense which such duty involves, at least he knows that he gets all the cash he takes, whether prices be good or bad, and has also the advantage of gauging the tone of the market—knowledge often helpful in preparing his next consignment. Perhaps he puts down the bulk of his goods at shops, a capital arrangement, because the middle-man is dealt with at his own home, and the goods neither pass over nor require farther transit. That sort of trade is, however, chiefly done by the smaller growers, most of whom have regular customers. Still this trade is regulated by current market prices, and the shopkeeper will pay no more at his door than he would have to pay in the market. The most awkwardly placed grower is the one who lives remote, perhaps 40, 50, or more miles, from London, as for instance, many of the Kentish growers do, and who not only have to consign their fruit to London per rail and sell through a salesman, but also must get their manure back per rail.

It need hardly be said that if we take bush fruits, for instance, it is obvious that the cost of marketing is very considerable, especially where transit is over so long a distance. Possibly the grower pays from 4*z.* to 6*z.* per half bushel for gathering into his own baskets, previously purchased. Each basket must be carefully papered and, perhaps, strawed or grassed over, or, to use the ordinary phraseology, "packed," then loaded in a van, sent possibly some 3 or 4 miles to the railway station, loaded into trucks, carried to London, reloaded into vans, and taken into market, put down at salesmen's stands, and then sold for what the fruit will fetch. Fancy, therefore, the dismay of the grower when he finds that a good sample of Gooseberries, for instance, goes for 1*s.* 3*d.* per half-bushel, of which sum the salesman secures 3*d.* for commission, and the unfortunate grower gets back the remaining shilling to cover all expenses enumerated, as well as rent, labour, rates, tithes, and other costs; and this is a true picture of what has been going on of late. Even near home the grower, putting his fruit down at the shopkeeper's door, has obtained in return but 1*s.* 6*z.* per half-bushel for Gooseberries, and about 2*s.* per half-bushel for Currants. Raspberries gathered into punnets, all of which, of course, have to be paid for, have sold at 3*z.* per pound, out of which, besides the cost of punnets, something has to be paid for gathering and the getting to market. Cherries sold very well, but these were but a partial crop, and sweet kinds (one of the most uncertain crops) will do well only in certain localities. Morellos are far better average croppers, but are not so widely grown as they merit; as it is, they do but obtain a fairly remunerative price.

Apples will certainly sell well, and happily may be held a week or two to suit the market. Pears are less accommodating, and must be run in as fast as ready. Generally there are good crops of these, but they are needing moisture to promote swelling. Still it is expected that they will be presently literally dirt-cheap, because of the bulk; and as for Plums, if the jam-

makers do not purchase largely, they will be a drug, for they must or rot on the trees. All these dire results, as far as indifferent prices are concerned, are largely irrespective of foreign competition. We have planted so largely of hardy fruits that when a good crop follows it is impossible to find for it a really profitable market. A half crop, it may be, gives the best prices, but after all half crops satisfy no one. Still further, when we get full crops we have no option but to accept them with all risks. There are still those who think that the home demand for fruit is almost unlimited—that is an obvious error. It may be a matter for surprise, having regard to the immense numbers of our population who are cut off from garden pleasures and pursuits, that it would be impossible to satisfy their cravings for fruit; but such seasons as the present show that even with the enormous demand created by the preservers yet fruit of home growth is a drug, and it is not probable that foreign fruit can be otherwise. How to make average fruit farming profitable is a great problem, which invites solution. A. D.

XANTHOCERAS SORBIFOLIA.

We have, as usual, this year some fruits of *Xanthoceras sorbifolia*, but the fruits are perhaps a little finer. It is a fine plant, which is covered with flowers in spring. The trees, left to themselves, have taken a roundish and elegant form. The fruits are few; they are a little too heavy for the branches. The seedlings grow very well. This spring we had ten seedlings, which flowered the second year when only 40 to 50 centimetres high. *Maxime Cornu, Jardin des Plantes, Paris*. [Our illustration (fig. 42) shows the fruit as we received it from Professor Cornu. It is very like in its leathery texture that of the Horse Chestnut (*E. Esculus*), and as it dies it splits into three valves in the same manner. Ed.]

— This is a white-flowered shrub of great beauty. The flowers, which appear in pendulous racemes, are of the size and shape of those of the well known Forsythia; the colour is pure white; foliage pinnate, light green, very fine. For the first time I saw this beautiful shrub in 1880, in the Jardin du Luxembourg, in Paris, and was quite surprised by its beauty. The propagation is said to be rather difficult, and this may be the reason that the shrub is not planted so often as it ought to be. I tried root-cuttings this year, putting them in February in a pot, and plunging the pot in a cold frame and was successful in obtaining a good number of young plants. This shrub is not quite hardy here, but is so in England. C. W., Cassel.

The Rosery.

ROSES IN POTS.

OURS have been reported for some time, and have been placed in a good open position out-of-doors. All that they require is to be kept right as regards water at the roots, and the leaves free from red-spider and aphid. Mildew is also very troublesome; it seldom fails to appear at this time, but it may easily be destroyed by attacking it at its first appearance with flowers of sulphur. The Tea Roses in pots will soon be making their second bloom, which will promptly succeed the first bloom out-of-doors; indeed, our Tea Roses are yet in great beauty on a raised bed out-of-doors. If we had room under glass I would keep the Tea Roses in a light airy greenhouse all the year round; and if it was heated during the winter, Roses would be plentiful "from November to October." When the plants are under glass, there is no difficulty whatever in keeping them perfectly clean. The leaves should be glossy and bright, like a glint of sunshine. Now is a good time to repot any plants requiring it, and as good potting is the foundation of successful culture may I urge the importance of every rosarian giving minute personal attention to this? Let the pots be quite clean, the drainage clean and carefully placed (not thrown in anyhow). Some tough fibre should be placed over the drainage to prevent the loose compost from mixing with it. For Tea Roses use loam three parts, turfy peat one part, decayed manure one part, with a little bone-dust, coarse sand and pounded charcoal. For other Roses use leaf-mould instead of peat; the same compost will do for the Teas if peat cannot be obtained. Jas. Douglas.

THE ARNOLD ARBORETUM.

AFTER a delightful drive through the pleasant avenues of Jamaica Plain we found ourselves at the Arboretum of Harvard College, which contains 165 acres of land quite varied in character. This is a portion of the well known Bussey Farm, in that part of Boston formerly known as West Roxbury, and is within a few minutes' walk of the Forest Hills station, on the Boston and Providence Railroad, making it of easy access to visitors. The location is such that the experiments here made will be of great value to New England, and of general interest to a large portion of the whole country. The Arboretum is yet in its infancy, having been commenced only in 1874, when the seeds of the first trees were planted, so that, excepting the older trees previously on the place, of which there are many, a great portion are only nursery plants, which, on account of certain arrangements made with the city of Boston, could not be planted in permanent positions until the laying out of some of the roadways had been completed. This being accomplished in part, the coming spring will see many of the botanical orders planted where they are to remain permanently, the planting being as far as possible in botanical sequence. Along the roadways will be planted both native species and those of foreign introduction, including all the varieties, so that even one not possessing special botanical knowledge can at a glance comprehend the arrangement and see by comparison the plants which best endure our climate. The Arboretum will thus be a living museum, where the nurseryman, gardener, and private landowner may come for trustworthy information regarding all trees or shrubs, which will save them the cost of personal experiments and of delays caused by unfortunate selection.

The collection of living plants at the Arboretum is richer in species than any other in the United States, numbering at the present time over 2000 species and varieties of woody plants. Many of these may prove failures, but it is the work of the Arboretum to show by living illustrations what to select and what to avoid. The collection is being continually increased by a system of exchanges with botanic gardens and similar institutions, both public and private, in every part of the world within the temperate zone. Experiments are also being made with seeds of plants taken from widely different localities, with the hope that additions may be made to our lists of hardy trees. This has already been done in several instances, such as *Abies concolor*, *Pseudo-Tsuga Douglasii*, and several others, the seeds of those plants brought from the warmer parts of the Pacific coast having proved of little use to us in our changeable climate, while seeds from plants of the same species growing in Colorado, under conditions similar to those in New England, have produced plants which, so far, stand our climate as well as our native trees.

Besides planting the living specimens there has been established a herbarium, containing an abundance of specimens of woody plants, collected from various parts of the world, and plants of the same species from different localities, to aid students and others in determining the names of species and the effect of climate and location. There will also be a large collection of all kinds of woods, barks, cones, and other tree productions that may be of use in the arts or sciences. These collections are already very rich in American species, and require a great number of botanical cases to preserve them. They are at present stored in a house owned by Professor Sargent, kindly loaned by him for this purpose until such time as a proper building shall be erected on the Arboretum grounds.

The sources whence seeds are received from time to time are recorded in a set of books kept for the purpose. They are numbered in regular order, and by a systematic arrangement notes are made as to their hardness, adaptability, usefulness, &c., which in future will be of great benefit in determining the history of these plants, and will form likewise a history of the Arboretum.

The past season a shrub garden has been made, comprising about 2½ acres, laid out in beds 10 feet wide by 275 feet long, sufficient in extent for 1157 species and 357 varieties. The shrubs are systematically arranged, beginning with the order Ranunculaceæ and ending with Smilacaceæ, and not only botanically, but, as far as possible, geographically, American plants coming first. Here any one with even a limited knowledge of plants can take notes of these

growing specimens, which will enable him to gain more knowledge than months or even years of study from books or catalogues could give, and will help him to make such selections as he would like to plant. All this is done at the expense of the Arboretum, thus giving all who wish to avail themselves of its privileges and advantages a real school of instruction free of all cost, and this will go on from generation to generation. No other such place is known where such valuable information can be similarly obtained, while Mr. Dawson, the skillful gardener, is always ready to impart any knowledge in his possession.

There are spaces left open for undetermined varieties, but the garden now contains 690 species and 250 varieties, with the possibility that from 400 to 600 new species or varieties will be added the coming year. This location was mowing land, and was broken up only a year ago, and it is really astonishing to note what has been accomplished in so short a time; we can look upon this branch of the Arboretum work as one of the noblest educational agencies existing in any country.

freely opening its collections to the public, and by securing for it additional and greatly needed land, suitable and dignified approaches, and carriage drives.

The objects of the Arboretum may be definitely stated in a few brief words that all can understand. First, a school of arboriculture for the study of trees and shrubs and their uses for timber for ornament and otherwise. Second, a museum of living specimens of all ligneous plants that will stand the climate at West Roxbury, planted and arranged in botanical order. Third, a museum for reference, containing a dried collection of all ligneous plants, properly labelled with the time of flowering, native location, and, if foreign, the country where they are indigenous; also a full collection of specimen wood, bark, fruit, seeds, &c. Fourth, a library containing all the best works on dendrology, for the use of students or others interested in the science of tree culture.

In closing this somewhat lengthy yet inadequate account of our visit to the Arboretum we must not omit to say that its success is due to the untiring and indefatigable labours of the director, Professor Charles S. Sargent, whose large correspondence and thorough

almost uniformly of a warm rosy-purple, with a faint tinge of violet, and marked transversely near the base of the sepals and petals with bands of a lighter colour. In the form flowering in the pits at present these colours are intensified, especially on the contiguous sides of the sepals and the labellum. The colours are deepest immediately after expansion, contrary to that of some others which gain in colour after being exposed for some time to the light. This richness in colour adds greatly to the value of an already popular species whose strong but agreeable odour pervades the atmosphere of the house in which it is grown. The odour may be described as that of some preparation from Apples, is strong enough to be appreciable at some distance, and is not disagreeable when intensified by proximity, like that of many other Orchids whose fragrance is sweetest and most enjoyable at a short distance. J. F.

DENDROBIUM PARISHII VAR. DIVES.

This is a very interesting, surprising and lovely novelty. The stem at hand is nearly 2 feet long, with thirty-two flowers open at once, so that it is nearly covered by them. They are smaller, and the lip is more transverse, and yet more acute, and with larger eye-blotches than are found in the well-known type. It has the usual smell of *Rhubarb*. It was kindly sent me by Mr. W. Bull. *H. G. Rehb. f.*

MILTONIA SPECTABILIS, VAR. MORELIANA.

Generally regarded as a true species this handsome *Miltonia* is inseparable in structural points from *M. spectabilis*, of which, however, it is a very distinct form, and superior in every respect to the type. Like most of its congeners, however, its scanty foliage generally presents a sallow aspect, the tone of which is greatly augmented by the deeper yellow shining pseudobulbs. This fault is more than compensated for by the large, conspicuous, and generally showy flowers, in this case solitary. In the type the sepals and petals are white, while, singularly enough, these parts in the variety under notice are the darkest, being a deep violet-purple, somewhat paler or whitish at the base. The flat spreading labellum is broadly obovate, tapering to a short wedge-shaped base, and is pale purple upwards, deeper coloured on the lower half, and somewhat variegated about the small three-toothed crest. There is a figure of this form in the *Botanical Magazine* under the name of *M. spectabilis* var. *purpureo-vioacea*, and another in Jennings' *Orchids*, 37. A flowering specimen may be seen in the cool division of the Orchid-house at Kew, where it is conspicuous amongst other things by its size and depth of colouring. The *Cattleya*-house would be the most appropriate for it when flowering, and also when at rest, but when making its growth it should be placed in a temperature resembling that of the East Indian house. This species may be grown on a raft well mossed over with sphagnum, or in a basket amongst good fibrous peat and chopped sphagnum, kept porous by lumps of charcoal, with good drainage and plenty of water, especially during the growing season. J. F.

EPIDENDRUM FAYTENSE.

From Sir Charles Strickland we have received a seed-pod of this species. It is when ripe about three-quarters of an inch long, globular in form, the three valves being united below and at the top, but separate elsewhere, and surmounted by the remains of the column, which forms a beak nearly as long as the fruit itself.

RIPENING AND PRESERVING FRUIT.

The following are the principal passages of a lecture delivered by Hon. Marshall P. Wilder, at a recent meeting of the Massachusetts Horticultural Society, Boston, U.S.A. :—

The principles upon which success must ever depend are now so well established that it is only necessary to bring them to mind for our government. The preservation of Apples through the winter months is now pretty well understood, but with the Pear, Grape, and other delicate fruits more care is requisite.

The ripening of fruit depends on saccharine fermentation; this is followed by the vinous and acetous fermentations. To prevent these, and preserve fruit in all its beauty, freshness, and flavour, the tempera-

There is a small span-roofed greenhouse devoted mainly to propagating trees and shrubs in winter, by grafting, cuttings, and seeds—from 10,000 to 15,000 are produced annually. In spring they are placed thickly in boxes, and as soon as established are allowed to harden off in the frame ground. In this ground are several deep pits where the plants are stored for the first winter—every available place is used, and a look into one of the pits a few days ago revealed a surprising quantity of young plants which will take their places in the nursery rows another season.

In 1875 there were 128 species raised. In 1877 Mr. Sargent wrote that, judging from the immense number of letters which were annually sent him, there was a steadily increasing interest felt in the Arboretum. It was then but five years since its establishment, but its usefulness and influence were already evident, and to its influence could be traced the planting during that year of nearly half a million trees in the New England States.

In December, 1882, an arrangement was made with the Park Commissioners of the city of Boston, which, without interfering with the scientific aims of the Arboretum, will increase its local influence by

knowledge of all that pertains to the duties of his offices have already given to the horticultural world one of the grandest educational institutions this generation has been blessed with. *Boston Paper.*

Orchid Notes and gleanings.

PHALENOPSIS VIOLACEA.

ALL the forms of this species which have flowered at Kew for some years back are vastly superior to the type as figured in the *Orchid Album*, 182, or the *Floral Magazine*, n.s., 342, where the flowers are of a pale yellow, almost primrose, tinged with green, except the contiguous sides of the lateral sepals and the terminal lobe of the labellum, which are rich rosy-purple. A figure is also given in the *Gardeners' Chronicle*, 1881, xvi., 145, f. 32, where the sepals and petals are described as rich rosy-purple and pale green upwards. Those that have flowered for some years previously at Kew exhibit flowers that are

FIG. 42.—FRUIT OF NANTHOECERAS SORBIFOLIA. (SEE P. 204.)

ture must be uniform, and kept below the degree at which the fermentation or ripening process commences. Mr. Robert Manning, in a prize essay, said:—"The ripening of fruit is the completion of the chemical process by which starch is transformed into sugar, and is the first step toward fermentation or decay; therefore, whatever promotes fermentation will hasten the ripening; whatever retards fermentation will tend to its preservation."

Late fruits may remain on the trees until severe frosts are feared, but should be gathered with great care. Summer Pears should be picked some days before the ripening process commences. A summer Pear ripened upon the tree is generally inferior. In respect to the latter, Mr. Patrick Barry has so aptly expressed my own opinion that I use his language:—"The process of ripening on the tree, which is the natural one, seems to act upon the fruit for the benefit of the seed, as it tends to the formation of woody fibre and farina. When the fruit is removed from the tree at the commencement of ripening, and placed in a still atmosphere, the natural process seems to be counteracted, and sugar and juice are elaborated instead of fibre and farina." Thus, Pears which become mealy, and rot at the core, if left on the tree to ripen, are juicy, melting, and delicious when ripened in the house.

With the increase of fruits their preservation in the most perfect condition has become a matter of great importance; various methods have been adopted, both in this and other countries, for this purpose, many of which have been failures. Nearly half a century ago the first houses of which I have any knowledge were built for the preservation of fruits by the retardation of their ripening. Most of these have been controlled by ice; others by the use of chemicals and apparatus with revolving fans to diffuse the cool air through the various rooms.

About twenty years ago several patents were secured for the preservation and long keeping of fruits and other commodities by Messrs. Shaler, Nye, and Smith. Professor Nye, of Ohio, had one of his houses built in Boston, to be controlled by ice, and many constructed upon his plan are still in use in our large cities and large towns for the preservation of meats as well as fruits.

Mr. Hellings, of Pennsylvania, also, in 1868, informs us of the method he pursued in building a house for the preservation of fruit, which proved very successful. This was regulated by ice; he used no chemicals or machinery—the temperature of which house he was enabled to keep at from 34 to 36°—the atmosphere so cool and dry that no moisture was deposited on the walls, and there was no dripping from the ceiling. The most constant care was also given to ventilation, and the light was entirely excluded to prevent ripening and shrivelling. With these arrangements so perfected no gases or mixture of gases with atmospheric air were ever generated. His fruit, when brought out in its freshness, retained its primitive appearance for a longer time than that we usually have from modern storehouses, and in these houses he kept Apples two or three years in perfect condition. His houses are still in successful operation at Bristol, Pa.

But the most common method for small establishments and private use is the construction of houses with walls of non-conducting materials and with well drained and thoroughly cemented cellars. Such was the one built by M. Victor Paquet, of Paris, about forty years ago—without the use of ice or chemicals—an account of which was given in the illustrated *Transactions* of this society in 1847. The house was built with outer and inner walls, with a space of 3 feet between; in fact, a house within a house, and so arranged that he could control the temperature at will, and which he kept at a little below 40° Fahrenheit. Our climate differs so much from that of Paris that we cannot follow all of M. Paquet's plans. Suffice it to say that by this process, without the use of ice, he kept his fruits in perfect condition until June.

On this plan fruit-houses may be constructed at a very moderate expense, in which fruits may be kept in all their beauty, freshness and flavour through the entire season. The Anjou Pear has been exhibited in our society as late as the month of May, by the late Gardner Brewer, from his retarding-house.

Mr. Charles F. Curtis, one of the fruit merchants of this city, informs me that there is no perceptible difference between a cold storage-house controlled by chemicals and one where ice is used. Each has its advocates.

One great secret of success begins in the state in which the fruit goes to the cooler. It should be before any sound specimen begins to show ripeness, and no single fruit should be stored that has fallen to the ground; for, however perfect it may seem, sooner or later that dropped fruit will tell its own story, and often cause the decay of the whole package when not noticed in time, which rarely happens when hundreds of bushels are piled one above another for a month or two. The fruits intended for cold storage houses should go directly from the orchard.

The cause of so many failures in storing Pears, for instance, is that the fruit is often bought of different parties, much of it so imperfectly packed that it is never fit to go to the cooler—perhaps it has been gathered weeks previous, or carried long distances, and become more or less bruised, and rendered every way unfit for keeping in this way. The past fall hundreds of bushels of Bartlett's (Williams' Bon Chrétien) Pears that were nearly ripe were stored by small fruit vendors who knew nothing about the subject.

The fruit-house of Ellwanger & Barry, at Rochester, N.Y., is a building where walls and floor are lined with straw and boards, with cellars underneath for storing fruit. When the mercury goes 10° or 12° below zero, a few, 3' or 4', of frost gets in, but the boxes and barrels are all covered with straw mats and are never reached by the frost.

When the late fall and winter Pears are gathered, they are put in bushel or half-bushel boxes and placed on the north side of a building outside of the fruit house and protected. They are kept there as long as the weather will permit—by that time the room has got thoroughly cooled and ready to receive the fruit. They have both Pears and Apples there now in perfection.

In the report of the Michigan Horticultural Society for 1882 is an account, by Mr. S. W. Door, of a fruit-house constructed by him, on the cold air system, without the use of ice. He lays down the principle, that in order to keep fruit for any great length of time, the storeroom must be frost-proof and kept at a low, even temperature—3° or 4° above freezing, with sufficient ventilation to carry off all moisture and impurities. He was able to keep his house within 3° of freezing for five months, and when the temperature outside changed 60° in twenty-four hours, the change in the fruit room was imperceptible. Again, when the thermometer fell to from 6° to 20° below zero, for five days in succession, the temperature severely changed 1° in the fruit-house. This result was effected by building a house with triple walls, 15 inches in thickness, 10 inches of which was filled with sawdust.

The conditions of success may be briefly stated as follows: The perfect control of temperature, light and moisture. All experience shows that these conditions must be complied with or success cannot be attained; hence these apartments must be cool, and constructed so as to exclude at pleasure the external atmosphere, which starts fermentation. After many years of experience, both with and without ice, I have adopted a house built in a cool, shady aspect, with the door on the north, and with a thoroughly drained and cemented cellar, with small, double windows, which may be opened or closed at pleasure. In this way I am enabled to keep my late fall and winter Pears until February or March in good condition. Apples may be kept at a lower temperature than Pears—say 34° to 40°.

In a fruit-room of this kind, Mr. John J. Thomas writes me, that by admitting air on cold nights, and closing the entrances when the air is warm, he has had sound Lawrence Pears in March, and Josephine de Malines in April, and Baldwin Apples in June.

My late fall and winter fruits, intended for long keeping, are allowed to remain on the trees until frost is apprehended. They are then gathered with great care, into bushel boxes, and placed on the north side of my fruit-house in tiers of boxes six or seven feet high, and covered with boards, where they are kept until the ground begins to freeze. They are then removed to the cellar, piled up in the same manner, with thin strips of boards or shingles between the boxes, until wanted for use, when the boxes are looked over and the most mature are from time to time taken out. In this way I keep Pears until March or April in perfect condition.

In regard to the use of ice, I would say that where fruits are kept for some months under its influence at a low temperature they seem to lose much of their flavour; the cellular tissue also seems to have become dry, and to have lost its vitality or power to resume

the ripening process. Experience proves that, for the common varieties of the Pear, about 40° of Fahrenheit is the temperature best suited to hold this process in equilibrium. The proper maturing of fruit thus preserved demands skill and science. Different varieties require different degrees of moisture and heat, according to the firmness of the skin and the texture of the flesh. Thus some varieties of the Pear will ripen at a low temperature and in a comparatively dry atmosphere, while others are improved by a warm and humid air. Some varieties of the Pear ripening with difficulty, and formerly esteemed only second-rate, are now pronounced of excellent quality because the art of maturing them is better understood. Great improvement has been made in the handling, packing, and preservation of fruits, so that they are delivered in perfect condition from distant places, every class of fruit having its suitable style of package. So well is the art of keeping Grapes now understood that we have them in our markets in such fine order as to command from 15 to 20 cents per pound until the month of May.

The Flower Garden.

GENERAL WORK.

THE flower garden may now be said to be at its best for the present season. The rapid shortening of the days and the heavy dew will very speedily show themselves on such subjects as Pelargoniums, Verbenas, Lobelias, Ageratums, &c. Several frosts keep off, carpet-beds will maintain their features for a considerable time. The past dry season has been favourable to the colouring of Alternantheras, but on the whole it has been very disappointing. Frequent picking off of all decayed flowers and leaves as soon as possible will be necessary to maintain a tidy appearance. The mowing-machine, the roller, the edging-shears and broom must be kept in constant employment. In many localities falling leaves add greatly to the labour, and ought to be swept up daily, else they give the place a lighly appearance.

PROPAGATION.

The propagation of the various plants used in the flower garden should be pushed forward as rapidly as possible, in order that they may be well established before the autumn rains arrive. Cuttings of Phloxes and Pentstemons may now be put into a cold frame or turf pit. Pink and Carnation cuttings may still be put in, but the sooner this is done now, the better. The sowing of hardy annuals, to stand the winter for spring flowering, may now be done. These are best sown thickly on rather poor soil in some sheltered but not shaded corner. They can be protected with a few boughs during severe frosts, and transplanted in early spring. Such subjects as Saponaria, Collinsia, Silene, Candytufts, Nemophila, Erysimum, Lupinus, &c., will succeed under this treatment.

BEDS AND BORDERS.

Dahlia and Hollyhocks should have the old blooms picked off immediately the flowers begin to fade. Beds of seedling Hollyhocks should be gone over, and all worthless varieties should be noted to be discarded. See that Dahlias, Hollyhocks, standard Roses, and all tall growers are kept securely fastened to their stakes. Auriculas may have their offsets taken off now if this be not already done. The better sorts may be potted into 60-pots, and wintered in a cold frame; they can be planted out in spring, or grown on in larger pots. The more common varieties may be planted in some shady border. These will require attention with water until they have established themselves, then they can be transferred to the herbaceous border or rockery at any time.

TRANSPLANTATION.

Should showery weather intervene advantage may be taken of it to transplant evergreen trees and shrubs. Such as were prepared as recommended in a previous Calendar will now be in proper condition. They will be furnished with a host of small fibrous roots in the light compost, and will scarcely feel any check from removal. Make the pits 18 inches or 2 feet larger than the ball all round, pick up the bottom a foot or

more to secure sufficient drainage, and should the soil be poor a few barrowloads of prepared compost should be placed in contact with the roots. Newly planted subjects are better without water at the roots. If the soil is sufficiently moist at the time of planting, and the atmosphere at the point of saturation, a good dewing with the syringe or garden engine once or twice a day will be sufficient, as a medium state of moisture at the root is more conducive to root action. *W. M. Bailie, Luton Hoop Gardens.*

PLANTS AND THEIR CULTURE.

INDIAN AZALEAS.

THESE plants should now be looked over, selecting the earliest flowering varieties, and those that are the best set with flower-buds, for early forcing, placing in an unheated pit, giving abundance of air, so as to get them into a state of rest before starting them again.

All plants that were late in blooming and were reported must have constant attention as regards syringing, watering, &c., to stimulate their growth as much as possible; fumigate if thrips should show themselves; turn the plants round at least once a week to get the growth and foliage evenly balanced. Discontinue shading altogether if the young growths are well matured.

THE WARM FERNERY.

The chief work in this will be to keep them well supplied with water at the roots and maintaining a humid atmosphere, for if this be neglected it will tend to give a footing to spider and thrips. Look to the regulating of fronds near the glass or where plants are at all crowded; still make up fresh pots and pans of the green and close varieties of *Salaginella*, such as *S. densa*, *S. denticulata*, *S. Martini*, &c.; peg down the rhizomes of creeping kinds; and all the young plants of *Gleichenias* that are wanted to make specimens as soon as possible may be shifted on and kept in full growth till late in the autumn. Filmy Ferns that are maturing their fronds may be less shaded, at the same time giving plenty of water at the roots, as well as on all the surroundings. *A. Evans, Lythe Hill, Haslemere.*

FRUITS UNDER GLASS.

YOUNG VINES.

THESE, if planted and subsequently treated as recommended at p. 12 of the present volume, should have made satisfactory progress during the interval, and in order to maintain a rapid and at the same time sturdy growth to the end of the growing season, a genial atmospheric temperature of from 65° to 66° at night, and 5° higher by day with fire-heat, should be aimed at, and from 85° to 86° with sun-heat and a free ventilation, allowing the temperature to rise to 90° at closing time.

WATERING AND VENTILATION.

Give copious supplies of clear water to the roots every eight or ten days, following with a few tubfuls of liquid manure to the border. Syringe the Vines and house morning and afternoon, and damp the pathways, &c., as may be requisite in bright sunny weather. Ventilate freely between the hours of admitting fresh air in the morning (after that which should be put on late in the evening had been taken off for an hour when damping the Vines, &c., at 6 A.M.), and taking it off in the afternoon, so as to secure a short-jointed and consolidated growth, without which the best results cannot be expected from Vines, or any other kind of fruit tree, whether it be grown under glass or in the open.

PEACHES.

Trees from which the crop is gathered must have plenty of air admitted to them day and night during favourable weather, so as to get the wood well ripened, and they should be well syringed with clear water morning and afternoon during bright sunny weather, so as to clear the leaves of any red-spider present, otherwise the trees will shed their leaves prematurely and before they have performed their

proper functions, thereby being injurious to the next year's crop. Bearing this in mind, give liberal supplies of clear water at the roots, but these need not be given so frequently as when the trees were swelling their crops.

LATE HOUSES.

I find it is a good plan in applying fertilisers in a liquid state to the roots of trees swelling their fruit to change it occasionally from ordinary liquid manure to guano-water. We ourselves use Eesson's manure at the rate of 9 lb. to 36 gallons of water, and sometimes we simply draw back the surface-dressing of shod dung, strew a little of the patent manure over the surface, keeping it a few inches from the stems of the trees, and then replace the mulch before giving water at the roots. By this latter method of application I consider the surface roots, which are the chief feeders of the trees, derive more benefit than they do when the nourishment is given in a liquid state. These alternate waterings of liquid manure (the drainage from manure heaps and guano-water as indicated above produce, I think, beneficial effects on the trees, and they consequently bear heavy crops that are very highly coloured. *H. W. Wood, Longford Castle.*

HARDY FRUIT GARDEN.

FIG TREES.

IF the fruit is to ripen satisfactorily, crowding the shoots must be avoided. Where there exists a crop of fruit to repay the trouble the trees should receive a good syringing as soon as the sun shines on them in the morning. It is not advisable to water the roots of outdoor Fig trees much, but on dry borders, with good drainage under them, a good watering may be applied with very beneficial results just when the fruits commence making the final swelling. In this garden the crops are looking well, and the trees promise to yield fine fruit.

EARLY APPLES AND PEARS.

Early varieties of dessert Apples, such as Irish Peach, Red Astrachan, and Early Red Margaret, are best when gathered and eaten direct from the trees as long as that is possible, as they are not adapted for keeping many days in the fruit-room. Devonshire Quince should not be left to get over ripe before it is gathered and placed on the fruit-room shelves, where it will keep sound and good for some time. Williams' Bon Chrétien Pear, in well arranged fruit gardens, will be found growing in several aspects, and by commencing to gather from the earliest a supply for the dessert of this excellent Pear may be assured for a long time by placing a few dozens in the fruit-room every week, and not making the final gathering until the last moment. When picking early culinary Apples a few should be gathered from every part of the trees, in order to allow the remainder of the crop to grow to their full size. In this part of Hampshire Lord Suffield, Cellini, and Stirling Castle are the best croppers, and often crop well when other varieties fail. Cellini is an Apple which requires using from the trees, as it soon decays after being stored in ordinary fruit-rooms.

GENERAL WORK.

To lengthen the supply of Apricots, if the trees are all on one aspect, a few dozens may be exposed to the sun, others kept well shaded by the foliage. Should woodlice attack the fruit—a somewhat common occurrence—the branches bearing the fruit should be pegged out from the wall a little, by the aid of forked sticks. The fruit should be kept in the fruit-room after gathering for several days, in order to allow the base of the fruits to ripen up well before sending them in for dessert. During hot weather the exposed part often becomes over-ripe before the base is ripe enough; for this reason it is best to let them finish in the fruit-room. The fruit of Morello Cherries to be used for bottling purposes should not be allowed to hang too long on the trees. Just as the fruit is changing from the light to the dark colour, and before they have reached the darkest shade of colouring, is the proper time for bottling them, using the earliest fruit first for this purpose, and keeping the late ones hanging as long as possible for tarts. Outdoor Peach and Nectarine trees bearing fruit, now rapidly making their final swelling, should receive a last watering for the season, adding extra mulching if

necessary. Planters of Plum trees for the coming season will do well to choose a tree or two (standards or bush-shaped) of Rivers' Early Proflic. The fruit of this variety on bush-shaped trees here is now ripe (August 9), and it well deserves the name of a prolific variety. *G. H. Richards, Somerley, Ringwood.*

The Kitchen Garden.

SEEDS TO SOW.

Cabbage.—The principal and main sowing should now be made to follow the earlier and smaller one made last month. Plants from this sowing will furnish the supply of Cabbage for next spring and summer use, and the sorts should include not only good early ones, such as Ellan's Early, Wheeler's Imperial, but also good successional varieties, as Enfield Market, Early and Large York, &c., and Red Dutch. Sown broadcast on raised beds 4 feet wide they are easily hooped over and netted. To ensure a good seed-bed the ground, after being forked over and made fine, should be formed into beds with alleys between, and if dry should be well watered before sowing the seed, and afterwards kept moist until they germinate. Too thickly placed and weakly plants should be drawn out and discarded, and the largest and most forward when really pricked out into beds and prepared for final planting out.

Cauliflower.—Sow Early London, Walcheren, and Veitch's Autumn Giant, from the 20th to the 30th of the month on raised beds in the same manner and under the same conditions as advised for Cabbage. The most forward plants of Early London from these sowings will be available for pricking out into hand-glasses and frames to furnish the first early Cauliflower next spring.

Onions.—The main sowing of Giant Rocca and other varieties sown in autumn to stand through the winter should now be made in drills 15 inches apart. Good rich firm ground that has been well manured for a previous crop will be best. A good top-dressing of soot should be applied to the surface before raking it down and drawing the drills.

Lettuces.—Make liberal sowings of the Cabbage varieties broadcast on raised beds to stand the winter. These, if afforded slight protection in very severe weather, will come into use in a young state for salads long before spring-sown ones. The young plants should be thinned sufficiently to clear one another, and to become hardy and robust before winter.

French Beans.—In view of prolonging the supply of these as long as possible throughout the season, when they are most appreciated, namely, whilst venison is in season, seeds should be sown in 7 and 8-inch pots—allowing for five to six plants in a pot, and also for earthing-up, and afterwards stood out-of-doors, to germinate and make their growth and become established, removing them into frames or heated pits, according to the state of the weather, and other conditions.

GENERAL WORK.

Continue to earth-up Celery, removing previously all small decayed leaves, and suckers, and be careful to ascertain that the plants and the soil at the roots are in a thoroughly moist condition before more is added. Earthing-up should be proceeded with at regular intervals, and according to the progress of the plants, and not much soil be added at any one time. The foliage and soil should also be in a dry condition at the time, and the latter prevented from entering the centres of the plants. Lift and store Potatoes as they become fit, and make the last sowings of Turnips on the vacated soil. Thin out advancing crops and keep the ground between them well stirred with the hoe—also between all kinds of Kale, &c., before earthing-up. Make good provision for salads by planting out on warm borders good break-beds of Batavian curled Lettuce, Lettuces, and a liberal sowing of Radishes to pull from during the autumn months. *John Austen, Witley Court.*

THUJA GIGANTEA.—In one of the Canadian courts at the Colonial Exhibition may be seen a portion of the bole of this Arbor-vitæ (often called *Thuja Lobli*), and taken from a tree circling 21 feet, and having a height of 250 feet. The specimen is from British Columbia. Jerry builders who plant this tree in suburban forecourts should take note!

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, Aug. 16	First Special Trade Sale of Dutch Bulbs, at Protheroe & Morris' Rooms.
TUESDAY, Aug. 17	Calne Horticultural Society's Show (Shropshire Horticultural Society's Summer Show) (two days).
WEDNESDAY, Aug. 18	Sale of Bulbs in great variety, from Holland, at Stevens' Rooms. Basingstoke Horticultural Show. Maidenhead Horticultural Show.
THURSDAY, Aug. 19	Sale of Imported and Established Orchids, at Stevens' Rooms. Special Trade Sale of Dutch Bulbs, at Protheroe & Morris' Rooms. Show of Table Decorations, &c., at the Royal Aquarium, Westminster (two days).
FRIDAY, Aug. 20	Chelsea Floral Society's Show (two days). Sale of Imported Orchids, at Protheroe & Morris' Rooms.
SATURDAY, Aug. 21	Sale of Imported and Established Orchids, at Stevens' Rooms.

THE verdict of the foreigner is sometimes, and with some truth, looked on as forecasting the judgment of posterity. The inference is not altogether to be depended on, because posterity at least is likely to be absolutely disinterested, while the opinion of the foreigner is likely to be tinged with a friendly bias, or it may be with a spirit of animosity, according to circumstances. Still, under any circumstances, it is well to know what other people think of us, good or evil, so long as we can place reliance alike on their judgment and their honesty. Our Belgian friends may be relied on in both particulars. We have had far too many proofs to doubt them, either in the one or in the other quality, and, therefore we think that some interest may be felt in the judgment of a highly competent and thoroughly honest observer in the case of the late LIVERPOOL EXHIBITION. We all of us know that that effort was not so successful as it ought to have been, and we may, as we believe, with the utmost complacency say, that the fault—if fault there be—does not lie at the door of the horticulturists. They, with singular unanimity, advocated the holding of a provincial show, at Liverpool, and they did their best to make it the success that it was in some particulars, but which it was not in others. That it was not the fault of the exhibitors was obvious to every specialist, but as home specialists may not be thought to be independent witnesses in their own cause, we think it may be without interest to cite the opinion of M. PYNÆRT as given in the *Revue de l'Horticulture Belge*. The genial Professor in the Ghent School of Horticulture devotes a long article to the Liverpool show, from which we may extract some remarks which have the more value, as the writer is not only a practical man, familiar by personal experience with the working of the minor shows in Belgium, which are so numerous and so good, but also with those magnificent "quinquennials" which at their stated intervals attract the horticultural public from all corners of Europe. When he describes the Liverpool exhibition as a "*magnifique succès*," we may be sure that we ourselves have some reason to be satisfied with our endeavours, even though circumstances were against us. If, says the writer, relatively few large Palms, Cycads, and Tree Ferns were shown, there was an abundance of Ferns, Crotons such as cannot be seen elsewhere, pot Roses covered with flowers, and a veritable "orgue" of brilliant flowers of Dipladenia, Ixora, Pelargonium, Finks, herbaceous plants, &c. Such Roses, he continues, he had thought it impossible to be procured outside the land of Roses. The Orchids, too, surpassed his expectations, but he returns to the Crotons of Messrs. KER as specimens of irreproachable cultivation and admirably arranged. The Caladiums of Messrs. LAING & CO. divide in his opinion with the Crotons the honours of the show, but he has still a word, too, for a class of plants which we had thought to have declined of late years in our exhibitions—we allude to the specimen stove and greenhouse plants. These, our colleague speaks of particularly as *Plantes de culture*, which may be freely translated as speci-

men plants, and he points out that they confer on our summer exhibitions a splendour rivalling the magnificence of the Azaleas at the spring exhibitions in Ghent. Specimen plants of this character have a little gone out of fashion in this country through their sameness. The specimens now exhibited will not quite equal what were shown twenty or even ten years ago, and the reason is not far to seek. The plants of course afford evidence of superior skill and constant watchfulness, but they palled by their monotony, and the formality with which they were trained. They were grand adjuncts to a horticultural exhibition, they were objects of intense interest to the gardener in whose charge they were, and they excited the emulation of other gardeners, but to the proprietor they were of relatively little interest unless he himself were bitten with the exhibition fever. They occupied much room. The ladies of his family could not cut and come again at them. They were ill-suited for the boudoir or the dinner-table—they furnished neither bouquets nor button-holes. The botanist and real plant lover, on his side, after he had become accustomed to the evidence of superior cultural skill, of which they afforded such remarkable illustration, became, like the rest of the world, wearied with their monotony—a monotony such that newspaper reporters could count on the re-appearance of the "elephants" at show after show, not only in successive years, but at successive shows in the same year, so that the possibility of writing a fairly accurate report of a particular show without having gone near it was by no means a hypothetical vision. But if this were the case, what shall we say of the existing dearth of new plants? Our colleague has noted the fact which has been obvious to us for some time past. If we except new varieties of Orchids, differing from the old in a spot or two more or less, in a depth or a dilution of colour, and to which there seems no end, we have had very little else to record in the form of new plants for the last year or two. How few have been exhibited at the fortnightly meetings of the Royal Horticultural Society, how few have fallen to our lot to describe and figure. There is, says our Belgian colleague, at this moment an "inexplicable dearth of new plants. What does this mean? Are connoisseurs more particular (*difficiles*), or are the exhibitors of novelties more conscientious?"

Lastly, we may be excused for quoting the remark that the horticultural Press of this country is a great power. It, says M. PYNÆRT, this country may boast of possessing without any special school, with no State aid, numerous gardeners well informed in all branches of horticulture, it is to its horticultural Press that these results are due—a Press conducted by eminent men of science, to whom week by week intelligent practitioners lend their aid, contribute the results of their observations, and the record of their failures, as well as of their successes. This is a compliment to the English gardening Press which they may accept for its obvious sincerity, and from the consciousness that, successfully or otherwise, the horticultural Press, while not unmindful of its own interests, sees that those interests are best secured by constant endeavours to promote the welfare and stimulate the progress of horticulture.

— MR. EDMUND BAKER.—Those of our readers (and they must be many) who have profited by the learning and good nature of the father will rejoice at the success of the only son of Mr. J. G. BAKER, F.R.S., of the Kew Herbarium. Mr. EDMUND BAKER has been highly successful at the recent examinations of the Pharmaceutical Society of Great Britain, having gained a Certificate of Honour for Chemistry, the Silver Medal for Botany and Materia Medica, the Bronze Medal for Practical Chemistry, the PEREIRA Silver Medal, and the HILL'S books

prize, and the PETER SQUIRE books prize for Practical Botany. The PEREIRA Medal and the prizes of books are open to all comers. This event must be very gratifying to the botanists at Kew, following as it does so quickly after the great college successes of Mr. FRANK OLIVER, the only son of Professor OLIVER.

— MAPS AT THE COLONIAL EXHIBITION.—The information to be derived from this exhibition seems endless. No such opportunity for studying the geography and products of our various colonies has ever been afforded. The ordinary visitor has too much to attract his attention to be able to look at maps, but we may recommend those who are something more than sightseers to look at the grand maps of South Africa, New Zealand, &c. They give juster ideas of the size and physical features of a country than any other means. Mr. BOLUS' monthly rainfall maps for the various provinces of South Africa are most instructive and should be very serviceable to growers of Cape plants.

— DOUBLE FLOWERS.—It would seem as if the autumn season had some influence in the production of double flowers; in any case, setting aside Begonias, Fuchsias, and Pelargoniums, which are produced under glass, there were to be seen, as forming special features, at South Kensington on Tuesday last, double Zinnias, Petunias, Balsams, Hollyhocks, Asters, Finks, Dahlias, and Roses.

— GRAND NATIONAL DAHLIA SHOW.—The Hon. Secretary, Mr. T. MOORE, writes as follows:—"Will you kindly allow me to remind growers and exhibitors of the Dahlia that the show will this year take place on September 3 and 4, at the usual place, the Crystal Palace, Sydenham, and that the TURNER Memorial Prize (Silver Cup, value £10, for twelve show and six fancy Dahlias) is open to further competition on this occasion. Entries for the show should be sent to Mr. MOORE (Botanic Garden, Chelsea, S.W.) on or before August 27. Schedules may be had on application, and donations to the Prize Fund will be welcomed. The schedule of the Dahlia Show comprises eighteen classes, and the attractions of the show will be enhanced by a display of Gladioli, Asters, Hollyhocks, and other flowers not in bloom at the date of the previous horticultural exhibitions. The fruit show to be held in conjunction with that of the Dahlias should likewise be a good one, the prizes offered being numerous and attractive.

— NOMENCLATURE.—The nomenclature question has wide ramifications. Seedsmen complain that varieties sent out by them under one name are sent out by other seedsmen as novelties under another name, or perhaps with a qualification, such as So-and-so's Improved Poppin, or what-not. Messrs. HURST & SON send us a complaint that others in the trade are sending out under the name of Duke of Albany a Pea, of which they send samples, certainly inferior to the true Duke of Albany, and which we cannot recognise for certain, but which appears to be Duke of Connaught; in any case it is not what it is said to be, and it is decidedly inferior to it. The Vegetable Committee of the Royal Horticultural Society might report on such cases, and it is certainly their duty to withhold certificates till the exhibit is, so far as practicable, correctly named. Grumblers should also remember that the trials at Chiswick are constituted for the very purpose of settling the synonymy.

— COVENT GARDEN MARKET.—There is now, as is to be expected, a large supply of English fruit for sale, but at the same time the foreign produce finds a ready sale. Plums, &c., are of both kinds, but Strawberries, Raspberries, and other bush fruit are doubtless home-grown. Immense quantities of Gooseberries arrive, but do not sell well. Some fine English Pines may be obtained, but the foreign-grown fruit is almost if not quite as good, as the time taken on the voyage to England is greatly diminished now-a-days. English Apples are just commencing their season, but the Pears (Williams) offered for sale are foreign. Grapes (Hamburgh and Muscats) are plentiful, and here again the supply is both home and foreign; the quality and size of the berries are very fine. Other household fruits comprise Figs, Melons, Peaches, Nectarines, &c.; a few Nuts may also be

seen. Vegetables are now about as good as they will be. Salads of all sorts, Radishes, Cauliflowers, Beans, Artichokes, Tomatoes, Onions (Spanish and sprig), Cucumbers, and a few others being very plentiful. Peas, of which the last are almost over, are very few, but of good quality. The plants in pots comprise many different kinds, a great selection being offered: Carnations, Ferns, Balsams, Lilliums, Begonias, Palms, Pelargoniums, Fuchsias, &c., being the most plentiful. Of cut flowers there is an almost endless variety, and we can only say that Composites and Centaureas are plentiful in many forms, Asters, Roses, Pelargoniums, Mignonette, Myosotis, Lilliums, Stocks, may be cited as the most plentiful. There are many hot-house flowers also. The end of summer is announced by the appearance of the Lavender and the berried branches of the Mountain Ash or Rowan tree.

— TWO NEW SPECIES OF RHODODENDRON.—*Rhododendron Smirnowii* is a tall shrub with branches, leaf-stalk, flower stalk, and the underside of the leaf covered with soft white wool-like hairs. The flowers, which are small, of a carmine-purple colour, are disposed in terminal umbels. *R. Ungeri* resembles the above in general characteristics, has smallish white flowers which are on the inside and outside of the throat covered with down. Both of these species were discovered in the district of Batoum by Baron UNGERN-STERNBERG, who found them growing under the protection of trees of *Picea orientalis*. Figured in *Garten Flora*, July 1.

— BEGONIA HOEGEAANA.—A beautiful climbing species, attaching itself by means of air roots to the walls of the stove. The flowers are white, and the leaves dark green, to cm. long. It is allied to *B. nitida* but differs from that species in the divided triangular raceme, much smaller flowers and almost oval leaves. Collected by H. HOEGE in the neighbourhood of Jalapa, Mexico. *Garten Flora*.

— A PLEASANT RECOGNITION.—MR. JOHN MARTIN, who has lately been employed in laying out and improving the estate of W. WEST, Esq., of Barcot, near Faringdon, and who has succeeded in converting the estate from its previous barren state to one of a fertile and attractive character, has been presented with a valuable gold watch by his employer, as a mark of his appreciation of Mr. MARTIN'S services.

— ROYAL BOTANIC SOCIETY OF LONDON.—The annual meeting of the Fellows of this Society was held on Tuesday last, at the house of the Society, Inner Circle, Regent's Park. Mr. J. P. GASSIOT, Vice-President, occupied the chair. The forty-seventh annual report of the Council stated that although the number of new subscribers was small, the Council believed this to be but a temporary lull. The total receipts of the year had been £6038 18s., as against £6487 17s. 10d. in the previous year. The Council were cautious now in expenditure, and in some cases had been able to reduce the working expenses. A new hardy fernery had, however, been constructed, and a new vane tower had been erected, the latter being intended for the new sunshine recording instruments. Special reference was made to the facilities that had been afforded to the Indian and Colonial visitors to this country, which had been gratefully acknowledged, and it was further pointed out that another example of the Society's usefulness was the large number of students who year by year applied for admission to the gardens for study of various kinds, as well as for specimens to assist them in their studies. The number of artists and students on the books was 729, and of cut specimens supplied, 24,547. Various propositions were submitted by different members, but all of them fell through for want of supporters. A vote of thanks was passed to the Duke of TECK for his services as President.

— SECRETING GLANDS ON CHYSIS AUREA.—In addition to that mentioned at p. 84 of the present volume, and that figured and described in vol. xxiv., p. 20, fig. 6, of this work, a similar instance in the case of *Chysis aurea* may be mentioned. Just when the flowers are on the point of opening or fully expanded, the sepals are seen to be dewed all over with little drops of moisture, secreted by glands, apparently irregularly scattered over their backs. The species of *Chysis* have fleshy flowers, and waste products may not infrequently be exuded by them during the many chemical changes that take place while the flowers are

being matured for fertilisation. A specimen flowers annually in the Orchid-house at Kew, and not only does it show the glands but it is habitually self-fertilised. Whether this is an individual character, or more or less conspicuously developed in different individuals or common to the species, would require an examination of specimens from as widely different localities as possible. But the specimen at Kew does not always behave alike in successive years. Occasionally the flowers last in beauty for some considerable time, while in other seasons they scarcely expand before the effects of fertilisation exhibit themselves by the shrivelling and drying up of the flowers. A great quantity of viscid matter is developed from the rostellum, by means of which the pollen tubes develop *in situ*, and pass down through the viscid matter to the stigmatic disc, when the column begins to swell and the flowers to fade. The species was figured in the *Botanical Register*, t. 1937.

— NATIONAL CHRYSANTHEMUM SOCIETY.—This important body has forwarded to us its *Catalogue of Chrysanthemums*, duly corrected down to date, thereby rendering great assistance to those who desire to enter the ranks of the Chrysanthemum growers. The synonyms given are very useful to beginners.

— A SUCCESSFUL FLOWER SHOW.—As an instance of a truly successful flower show in the provinces, we may point to that recently held in the Abbey Park, Leicester, on the 2d inst., when the show was visited by nearly 40,000 people—the takings amounting to £640. After paying all expenses a balance on the right side of £450 remained. Let us hope that this successful initial venture—with its handsome balance—may be the means of resuscitating the at present extinct Leicestershire.

— SCOTTISH ARBORICULTURAL SOCIETY.—The members of this Society commenced their excursion on Wednesday, the 4th of August, under most favourable circumstances. It had been arranged that the visit this year should be to the woodlands of the Island of Bute, and to the policies of Inverary, permission having been obtained from the Marquis of BUTE and the Duke of ARGYLE. Next week we will give our readers an account of the excursion to the various places.

— PRESENTATION TO MR. INGRAM.—On Thursday, August 5, a presentation of plate and a cheque for £90 was made to Mr. W. INGRAM of Belvoir, "in appreciation of the manner in which he originated and developed the spring gardens at Belvoir." If this were the only ground for recognition we do not know that the matter would be of public interest, but as many of our readers know, and as we have had many years experience, Mr. INGRAM'S merits have a much wider scope, and we rejoice that they have found such pleasing recognition. We shall give in our next issue a fuller account of the ceremony of presentation than circumstances now allow us to do.

— EXTRAORDINARY FORECAST OF THE RESULT OF THE GENERAL ELECTION.—On the day of the Manchester and Salford elections—July 2nd—Mr. BRUCE FINDLAY of the Botanical Gardens, Old Trafford, writing to Mr. BENJAMIN ARMITAGE, of Sorrel Bank, Pendleton, said:—"There will be six Conservatives returned to-day for Manchester and Salford. Final result: 390 Conservatives and Unionists, and 280 Gladstonians." This was the exact result according to an analysis published on July 24th.

— SUPPLY OF BULBS TO LONDON PARKS.—The Metropolitan Board of Works have accepted the tender of Mr. E. S. Williams, Victoria and Paradise Nurseries, Upper Holloway, London, N., for supplying Hyacinths, Tulips, Crocus, Daffodils, &c., for Finsbury Park, Southwark Park, Leicester Square, Victoria Embankment and Chelsea Embankment.

— GARDENING APPOINTMENTS.—MR. JAMES McCULLUM has been appointed Gardener to Lady HARRIET WARDE, Knotley Hall, Leigh, Tunbridge, Kent.—MR. J. BAILEY, late Foreman at the Gardens, Shoreham Place, Kent, has been appointed Gardener to Sir E. DORINGTON, Bart., M.P., Lypiatt Park, Stroud, Gloucestershire.

THE NOMENCLATURE OF ORCHIDS.

THE difficulty in the nomenclature of Orchids, especially that raised at South Kensington in connection with the naming of varieties by amateurs and private growers, is only one phase of the question, which is daily becoming a matter of serious apprehension. Owing to the vastness of the order and the almost endless series of closely allied species occurring in some of the genera, botanists of all ages have experienced great difficulty in defining them. Not only is this the case with specific distinctions, but even with closely allied genera, such as *Oncidium*, *Odontoglossum*, and *Miltonia*. This may easily be inferred by reference to Lindley's works, where, although he is known as the greatest exponent of the order, his writings teem with difficulties and the confessions, not only of other botanists' mistakes, but of his own. In the *Sertum Orchidaceum*, under plate xxv., he makes an attempt to define *Oncidium*, *Cyrtorchilus*, *Miltonia*, and *Odontoglossum*, but after the examination of a great many other species, he was under the necessity of dropping out *Cyrtorchilus* as a genus altogether, and merely regarding it as an artificial section of *Oncidium*. The species originally described under *Cyrtorchilus* by Humboldt, Bonpland, and Kunth were distinct in themselves, but are connected with other species by numerous insensible gradations. The genus is now scattered all through the other three genera above mentioned, and even in *Cyrtorchilus maculatum* var. *parviflorum*, Lindley discovered characters breaking down *Cyrtorchilus* as a section. The *Genera Plantarum* does not adopt the above as a section, but includes the above species in section *Planifolia* of *Oncidium*. *Miltonia*, now pretty clearly defined in the *Genera Plantarum*, includes several species most commonly grown in gardens under the name of *Odontoglossum*, showing that when plants once get distributed under certain names it seems an insurmountable task to endeavour to correct the mistakes, or induce horticulturists to adopt the correct name, which to them seems merely an alternative or a new one. *M. vexillaria* is one of the most popular, commonest, useful, and most beautiful of the genus, but will probably retain a place in gardens for years to come under the name of *Odontoglossum*. The same objection applies to *M. Koehlii*, *M. Phallopis*, *M. Endresii*, and *M. Warszewiczii*, some of which have been variously named, but generally *Odontoglossum*. The last-named species is cultivated under the names of *Oncidium Weltoni*, *O. fuscum*, and *Odontoglossum Weltoni*. *M. Endresii* is figured in the *Botanical Magazine*, t. 6163, under the name of *Odontoglossum Warszewiczii*, but being a true *Miltonia*, and the later specific name already employed, it has been found convenient in the *Illustrated Dictionary of Gardening* to name it after Endris, who first introduced live plants of it to this country. Another species may here be mentioned, namely, *M. Havessens*. It is figured in the *Botanical Register*, t. 1627, as *Cyrtorchilus flavescens*, and is a connecting link between *Miltonia* and *Oncidium*. The whole form a sufficiently natural group, and *Bentham* must have been misinformed when he states (p. 563) in the *Genera Plantarum* that *M. vexillaria* and its allies do not hybridise with the other species of *Miltonia*.

Under *Mesopididium* a number of species have been grouped, of very different characters and construction, and which nevertheless maintain their erroneous appellations in many collections. The typical and originally described species is now considered as a species of *Odontoglossum*, while all the others more recently grouped under the genus have been referred to various others. One of these is the popular and well-known *Ada aurantiaca*, while equally well known are *Cochlidium rosea*, *C. sanguinea*, and *C. vulcanica*. *C. rosea* was described under *Odontoglossum* by Lindley; but the structure of the flowers bears a close resemblance to that of *Epidendrum*, especially those of *C. rosea* and *C. vulcanica*, while the pollinia at once refer them to the great tribe *Vandæe*.

Arachnantea Cathartii still continues to be grown in gardens under the name of *Vanda*, although in structure it is distinctly different from the latter genus. The same statement applies to *A. Loweii* (the old *Vanda Loweii*), with its long slender racemes of large curiously dimorphic flowers, and which serve as a

connecting link between the broad-petaled *A. Cathartii* and the rest of the genus. The above-mentioned are but a few of the many rectifications needed in the great family of Orchids, for some of the genera, such as *Aerides* and *Odonoglossum*, are still very badly defined. *J. F.*

FRUIT NOTES.

MORELLO CHERRIES: BORDERS TURFED OVER v. CULTIVATED BORDERS.

HAVING had considerable experience with both the above modes of cultivation, I should like to say a few words on this subject. We have a large quantity of trees on north walls in these gardens, the borders of which are turfed over, others with cultivated borders, for other purposes, but from those trees with the borders turfed over we gather the finest fruit; these trees are in the best of health, and do not have any branches die off, as is so often seen on those growing in cultivated borders. In my opinion this is certainly by far the best way to grow these Cherries as they withstand a dry season better, and also yield a larger quantity of much finer fruit, than those in cultivated borders, even with heavy mulchings of manure. And to those who have not already tried this system, I can highly recommend it after some years' experience of both systems.

PEACH ALEXANDER.

I gathered fruit from this variety on July 31, from a tree on the open wall, at the same time we were gathering Hale's Early from an unheated Peach-house. I am quite convinced that Alexander is much earlier than Hale's Early, and intend having the tree removed to the early Peach-house this autumn; the fruit is of good size, richly coloured, and of excellent flavour. *Edward Ward, Howell Gardens, Bromsgrove.*

PEAR DELICES D'HIVER.

Fruit large, elongate pyriform, with a short stalk set obliquely; eye shallow; skin russet; flesh moderately fine, juicy, acid. Season, December to January. *Bulletin d'Arboriculture.*

WATERLOO PEACH.

Last week (August 3) I saw at Slough, in a garden belonging to the Royal Nurseries there, a young tree of this Peach covered with largish, very high and brightly coloured fruit. Mr. Arthur Turner informed me that he had been taking Peaches from this tree for a fortnight, and also that in a friend's garden the first fruit of the same variety had been gathered more than three weeks previously. The flavour, as in that of all very early Peaches, was not first-class, but was quite equal to Hale's Early in this respect. There was no coping on the wall, therefore Waterloo, if it will succeed elsewhere as it does at Slough, may be written down as an invaluable early outdoor Peach. *J. T. Galton.*

ALPINE PLANTS IN SEASON.

GERANIUM ARGENTHEUM.—Comparatively few gardens can boast of this choice species, although it has been a constant or intermittent inhabitant of British gardens since 1699, when it was introduced from South Europe. The protection of a cold frame was considered necessary for its welfare, but a plant on the rockery at Kew has stood out for several years unprotected, bravely holding its own like a true alpine, and although increase is very slow, the plant continues to throw up fresh flowers great part of the summer. The twin-downed peduncles just rise above the foliage, bearing large pale rose or pink flowers, beautifully striated with darker veins. Not only is this species distinct and choice in its flowers and dwarf habit, but the silvery five to seven parted leaves furnish a delicate background to the still more delicate and attractive flowers. For rockwork it is even dwarfer and more compact than *G. sanguineum* var. *prostratum*, and if not rarer in a wild state is so in this country. Like most of the Geraniums, it delights in an open exposure in a situation that is well drained and rather dry than otherwise. Under these conditions it ripens perfectly, which is a great assistance in helping it to withstand our extremely changeable winter. There is a figure of the species in the *Botanical Magazine*, 504, and another in Sweet's *Geraniaceae*, 59.

DRYAS OCTOPETALA.

Of the two or three species recognised by science, not the least ornamental or useful is that of our native plant. It is essentially alpine in habit and distribution, ascending to an elevation of 2700 feet in some of the more mountainous districts of this island. On rockwork, of course, it is extremely hardy, and will thrive in the most exposed places, creeping over stones and rocky ledges, which it decorates in the most happy manner. In the neighbourhood of London, where the rainfall is light and the atmosphere dry, a good depth of soil is necessary in order that the roots may penetrate deeply and establish themselves beyond the reach of drought. For the same reason a peaty soil is often used as affording a cool medium into which the roots readily descend, after which the prostrate, much branched leafy stems will closely carpet the ground. Under such conditions no shade is necessary even in the climate of London, but the plants will display a healthy appearance and flower freely, extending over a considerable period, about this time. The coarsely-toothed Oak-like leaves are evergreen, and from their fancied resemblance to those of the latter tree suggested the generic name *Dryas*, meaning an Oak. The comparatively large white flowers are carried above the foliage on short peduncles, and when the petals have dropped the feathery styles elongate, and, becoming conspicuous, prolong the beauty of the plant for a considerable period. It is figured in *English Botany*, 451.

LINARIA ALPINA.

Singularly enough this alpine gem was introduced more than 300 years ago, yet the number of gardens into which it has found its way is as nothing compared with the number of years since first introduced from Austria. It enjoys a pretty extensive distribution on the Alps of Central and South Europe, and ought therefore to be harder than it is generally considered to be. The protection of a cold frame was formerly considered essential to preserve it in winter, but, in the neighbourhood of London at all events, this is not requisite, save in exceptionally severe winters. Like many other species of *Linaria* and *Antirrhinum*, it delights to insert its roots in the crevices of rocks and old walls, when it, conjointly with its congeners and near allies, is able to exist comfortably; whereas the same plants in rich moist soil would in most cases be killed in a severe winter. A full exposure to the sun, or at least to light, is a large item in its requirements, and it would soon appear unhappy if coddled in any way, especially in an imperfectly lighted place. The plant is perennial, and easily propagated by cuttings in sandy soil under a handlight. The slender procumbent stems bear the flowers in short numerous flowered racemes towards their apex, and are well furnished with linear leaves, four in a whorl, of a deep glaucous colour, characteristic of several other species, such as *L. tristis* and *L. purpurea*. The flowers are violet-purple, with a deep orange palate, and, though moderately small, are extremely pretty or fascinating. There are figures of the species in the *Botanical Magazine*, 205, and in *Flore des Serres*, 2128.

CYANANTHUS LOBATUS.

It is probable that this curious and uncommonly pretty little Campanulad has several times been lost and again raised from seeds since its first introduction in 1845. With most cultivators it proves somewhat difficult to manage, but to those who have made a tolerable acquaintance with it the difficulties dwarf into insignificance. Plants have been grown both on the old and new rockeries at Kew, but those succeed best planted in a cool, moist peaty bed, with an eastern aspect and full exposure to light. They thus receive the benefit of the morning sun, but are screened from direct sunlight for the rest of the day by some Pine trees, sufficiently distant not to affect the bed with their roots. By such treatment healthy plants are developed that commence flowering in the latter end of July or the beginning of August, and keep up a succession for several weeks. The flowers are produced singly at the ends of ascending leafy stems, and are of a beautiful light blue, with a wide spreading or reflexed lamina curiously bearded around the orifice with hairs of the same colour or paler. Of the six known species this is probably the finest and the best known, and ought to be harder than cultivators seem to reckon it, seeing that it inhabits the Himalayas at elevations ranging from 12,000—14,000 feet. The plant is liable to variation, if we are to judge from figures, or it may be

badly executed, but there is a tolerably good representation in the *Botanical Magazine*, t. 645.

GENTIANA SEPTENTRIONALIS.

The original and typical form of this species, figured in the *Botanical Magazine*, 1229, has ovate three nerved leaves, and does not seem to be so frequently cultivated now as a broader leaved form, with ovate-cordate five nerved leaves. This latter form is figured in the *Botanical Magazine*, 1410, and more recently at 6497. By some mistake the latter had come to be known in gardens and disseminated under the name of *G. gelida*, a Siberian plant, with large yellow flowers, and possibly lost to cultivation. *G. gelida* is also recorded as coming from the Caucasus, while *G. septentrionalis* also comes from the latter place—the Crimea and the Persian Alps in the neighbourhood of the Caspian Sea. Of the dwarf blue-flowering species it is one of the prettiest, and at the same time most easily and successfully cultivated. The stems are ascending, bearing a cluster of deep blue flowers, finely spotted in the throat, and under ordinary circumstances do not exceed 6 or 8 inches in length. The flowers are also comparatively large for the size of the plant, with the corolla usually five-cleft at the mouth, and having five short, lacerated, intermediate segments. Pallas, who first named the species, must have described it from very exceptional specimens, as another acute botanist says that not one in a thousand has a seven-cleft corolla, as the specific name would lead us to suppose. Like most other Gentians this species is partial to a moist soil, and provided that is secured, it is a long-lived perennial, flowering annually without any trouble. If planted on rockwork, with an eastern aspect, and screened from the mid-day and afternoon sun, it will thrive very satisfactorily. *J. F.*

STANCLIFFE.

[SEE SUPPLEMENTARY SHEET.]

In our number for December 27, 1884, we gave a double page illustration of the remarkable garden carved out of the hillside at Stancliffe, near Matlock. Nothing can exceed the boldness and beauty of the rock scenery here, and the utmost has been done to accentuate the fine scenery by judicious planting.

Sir Joseph Whitworth, to whom this unique estate belongs, has spared neither pains nor expense to clothe the barren sandstone rock, and to bring out in the most effective manner the contrast between the boldness and majesty of the rocks and the richness and variety of foliage and flowers. What Mr. Dawson has succeeded in effecting under Sir Joseph's directions is amply detailed in the number already indicated, but we gladly avail ourselves of another opportunity of illustrating this fine garden as remarkable for the variety and vigorous health of the trees and shrubs in general as for the rock scenery and excellent keeping.

We are indebted to the kindness of Mr. Dawson for the following more detailed account of the various plants wherewith the rock garden is planted:—

This makes a charming scene, it being the *point de vue* of a very fine crescent, at the foot of which, in its hollow, is a small piece of ornamental water, which washes the base of the rocks (shown in the illustration) which rise out of it. On one of the overhanging cliffs, and springing out of a carpeting of *Cotoneaster microphylla*, which grows here in great abundance, is a well grown specimen of *Picea lasiocarpa* about 15 feet high. Behind it are two *Cedrus Deodora*, whose drooping habit of growth contrasts favourably with the more formal looking *Picea*. Still higher on the slope are several good specimens of *Wellingtonia gigantea*, which do well here so long as they have sufficient shelter from the rough winds with which the district is often visited. This portion is known as the Wellingtonia bank. Amongst the latter there are several fine plants of *Cedrus atlantica*, *Pinus Cembra*, and *Pinus austriaca*, which are readily distinguishable in the illustration from the various other forms with which this bank is covered. Conspicuous amongst these are dwarf growing Heaths in variety, *Rhododendron hirsutum*, *ferugineum*, and *Wilsoni*, and *Gaultheria Shallon*, which are planted in masses; the rocks forming its base are chiefly occupied by *Cotoneaster microphylla* and different varieties of *Berberis*, with here and there a mass of *Sweet Williams*, now at this season

at their best. Half-way up this bank, along a ledge of varying width, but concealed by the shrubs as seen from below, is a walk 9 feet wide, with a narrow verge of turf, which widens here and there into small bays as space permits. This is called the Cavern Walk, because it gives the means of access to a cavern in the rocks of considerable dimensions, which is composed of huge blocks of sandstone, and bears traces of a great upheaval in some long-past age. Passing along this walk a fine collection of *Holcus* is seen occupying the ascending banks. On the lower side of the slope, between the level of the walk and the rocks, which rise out of the water before mentioned, are several groups of *Cupressus Lawsoniana* and other pyramidal trees, each of which is a specimen in itself.

SCOTCH NOTES.

ORCHIDS, &c., AT NUNFIELD, DUMFRIES.

MR. HENRY WALTER SCOTT exhibits at his fine place, Nunfield, near Dumfries, the same keen and intelligent interest in horticulture that his brother, Mr. George Scott, does at Wood Bank. In a number of well constructed houses there is a fine collection of miscellaneous stove and greenhouse plants, and a comprehensive selection of choice Orchids, all in the finest condition as regards culture. Among the Orchids in bloom we noted grand samples of the following:—*Oncidium intertextum*, with five enormous panicles carrying over 300 blooms; *O. macranthum*, a remarkable boldly marked variety; *O. Jonesianum*, flowering very freely in several distinct varieties; these were growing on bare blocks suspended near the glass, and had made fine growth; *Odonoglossum Pescatorei* bearing two strong spikes with over 100 blooms of medium-size but deep rose-tinted and of great substance; *O. Lindleyanum*, a fine plant in a 9-inch pot, bearing twenty-five spikes—a beautiful variety; *O. Roezlii*, a very healthy plant, covered with large clearly coloured flowers. In Cattleyas in bloom were some fine samples of *C. Gaskelliana*, one variety with unusually large deep purple-rose blooms being very attractive; and a very fine form of *C. Eldorado* flowering freely. A grand plant of the former species, throwing up thirty-one spikes of bloom, will be something of a spectacle to itself shortly. *Dendrobium Falconeri*, a magnificent specimen on a block, was flowering in great profusion; *D. Bensoniæ* is remarkably well done here—Mr. Rowe, the gardener, grows it in pure cocoa-nut fibre; the growths are exceptionally strong, and even now well advanced in ripening. Other Orchids in bloom were beautiful plants of the curious *Masdevallia bella* and *Acuedes vivens*.

The Orchid baskets here are worthy of special remark. Mr. Rowe is not only a good cultivator, but a tasteful mechanic, as is exemplified in the numerous well adapted and handsome baskets he has in use. Instead of the usual square form commonly seen, they are either circular or octagonal in shape; and the Teak bars of which they are made are placed perpendicularly instead of horizontally; these are kept apart by means of small blocks of Teak at the top and bottom, those at the top being a little thicker than those at the bottom, thus increasing the diameter upwards, very much in the way of a well made tub. All the pieces are bound firmly together by a wire passing through the centre of each piece. The superiority of these in point of form over the heavy looking squares commonly used, is very obvious, especially in the larger sized baskets.

Among the general collection of plants in houses apart from those devoted to Orchids were some splendidly coloured *Crotons* of the best types. There was also a fine group of *Nepenthes*, among which was conspicuous *N. Mastersii* ×, showing enormously large and highly coloured pitchers. *Adiantum Williamsii* is here grown in a cool-house instead of in the stove or intermediate-house, as is often done. The result is most satisfactory. The young fronds show none of that tendency to damp off which has operated against the more general adoption of it in collections that its distinct character, elegance of form, and pleasing tint of colour entitle it to. We have never seen it used in baskets till we saw it here, where it is very successfully done in that style, and very beautiful it is.

THE ROSE DISPLAY AT THE INTERNATIONAL EXHIBITION, EDINBURGH.

The proposed Rose display that was announced to take place in the Exhibition buildings, Edinburgh, was, from causes that need not be commented upon, a very poor affair as regards the numbers that took part in it. Only two growers came forward with collections, but as regards the quality of the blooms and the rich variety of the most popular and the newer sorts exhibited, nothing was left to be desired. Messrs. T. Smith, nurseryman, Stranraer, N.B., and Hugh Dickson, nurseryman, Belmont, Belfast, had the field to themselves, and each kept up a display daily of from 250 to 350 blooms for about a fortnight, closing on Saturday last. The exhibits of both were throughout of the most creditable description. The Irish Roses maintained the most uniform claims to superiority in regard to size, substance, and richness of colouring throughout the period during which the display lasted, but each exhibit had its own individual merits; for instance, *Merveille de Lyon*, from Stranraer, eclipsed completely those from Belmont; they were, in fact, superb in size, substance, and colour, proving it the most desirable white Rose in cultivation. On the other hand, Teal Roses from Belmont were remarkably well done; splendid samples of *alba rosea*, *Perle des Jardins*, *devoniensis*, *Madame Marie Van Houthe*, *William Allan Richardson*, *Niphotos*, *Souvenir d'Elise*, and others being exhibited daily in perfect condition.

In connection with the above display Messrs. Dickson & Co., Edinburgh, had a continuous exhibit of Pansies, Carnations, their new white Pink Mrs. Welsh, a very clear white variety, with medium sized, neatly-formed flowers, obviously well adapted for cutting and for border decoration; a grand display of *Dianthus Napoleon III.* in splendid size and colour of blooms; a collection of hardy herbaceous cut flowers, among which were fine samples of *Lilium Brownii* (true), and *L. Harrisii*. There were also some very fine blooms, evidently from under glass, of the following Teal Roses:—*Madame Lambert*, *Jean Dacher*, *Madame Camille*, and *Grace Darling*.

Messrs. Dobbie & Son, of Rothesay, sent a good display of excellent Pansies and other florist's flowers during a few of the earlier days of the display, but these were the only contributors to what would undoubtedly have been a most attractive feature to thousands of visitors to the Exhibition daily had there been adequate encouragement given to induce a more general response to the invitations sent out by the executive of the Exhibition to growers to take part in the display. A.

LILIUM HUMBOLDTHI.

This magnificent species of Lily is now to be seen in splendid condition in the nurseries of Mr. Service, Maxwellton, near Dumfries, at the present time. Old established clumps are sending up stems 7 to 8 feet in height, bearing an average of two dozen blooms each. A hardy plant of such noble character as this ought to be more frequently seen in private gardens than it is. Towering above masses of dwarf shrubs in ornamental grounds, its splendid panicles of light yellow flowers would be most effective and pleasing.

WHAT IS A HYBRID PERPETUAL ROSE?

A VERY eminent legician has told us that definitions are dangerous things, and that, however carefully made, they will not always "go on all fours," and therefore I feel that in attempting to do so with regard to hybrid perpetuals I am treading on difficult and, it may be, dangerous ground; indeed, it may be perhaps asked, "Why attempt such a thing at all? We all know what a hybrid perpetual is." Do we, indeed? Well, I very much doubt it; and there are several good reasons why we should attempt to clear up the matter. The name is a misnomer, the French form, "*hybride remontante*," being a much more correct one, and, I imagine, will give us a better chance of deciding the question with which I have headed this paper.

An attempt has lately been made to confuse our nomenclature of Roses still more by making hybrid Teas a separate class, for it is a class which ought not to have any separate existence, and the National Rose Society has, I think, done well in discountenancing it by deciding that all so-called hybrid

Teas must be shown as hybrid perpetuals. This was but the logical conclusion from their former rule, that they could not be shown amongst Teas or Noisettes. I think a moment's consideration will show that this is a wise decision. If we take some Roses which have always appeared in the catalogues as hybrid perpetuals we shall find, I think, that they would be as much entitled to be called hybrid Teas as those which are specially so designated. Take, for example, *La France*: has not this as much Teal blood in it as *Countess of Pembroke*?—indeed, Mr. Guillot has lately relegated it to the class of hybrid Teas, and the same may be said of *Captain Christy*; and if we are to put into the hybrid Teal class those which have any Teal blood in them, where are we to stop? Are they to be octo-roses, quadroons, or creoles? Is the first issue of a hybrid and perpetual to be a hybrid Teal? What is to become of their issue? Or if a Rose has originated, as many of our very best flowers have, by chance fertilisation, who is to decide, or what is to decide whether they belong to hybrid Teas or hybrid perpetuals? Another reason is the very equivocal position that some Roses have occupied; at an exhibition last year that fine Rose, *Lady Mary Fitzwilliam*, was in a stand for twenty-four hybrid perpetuals; the winner of the 21 prize objected to it that it was not a hybrid perpetual; the stand was disqualified, and the matter was referred to the committee of the National Rose Society, but almost at the time that it was so referred the society's medal for the best hybrid perpetual in the exhibition had been awarded at the provincial show of the society to the same Rose. The question was brought before the committee, which comprises some of the best rosarians in the kingdom, and the decision was, no matter what its parentage, it could not be shown as a pure Teal or Noisette, and must therefore be considered a hybrid perpetual.

But what is, then, a hybrid perpetual? Let us hear what the very best authority we have had upon Roses, the late Mr. Thomas Rivers, has said upon the subject. The hybrid China Rose owes its origin to the China Tea-scented Noisette and Bourbon Roses, fertilised with the French Provence and other Roses. As is well known they bloom but once in the season, but he says "some of these hybrids, unlike many plants of the same description, bear seed freely; these fertile varieties have been crossed with different varieties of China and Bourbon Roses. From seed thus produced we have gained a new race of autumnal Roses, bearing abundance of flowers during the whole of the summer and autumn, and are called hybrid perpetuals; their habit is robust and vigorous in a remarkable degree, and above all they are perfectly hardy." How wisely, too, he writes when he says, "Some authorities divide them into groups having affinities and characteristics. These groups only tend to confuse the amateur. It appears to me that we cannot simplify enough the classification of Roses. The division headed 'hybrid perpetual Roses' ought to include all of this origin deserving that name; and those that diverge from the general character may have their character attached to them." So that my contention about hybrid Teas has the *imprimatur* of this great Rose authority. I desire no better. A hybrid perpetual Rose is a hybrid whose second growth more or less frequently produces flowers, and hence, as these Roses make growth at various times after July, one often obtains autumnal blooms. This definition would exclude Gallier's hybrid Bourbons and some Roses which have been on their first introduction considered hybrid perpetuals but which are really only summer Roses, such as *Miss Ingram* and, I am sorry to say, *Hier Majesty*. I fear this latter will be a grievous disappointment to many who have regarded it as a grand addition to our hybrid perpetuals, but its raiser states that he never announced it as such, and that he cannot help what others have done. In looking at his own advertisement, one is bound to say that it is never called a H. P., although it so appears in those of others.

The distinction which I have made in my definition of a hybrid perpetual—that it more or less frequently throws a blooming shoot—will thus save from exclusion from this class some Roses which, if other words were substituted, would have to be relegated to the summer Roses. Take, for instance, *Madame Gabrielle Luizet*, this has by some been denied because, although beautiful in itself, it never gives another bloom; but this is not the case—it does, although but sparingly. In looking through my plants now, I see several shoots on which bloom-buds are living, although

by far the greater number are not. There are other Roses, however, whose claim to the distinction is never doubted, which show a similar character; there are, again, others which are almost certain to produce autumn flowers, and, as might have been expected, those in which there is a large infusion of Tea blood are the most constant in this respect—that fine and sweetly-scented Rose, La France, is amongst these, and the manner in which it throws its clusters of blooms evidences its origin. Captain Christy is another of similar character; Baronne Maynard, and others which approach to it, such as Boule de Neige, exhibit their affinity to the Noisette, and are always dependable for second blooms; while that grand Rose, A. K. Williams, which some will have to be too perfectly shaped, is one of the most certain of second bloomers; the same may be said of Baroness Rothschild.

There is another thing to be remarked about these Roses—that in some seasons they are more ready to produce autumn flowers than in others. I have known Charles Lefebvre one year to be very free in its second blooming, while another they are very rare; it is not, therefore, wise to deprive oneself of the pleasure of an autumn flower because at some seasons it may disappoint, and especially is this the case with regard to new Roses, although I very much fear our friends across the Channel are sending over some Roses whose hybrid perpetual character is very doubtful. In some the growth is so unmistakable that they are immediately detected, while in the case of others a little patience is required before the matter can be finally settled.

The definition I have given would also include what may be regarded as more purely distinct and separate sections—the Teas, Noisettes, and Bourbons. The former of these deserve more thoroughly than any other the name of perpetual bloomers; they come out before the 11th of 5, and they continue on throughout the summer, and until the heavy rains and early frosts of autumn put an end to their vigour. The Bourbons are a very tender class, and with the exception of that grand autumn flowering Rose, Souvenir de la Malmaison, are but little sought after; and this I have often seen both catalogued and exhibited as a Tea! Although it has no affinity with them, it is certainly one of the most constant autumn Roses we have, and whereas in its earlier period of blooming the flowers scarcely ever open properly, they usually do in the autumn. I may add that so convinced are many people of the value of the Tea Rose, that they are grubbing the hybrid perpetuals and planting them instead.

Let me add one word of thanks to "W. J. M." about his notice of Messrs. Dicksons' of Newtowards, new Roses. I hope that we may see something of them on this side of the Channel next year. *W.J.M. Rose.*

A REVISION OF THE GENUS PHALÆNOPSIS.

(Continued from p. 170.)

ENUMERATION OF SPECIES.

Section I. EUPHALÆNOPSIS, Benth. & Hook. f.—Petals much broader than sepals, rounded in outline, the upper edge much more curved than the lower one, and the base much contracted; lip with a pair of antenno-like appendages at the apex; the appendages sometimes reduced to a pair of short teeth; column without a long proboscis-like rostellum.

Eleven forms of this group have received distinctive names, of which ten are confined to the Philippines; the remaining one being found in Java, Borneo, Celebes, and the Moluccas. It is doubtful, however, whether more than six or seven are really distinct, and of these, three or four are by some considered as natural hybrids. P. Lowi has the broad petals of this section (where, indeed, Mr. Bentham places it), but the remarkable proboscis-like rostellum, the absence of the apical lip-appendages, and the deciduous leaves, are all such distinctive characters as to induce me to found an entirely new section for it.

1. *P. amabilis*, Blume, *Bidde*, p. 294, t. 44; *Rumphius*, iv, t. 104 and 109; Penn., *Pl. Jav.*, t. 8.—*P. grandiflora*, Lindl., in *Gard. Chron.*, 1848, p. 39, fig. 1; *Bot. Mag.*, t. 5184; *Rev. Hort.*, 1850, p. 238, figs. 53, 54.—*Cymbidium amabile*, Koxb., *Fl. Ind.*, iii, p. 457.—*Nepenthes amabile*, L., *Sp. Pl.*, ed. 1, p. 593; *Vin.* in *Encycl. Art. Soc. Sc. Upsala*, vi, p. 67.—*Angrecum album majus*, Rumph. *Herb. Amb.*, vi, p. 99, t. 43.—This is the original *P. amabilis*; but not the plant which now bears that name in gardens. It is also the *P. grandiflora* of Lindley, a much more recent name. It is found in Java, Borneo, and Celebes; also in Amboyna and Buri of the Moluc-

can Islands; generally at low elevations and not very far from the coast. Fortune obtained it in China (his *P.* 58 at Kew, and in the British Museum), also Maingyu in the Malayan peninsula (his *P.* 1613), but in both these places there are strong reasons for believing it to be merely cultivated for ornament. It is constantly distinguished from the following species by its long and narrow lip. The longer leaves is also a good distinguishing character. The following varieties have been described:—

Var. *aurea*.—*P. grandiflora* var. *aurea*, Warner, *Select Orch.*, ser. 2, t. 7.—P. Kuckertii, *Proc. Roy. Hort. Soc. iv*, p. 97.—Front half of lateral lobes of lip, with the entire front lobe, including the horns, stained with deep yellow. Native of Borneo.

Var. *javana*, Rehb. f., in *Bot. Zeit.*, 1862, p. 214.—Lip suffused with a dusky tint. Native of Borneo.

2. *P. Aphrodite*, Rehb. f., in *Otto Hamb. Gartenz.*, 1862, p. 35. *Xen. Orch.*, ii, p. 6.—*P. amabilis*, Lindl. (not Blume), *Bot. Rev.*, 1838, t. 31; *Bot. Mag.*, t. 4397; *Manud. Bot.*, iii, t. 133; *Past. Mag. of Bot.*, vi, t. 49; *Fl. de Serres*, t. 36; *Gard. Chron.*, 1848, p. 30, fig. 2; *Orch. Alb.*, t. 11.—This is the *P. amabilis* of Lindley, and of gardens, but not the original plant described by Blume under that name, which is the *P. grandiflora* of gardens. The confusion was pointed out long ago by Dr. Reichenbach. It is only known from the Philippine Islands, and is readily distinguished from the foregoing species by the shorter and broader lip, also by the shorter and broader leaves. The following have received distinctive names, but seem to me mere forms or varieties of this species rather than natural hybrids:—

P. ambigua, Rehb. f., in *Otto Hamb. Gartenz.*, 1862, p. 35.—Said to have the flowers of this and leaves of the preceding species, and supposed to be a hybrid between the two. It seems to me a mere state of *P. Aphrodite* with leaves somewhat longer than usual, for the supposed parents occupy distinct geographical areas, and we have no evidence that a seedling Phalænopsis had at that time flowered in gardens.

P. casta, Rehb. f., in *Gard. Chron.*, n.s., iii, p. 590.—Leaves thinly spotted; flowers of Aphrodite, with a slight rosy tint, especially at base of petals, also a few spots at the base of lateral sepals. A mere variety, and scarcely distinguishable.

P. leucorrhoda, Rehb. f., in *Gard. Chron.*, n.s., iii, p. 301; *Fl. Mag.*, n.s., t. 166.—Leaves blotched with grey in irregular transverse bands; sepals and petals flushed with rose, sepals yellowish outside; callus of lip yellow with purple spots.

P. leucorrhoda var. *alba*, *Fl. and Pomol.*, 1883, p. 42.—Flowers white with purple spots on lip and base of lateral sepals.

P. Sanderiana, Rehb. f., in *Gard. Chron.*, n.s., xix, p. 656.—Flowers suffused with rose; lip variegated with brown, purple and yellow. Found in the island of Mindanao.

P. Sanderiana var. *marmarota*, Rehb. f., in *Gard. Chron.*, n.s., xx, p. 812.—Flowers magenta-pink plush; sepals and petals yellowish-white outside.

3. *P. Stuartiana*, Rehb. f., in *Gard. Chron.*, xvi, p. 748, also 753, fig. 149; *Bot. Mag.*, t. 6622; *Ill. Hort.*, 1884, t. 540; *Fl. and Pomol.*, 1882, p. 49, t. 559; *Regel. Gartenfl.*, t. 1130; *Orch. Alb.*, t. 39; *Lindleya*, t. 8.—Supposed to be a natural hybrid between *P. Aphrodite* and *P. Schilleriana*. Leaves transversely marbled with greyish brown; flowers white, except lower half of lateral sepals and lip, which are densely spotted with brownish or cinnamon-red. Native of the Philippines. Two slight varieties have received distinctive names.

Var. *Hrubynka*, Rehb. f., in *Gard. Chron.*, n.s., xvi, p. 372.—Sepals and petals purple on back, with white margins.

Var. *punctatissima*, Rehb. f., in *Gard. Chron.*, n.s., xvii, p. 14.—Spots more numerous than usual, and naive in colour.

4. *P. Schilleriana*, Rehb. f., in *Otto Hamb. Gartenz.*, 1861, p. 144; *Gard. Chron.*, 1860, p. 216; *Bot. Zeit.*, 1860, p. 383; *Xen. Orch.*, ii, t. 101; *Fl. Mag.*, n.s., t. 257; *Regel. Gartenflora*, t. 581; *Fl. de Serres*, t. 1559; *Gard. Chron.*, n.s., xii, p. 304, fig. 44; Warner, *Select Orch.*, ser. 3, t. 5; Jennings, *Orch.*, t. 15.—A beautiful species with mottled leaves and rose-coloured flowers. Native of the Philippines. The following varieties have been described:—

Var. *major*, Hook., *Bot. Mag.*, t. 5530.—Flowers large and pale.

Var. *reticulata*, Rehb. f., in *Gard. Chron.*, n.s., xvii, p. 330.—Flowers white.

Var. *innoculata*, Rehb. f., in *Gard. Chron.*, n.s., iii, p. 429.—Flowers rosy without spots. Side lobes of lip white with a violet margin and yellow callus.

5. *P. delicata*, Rehb. f., in *Gard. Chron.*, xvii, p. 700.—I have not seen this, and therefore am doubtful how to regard it, though it can scarcely claim specific rank. Reichenbach says the leaves and roots are like *Aphrodite*, though it has neither the tendrils of that species nor the loricipate teeth of *intermedia*. I suspect it will prove to be a form of *Aphrodite*, with which the sepals and petals are said to agree.

6. *P. intermedia*, Lindl., in *Past. Fl. Gard.*, iii, p. 163, fig. 310.—A natural hybrid between *P. Aphrodite* and *P. rosea*, as originally suspected by Dr. Lindley and now confirmed by its artificial production in the establishment of the Messrs. Veitch. The fact is a most interesting one, as the two are placed in different sections of the genus. Native of the Philippines. Two varieties have been named:—

Var. *Drymeriana*, Rehb. f., in *Gard. Chron.*, n.s., v, p. 366; *Fl. Mag.*, n.s., t. 263.—A richly coloured variety.

Var. *Portei*, Rehb. f., in *Bot. Zeit.*, 1863, p. 128; Warner, *Select Orch.*, ser. ii, t. 2.—*P. Portei*, *Gard. Chron.*, n.s., v, p. 370, fig. 72.—Flowers large, stained with bluish.

7. *P. Vitichiana*, Rehb. f., in *Gard. Chron.*, 1872, p. 935; *Fl. Mag.*, n.s., t. 213.—A very rare plant, for a long time a single individual only being known, and this in the possession of the Messrs. Veitch. It has been surmised to be a natural hybrid between *P. rosea* and *P. Schilleriana*. The sepals and petals are somewhat like the former, but larger, and rosy-lilac in colour. The shape of the lip is unique, it being terminated by two straight sharp teeth. Native of the Philippines.

Var. *brachydonia*, Rehb. f., in *Gard. Chron.*, n.s., xxi, p. 270.—Sepals and petals pure white, lateral sepals with some brown spots near base; lip white, with purple markings.

R. A. Rolfe, Herbarium, Royal Gardens, Kew.
(To be continued.)

THE INDIGENOUS VEGETATION OF AUSTRALIA, WITH SPECIAL REFERENCE TO THE EUCALYPTI.*

The indigenous vegetation of Australia is evergreen. In England it is deciduous—that is, trees that annually lose their leaves.

The fresh green scenery of June over the face of England is ever absent in primitive Australia. The Daisies and Buttercups, Primroses and Cowslips do not deck her pasture lands; neither do her people behold the Mayflower hedges or view the Chestnut leaf, or the glossy dark copper foliage of the Beech. And yet Australian flowers are gay in colour, and the plant life is varied and pleasing. Sandwax and Orchids, wild Pelargoniums and native Fuchsias, and Heath blossoms in almost endless coloured tints, abound in many parts in reckless profusion; and these and many other flowering and foliage plants intermingle their varied hues over the surface of the land. Along the side of the creeks and watercourses may be seen, during many months of the year, the Mimosa trees in full bloom, the tufted bunches hanging like golden balls, and perfuming the air with the sweet scent of the cassie. Even in the forests around evergreen Fern trees grow in luxuriance and beauty under the shade of tall timber trees, where can be seen pretty tiny flowers peeping up between the broken pieces of the fallen shed bark from the Gum trees. Parrots and cockatoos scream their wild notes, wrens and robins and other gay-coloured birds twitter about the scene, and all over reigns a bright sunny sky. These and other tropical and subtropical beauties greatly compensate for the absence of England's native flowers.

But the lively scenery and pretty flowers of Australia are not so much the object of this paper as it is to give some interesting facts of a peculiar vegetation known as the Eucalyptus, which exists and reigns almost supreme over the greater portion of Australia and Tasmania, although entirely absent in the other islands of the South, with the exception of a few species in New Guinea. There can scarcely be a doubt but that at some period of the world's history Tasmania and New Guinea formed a part of Australia; hence the Eucalyptus may be considered as a vegetation purely Australian. Strong evidences exist proving that the Eucalyptus is an ancient Australian vegetation. River beds of great antiquity have been met with, at depths varying from 100 to 200 feet, and even deeper, in various alluvial gold mining districts of Victoria, revealing occasionally massive timber trees without any sign of decay, belonging to the family of the Eucalyptus, chiefly those of the Red Gum (*rostrata*) and the Ironbark (*Leucocoryn*) species. Some species growing at the present day on the alluvial flats, mountainous ranges, and in the valleys, attain a prodigious size, both as to girth and

* Lecture delivered in the Conference room at the Colonial and Indian Exhibition, Monday, June 22, by Joseph Bosisto, M.P., J.P., President of the Royal Commission for Victoria.

THE ROCK GARDENS AT STANCLIFFE

height, bespeaking their longevity, possibly contemporaneous with the Cedars of Lebanon. The word "Eucalyptus," from *eu*, "well," and *kalypto*, "to cover," is aptly chosen to distinguish this splendid family of plants from all others. This characteristic is observable in the limb of the calyx completely covering the flower before expansion; and during its gradual development the operculum, or lid, is uplifted in shape like an extinguisher, which falls off immediately the flower becomes matured. The chief characters of all Eucalypts are in the firmness of the calyx, the absence of petals,

In the vegetable kingdom the Eucalypts belong to the Myrtle family, so placed on account of their bearing certain botanical outlines similar to those of the garden Myrtle of England; but the physical characters, as well as some peculiar botanical features of the Eucalypts, place them as a distinct genus in the Myrtle family of plants. Considering the vast area of the Australian continent, consisting of something over 3,000,000 of square miles, and measuring 2500 miles from west to east, and 2000 miles from north to south, it is surprising to find one tribe of trees forming at the present day four-fifths of the whole of

branch, the top being capped with radiating branches (like the ribs of an umbrella) full of foliage.

On the undulating lands, although bearing many Acacias and a variety of other kinds of trees, the prevailing feature is the Eucalyptus; no matter where the traveller journeys this vegetation is generally present.

Throughout Australia it may be viewed as a firm friend to man and beast. To the cattle depasturing, and to the tens of thousands of sheep grazing over the pasture lands of the country, it gives shelter from the midday sun and from dewy night. The wandering swagsman, or the travelling bushman, reaching no homestead at sundown, finds rest under its wide-spreading branches, and often shelter within some patriarchal Gum tree, which, although standing firm and erect, has become through old age hollow in the centre, sufficient to give him, or even half-a-dozen other persons, a comfortable rest-house for the night. To many of the early pioneers of Australia have these trees given a nightly home, and many a meal of damper and mutton, and many a pipe of peace have been partaken inside their cavernous recesses.

In the scant rain tracts of Australia there are many millions of acres on which grow a scrub of dwarf Eucalypti, averaging in height not more than 8 feet; this scrub is so dense that it almost shuts out the sight of sun and sky. Once an untutored traveller loses the track, and gets entangled but a small distance in this forest of sticks and leaves, the chances are that he never returns either to kith or kin again. Many persons travelling through this country have died for the want of water, and yet there is always a supply sufficient to sustain life close at hand, did they but know it; for in one kind of this dwarf vegetation there is lodged in the stem about half a pint of pure water. As a bushman generally carries a tin pannikin and a small tomahawk, he has nothing to do but to cut down one of these stick-like stems and place the lower end of it into this vessel, when he will in a short time obtain water. This strange tract of country I have traversed; there is not a sound of life to break the solemn silence, scarce a bird to be seen, and not a stone or a pebble to be obtained the size of a marble; a few dingoes or wild dogs prowls about here and there at night. Native wells scattered far apart over an area extending some thousands of square miles are to be met with, but they are more frequently found dried up than otherwise; and yet the soil in many parts is well adapted for Wheat growing; it is a mixture of sand, decomposed ironstone and vegetation, with a substratum of limestone. Weird is the scene; still the vegetation found growing jungle-like over these lands contains health principles both for climate and for suffering humanity.

The Government of Victoria is, I am happy to say, fully alive to the advantages of irrigation. Only in last Saturday's London papers appears a cable message from Melbourne, stating that the Hon. Alfred Deakin, Chief Secretary, has introduced a Bill in the House of Assembly providing for a system of irrigation embracing an area of 3,250,000 acres, to be carried out under the management of the Water Trust, but vesting the supreme control of the works in the Government. The system is expected to prove of immense benefit to farming interests. The expense is estimated at £3,800,000.

It is the Eucalyptus which has given character to Australia, both in climate and in the health and comfort of her people. From the heavily timbered Eucalyptus forests down to the scrub I have just mentioned, every variety of wood is obtainable, whether it be for ship or house building, or for docks, or bridges, for carriages or waggons, for land fencing or garden ornamentation, or for fuel, its variety is unbounded and its durability is in many cases equal to its longevity. In the several Australian courts the timber trophies consist chiefly of the many species of the Eucalyptus, or, as they are termed in Australia, Gum trees; and an examination of these will satisfy any person that I have not exaggerated the timber value of these trees.

Although the leading forest timbers of Australia consist of the Eucalyptus, yet there are a variety of other kinds. In the Eucalyptus the wood varies in character quite as much as do other kinds obtainable from other timber trees. For instance, the well-known Blue Gum (*E. globulus*) is a hard light-coloured timber of great strength and tenacity, as well as durability, extensively used for beams and joists in buildings and for railway sleepers, also piers and bridges. A comparative test has been made between some Blue Gum, English Oak, and Indian Teak,

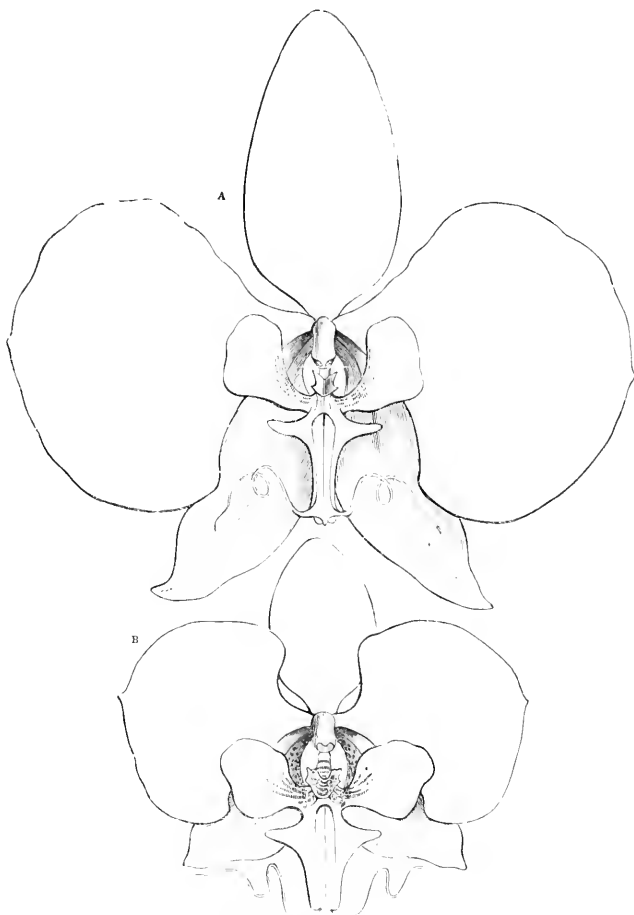

FIG. 43.—A, PHALENOPSIS AMABILIS, *Blume*, = *GRANDIFLORA*, *Lindley*; B, PHALENOPSIS APPRODITE = *AMABILIS*, *Lindley*, not of *Blume*. (SEE P. 212)

the numerous rows of stamens inserted close to the edge of the calyx tube, the stamens being nearly always fertile, and also the many form variations of the anthers in the different species. This systematic arrangement was made by the late venerable Bentham, and acquiesced in by our Government botanist, Baron von Mueller, as being the wisest to adopt.

The Eucalyptus is an evergreen. It casts its bark annually; but this does not take place, like the falling leaf of England, at one given period of the year, hence there is always a rough and ragged appearance on the trunk of the tree. In those pictures in the Victoria Court which depict Australian bush scenery this is to be noticed, and is not therefore the fault of the painter, as some persons have imagined.

the indigenous vegetation. An Australian traveller frequently feels the monotony of the scenery; but this is greatly dispelled by noticing the interesting variations in the leaf formation, in the colour both of leaf and flower, in the appearances of the tree-bark, and in the shape and varied stature of the trees.

Of the 150 kinds or species found existing over Australia, it can easily be understood that the variations must be very great indeed.

On the mountains and in the valleys, and on alluvial flats where the woodman's axe is but seldom heard, stand gigantic Eucalyptus timber trees, in girth varying from 16 feet to 80 feet, and in height from 200 feet to 420 feet, and that often without a

The Blue Gum carried 14 lb. weight more than the Oak, and 17½ lb. more than the Teak per square inch.

The Red Gum tree (*E. rostrata*) is a very hard compact wood, possessing a handsome curled but short grain, red in colour, well adapted for many purposes in ship-building, such as heavy framing, beams, and knees; it is also used in the construction of culverts, bridges, and wharves, and by wheelwrights for the felloes of heavy wheels, and is employed in Australia for railway sleepers and engine buffers. Owing to an acid it contains, termed "eucalyptic acid," it resists the attack of the Teredo navalis, or sea-worm. The Iron-bark Gum tree is one of the hardest and heaviest of our native woods.

The Stringy-bark tree (*E. obliqua*) is an easy splitting wood, and is usually employed for palings, shingles, and posts. In like manner do all the varieties change. Many varieties of Tree Acacias are met with in all the forests of Australia, such as the Myall and the Watties, also Pines, Banksias, Casuarinas, Pittosporums, Eugénias, Melaleucas, and others too numerous to mention.

It is to be deplored that just now the country is being subjected to a wasteful destruction of many kinds of the Eucalyptus. Some of the varieties in various districts are totally disappearing, and without some determined and immediate action on the part of the Governments of Australia, but few decades will pass before a timber dearth sets in.

The subject of forestry has attracted the attention of most countries of the world; even in Australia botanists, builders, contractors and legislators have uttered a warning voice. The lands of Australia at present are full of the seed of timber trees; the selectors of our lands know this right well. Let them but neglect to cultivate their farms for a season or two, they find them covered with a growth of young timber plants consisting of the Eucalyptus and Acacias; but tree seed, although covered with an epicarp in order to protect the germ from an early loss of life, yet cannot retain their power of germination for many years when the lands are kept under cultivation. Vegetation aids materially in equalising the temperature and climate of a country. There can be no doubt that the climate of Australia, speaking in general terms, is not so hot as it was forty years ago. The modification is produced by cultivation and the opening up of lands which formerly were covered with dense forests, tangled bushes, Ferns, climbing plants, lichens and mosses. But the climate of an extended area like Australia cannot be dealt with in one general statement. The highest mountain is less than 10,000 feet high, and few exceed 6500 feet in height. Majestic alpine chains of ranges stretch through many parts. The snow line of Australia is less in altitude than most other countries, arising probably from the cold antarctic winds receiving their first break on these bleak mountain ranges. Aerial, oceanic and terrestrial magnetic currents produce many changes over so vast a continent. The rainfall of Australia varies considerably in many parts: in the hill districts approximately it may be stated to be 50 inches per annum; in the undulating woodland districts, from 30 to 50 inches; on the adjoining plains 20 inches; over the wide expansive plains away from mountains or hills, from 5 to 15 inches; while farther on into the interior, rain has been known to be absent for two or three years together. All these things affect climate, but there is nothing in the physical features of Australia to promote miasma. Its lagoons and swamps are not extensive; most of them are dry during the summer months; and even where they remain otherwise there are surroundings of a healthy character, especially the tan barks and leaves of the Eucalyptus, which fall in, obviating thereby any ill effect.

The physical geography of Australia does not differ in its general outline from that of other countries. The first Victorian geologist—now Professor Selwyn, the Government geologist of Canada—reported that: "In general structure, character, and composition in geological sequence, and in physical and palaeontological relations, the rock formations are in all respects analogous to those of other regions." But there is a factor at work throughout Australia which makes the climate so perceptible to human life, and that is the Eucalyptus vegetation, belonging, as I have before intimated, to the Myrtle family of plants. It is full of aromatising odours. The sense of smell when in our forests, or even travelling in the country,

bears ample testimony to the presence of its volatile bodies in the air, for there is no mistaking the odour, as it is different from all others. There is not a single species but what possesses in its leaves a volatile essence; each kind varies in percentage of yield; but still of the vast number they can be reduced for practical illustration under eight types, or species, namely:—

- The Viminalis, or Manna yielding Eucalyptus.
- The Olorata, or sweet smelling.
- The Rostrata, or Red Gum tree.
- The Obliqua, or Stringy-bark.
- The Leucocylon, or Iron-bark.
- The Glolulus, or Blue Gum.
- The Dumosa, or Mallee.
- The Amygdalina, or peppermint-scented Eucalyptus.

The eight kinds I have mentioned supply the minimum to the maximum; the minimum yielding seven fluid ounces of the volatile essence, and the maximum 500 fluid ounces, or twenty-five imperial pints from every 1000 pounds weight of fresh leaves. No vegetation occupying so vast a country contains so much volatile odour in its leaf portion as the Eucalyptus. Assessing alone the whole colony of Victoria (being that part of Australia in which most of my experiments were made) at the low average of supply of 20 ounces, or one pint to the acre, we have 9,730,500 gallons of an essential and volatile substance held at one and the same time in the Eucalyptus vegetation.

So far as I have been able to proceed in this investigation over the continent of Australia, similar conditions exist; so that it may be safely asserted that in the whole of the leaf surface of the Eucalyptus in Australia there is continually 99,877,440,000 gallons of this volatile material. If, therefore, the whole of the odorous principles were retained in the leaves until set free by the art of man, in that case its effect on climate would fail; but if they are given up freely by the natural forces of the tree under the aid of light, heat, or electricity as existing around, or by some or all of these forces in combination, then we have good reason to value the Eucalyptus vegetation beyond all others in being capable of influencing the climate of a country for purposes of health. Leaves of trees necessarily are in close connection with the roots; together they keep up a continuous action of exhalation and replenishment. Evergreen trees, especially the Eucalyptus, unlike deciduous trees which sleep during many months of the year, work constantly, though at times less energetically. Deciduous leaves generally perform their functions on one side only, that is, they change the sap juices of the plant on the side turned upward to the sun; but in the case of the Eucalyptus it is quite different, these have a double action. There is no difference in the anatomy of the two sides of the leaf; breathing pores abound on each side, and the cells containing the volatile oil run through the leaf. These oil cells in most cases are visible to the naked eye, and can be counted in hundreds. Light and warmth operate alike on both sides of the leaf; each being suspended in a line with the axis of the tree, giving facility for the remarkable and interesting movement of the petiole or leaf-stalk, which is continuous in its action under the warm currents of the air, or the direct rays of the sun, keeping one side of the leaf's surface to face the sun or the warm air current, and so establishing perpetual leaf operation. Now it is by the natural forces of the tree and the leaf action acting in unison that the watery and odorous bodies are continually set free in the air, and in such minute and diffusive atoms that they may be expressed as the fragrant breath of the tree, requiring as it does thousands of its compound particles to form a single drop. Under such circumstances these odorous bodies speedily change their molecular condition, and supply to the atmosphere an extra amount of active oxygen; it is this unceasing health factor throughout Australia which makes its climate, on the whole, the finest in the world.

OBSERVATIONS ON THE THERMAL CONSTANT OF VEGETATION.—Prof. H. Hoffmann, communicating the result of the most recent observations on the thermal constant of vegetation, compares the figures for a number of plants for Uprala and Giessen, and concludes that the results agree quite as closely as can be expected, showing that there is no change in the constant depending on latitude or climate. (*D. M. Z.*, i, p. 407.)

HOME CORRESPONDENCE.

Potato Species.—I am very pleased to find it is now admitted that *Solanum Maglia* is the true *S. tuberosum* or parent of our garden Potato. When I saw *S. Maglia* growing at Mr. Fenn's place last year I felt then that it must have been the progenitor of our Potatos; and it is remarkable how little, comparatively, so far as top growth is concerned, its progeny has deviated from it. It is true we have dwarf kinds and tall kinds, and much variation in leafage, but still, through all the type remains the same. Specially it is so in the features to which you refer, viz., flowers and calyx-sheaths. I have examined myriads of flowers not merely of named varieties but also of seedlings, and have found variations in length of the calyx-lobes, some being quite half an inch long, and very much reflexed; others arc, perhaps, not half so long, and very diminutive, but still are pointed, not a single obtuse one being found. A pleasing study might be made of the variations in colour found in flowers, and really many are beautiful, but colour of bloom gives no indication of the colour of the tubers beneath; even seedlings which have tops almost black in colour have flowers of the whitest. For a long time yet the Potato will afford interesting study. *A. D.*

Temperature, Vegetation, &c., in the Botanic Garden, Glasgow, for June and July, 1886.—The lowest temperature registered during the month of June was 36° during the nights of the 21 and 20 h respectively. The highest day temperatures in the shade was 72° on the 13 h, and 71° on the 20 h, 29 h, and 30 h. On the same dates the temperature in the sun varied from 100° to 107°. Collectively the maximum and minimum temperatures correspond closely with those recorded for June last year. On the whole the weather has been cool and dry. Vegetation is suffering much for want of rain, growth being stunted, and many plants forced to bloom prematurely. Hardy trees and shrubs have not bloomed well this year, which is attributable to the unfavourable amount of last year. During the month of July the weather has been variable, and often very cold for the season. The highest day temperature in the shade was 75°, on the 1st and 2d, and 71° on the 1st, 3d, and 21st respectively. The lowest day reading was 58°, on the 29th. During the nights of the 26th and 27th the mercury fell to 38° and 37°, the thermometer at the time being sheltered by the foliage of large trees. A few m-ls east from here the freezing point was touched, single Dahlias being perceptibly affected. Although rain has fallen frequently since the early part of the month, the showers have been light, especially so compared with the rainfall in many parts of the country. Such weather has been conducive to the growth of both hardy and half-hardy plants; the blooming properties of the latter having been well developed during the hot, dry days which prevailed at the end of last and early part of the present month, a fine display has been the result. Owing to want of the sines of war few annuals have been sown this year, and those of the commonest kinds; both these and many hardy herbaceous plants are from two to three weeks later in bloom than usual. *R. Dutton, Curator.*

Corydalis lutea.—During such a trying hot season as was recently experienced here there was an opportunity to observe any species of plants which root too superficially, or are too fragile to withstand the severe test of extreme aridity and bright sunny weather. Any hardy plant being a fitting subject for herbaceous borders which will withstand these conditions of our life and still keep on blooming and remain in perfect health, must therefore be invaluable. I write least of all for expensively prepared, mulched, and watered borders, but rather for the many who can give only ordinary attention, and who are by far the more numerous. No ordinary herbaceous border should be without an admixture of *Fumeworts*, and our native yellow variety more especially. *Corydalis lutea*, with glaucous foliage, resembling a Maidenhair, will grow upon the top of sides of walls, and it never seems to suffer in any position, growing generally in deep rich soil, and has a longevity second to none. *William Earley.*

Bees.—The recent exhibition at South Kensington by the British Bee keepers' Association, apart from its many other interesting and useful aspects, claimed some little notice at the hands of horticulturists. A little interest was imparted to the show by a display of bee flowers arranged amongst the exhibits, such, for instance, as Lavender, *Solidago* (*Golden Rod*), *Veronica*, *Honeysuckles* (very appropriately named), *Cliver*, *Hyssop*, &c. I think there were no aesthetic exhibitors, or examples of the *Smilacina*—a favourite with the bees—would have been exhibited. Those learned in bee flowers might at convenience

contribute to your columns, with the Editor's permission, a complete list of those favoured by this extraordinary trial; a further degree of interest would attach to such by its being noted where this has been observed, the colours of the flowers that are most visited, this, doubtless, playing an important part in "improving the shining hour." B.

Centaurea macrocephala (see p. 168, in last issue).—To use an Hibernicism, you have anticipated the precaution. I have had served at table east of Marseilles, several times, the above in place of *Cynara scolymus*. The change is not desirable. S. A.

A Giant Fungus.—I have sent you a fungus which I found growing in the garden this morning. Being one of the largest I have seen, I thought it would be worth sending. You perhaps have seen larger specimens. *W. Byron, Thorpe Lee Garden, Egham, Surrey.* [The fungus is the Giant Puffball (*Lycoperdon giganteum*). It develops with extreme rapidity, and is perfectly wholesome if eaten whilst still snow-white. It should be eaten in pieces as tried, when it will be found to be delicious; care must, however, be taken to eat it only so long as it is snow-white. ED.]

Pea Telephone.—I am sadly disappointed in this Pea; many of the blossoms shrivelled up and never developed into pods, and the haulm curled up and did not grow, both of which may have been owing to the great heat we had in July; but that is a serious objection if it is the case. For beside it, under the same conditions, Dickson's Favorite, Huntington and Champion of England have all done splendidly, while *Ne Plus Ultra* is all that can be desired and generally holds out till the end of October. Many of the new Peas are admirably adapted for the exhibition tent, but my advice to beginners is, prove them by the side of older varieties before you go in for them exclusively. *W. Rust, Eridge Castle.*

On the Origin of the Pink.—For the information of "R. D." and others, I may say that the first Pink worthy of notice was raised in the year 1772 by Mr. James Major, who was then gardener to the Duchess of Lancaster, previous to which there were but four sorts, and those of very little note, being cultivated only for common border flowers. This variety was sent out the ensuing year to the public under the name Major's Duchess of Lancaster, at 6s. 6d. per pair, the orders for which amounted to the sum of £80. One order to a single individual of forty pairs was delivered at the above price. Lady Sowerble, referred to by "R. D.," was a seedling from Duchess of Lancaster. Mr. Major lived many years in the parish of Lewisham, Kent, and died on March 18, 1831, at the advanced age of ninety-four years. *North Norfolk.*

The Potato Crop in the South of Ireland.—This is still—some say "unfortunately"—one of the staple crops in this country, and though the produce may be generally less than last year, on the whole at present it promises fairer. The prospect at the end of June is not so red as that of the corresponding land, which always retains sufficient moisture, was by no means reassuring. I always manage to have some fit to use on a warm southern border about June 12, giving the preference for quality to Myatt's Ashleaf and Carter's First Crop. If I were a market gardener, and quantity and size were the objects in view, I should sow, first, Beauty of Hebron, then Early Rose (a week earlier), then Vicar of Leham—having cropper and early, and Flounder. This last is seemingly not yet noticed, and I never see it referred to in any list that comes under my notice, but it is largely grown in three-fourths of Ireland. It is very early, and gives a heavy return in rich deep loams, and in a season such as this, when the crop is wholly disposed of before blight appears, should be most profitable. We still grow it largely, and though most liable to it, is still free from disease—a subject of vital importance to this country, and on which I shall say a word before concluding. I have had two varieties for the first time this season—"Cetewayo," one of the blackest kidneys in commerce. The flesh when cooked is purple, and except being of an irregular kidney shape, reminded me of the old Sherry Blue I used to grow when I had charge of Potato experiments at the Government Farming Institute at Glasnevin a quarter of a century since. It is likely to be largely grown as a curiosity. The other, appropriately named Village Blacksmith, is a distinct addition to the dark-skinned and white-fleshed round class. The skin is netted, but not so as to produce much waste, while the flavour is most desirable. Both ripened early, perhaps prematurely, owing to June being unusually dry and warm here. What has become of that fine garden variety, Extra Early Vermont? This season should suit it admirably. But some one may be disposed to widen the query, and ask, "What becomes, in a short time, of all the American introduced varieties? Evidently, coming from a warmer

and drier climate, they rapidly degenerate and become deficient in quality—then pass out of cultivation; the Peronospora arising their exit. At the time referred to I had the crying out of some Potato experiments at Glasnevin, by direction of Prince Albert, who visited there, and of thirty American varieties, many of them then well known, not one is now in common use. Evidently the proper course is to raise new varieties that can be tested before going into commerce at home. This seems to be the view taken by the Commissioners of National Education in Ireland when offering prizes to their teachers last year for amounting to £100, and which were referred to at length in the *Gardeners' Chronicle* last autumn. Whether judging by appearances will determine also quality remains to be seen. My field Potatoes are principally Magnum Bonum and Champions, with smaller quantities of Heros, Scottish Queen, Adirondack, Kemp's, and a Potato that should be better known in this country, Cosmopolitan. Fortunately I had them sown and I moulded before the drought set in, otherwise they would be much smaller than they promise to be. Never at this time of the year I am satisfied did the general crop look more promising. The drought in the South of England being much more prolonged than here, they suffered much more than we did. Great blessing and boon as the Champion has been to Ireland, there is no denying it is slowly degenerating. Some imported, as I did, several tons from Dorsetshire, and they are by no means so robust as say, four or five years since, and this is general. From being 3 feet high, stalks and not a row half that, and so on. There is, however, one subject of general congratulation, that I am sure you will be pleased to hear—there is no Potato disease in Ireland so far, and this means millions on the creditor side, and, more than that, it means plenty to the Irish peasant—for all—for human beings, the farm animals if necessary, pigs, fowls—everything: much more than you can realise in England. I have seen the potato crop ruined by disease. We are now a month later than when I first wrote, and the flow of the haulm is so matured it can do no harm even if it comes. *W. J. Murphy, Comel.*

Tomato Sutton's Main Crop.—This variety, with very strong, greyish-green foliage, is an immense cropper out-of-doors. The fruits are almost smooth, and globular in shape, of great solidity, and a rich scarlet colour. It ripens readily in the open quarter. *M.*

Spiranthes Romanzoviana is now well in flower, thanks to the courtesy of Mr. Gumbelton, who last season kindly forwarded me living specimens of this rare and interesting native Orchid. Save in one or two stations in the County Cork this plant has, so far as is at present known, been found wild in no other part of Europe, its nearest stations being a few of the cold upland bogs of North America. I have been always puzzled how to reconcile home drawings of this Orchid with those sent me from America, the two plants appearing as diverse in foliage and flower arrangement as might well be. Now, however, that the genuine Cork specimens are in full flower I must admit that the American drawings are infinitely more correct—at least, represent the plant as I now have it—than those executed in this country. The creamy-white, sweetly scented (Violet) flowers are spirally arranged in three rows, with the sepals and petals forming a close hood over the lip. It is known as *S. Iliroica* in the South of Ireland. *A. D. Webster.*

Rose Prince Arthur.—This Rose, which was sent out without any ostentation by the Cranston Nursery Co., has been blooming in very vigorous style in the same nurseries. The colour is a glowing dark crimson, and the form in every stage good, notwithstanding the looseness of the outer petals. A Rose which is truly perpetual in blooming like this, and is at the same time so attractive, ought not to be missing from the gardens of your readers. *Zi Tzaganolis.*

Annuals.—Why do not gardeners more commonly grow *Erysimum Peroffkianum* as a yellow flowering plant for groups in the border and for small beds? The colour is a pure lemon-yellow, the flowers resembling at a distance those of the Wallflower. It grows readily, and only dislikes shade. *Eschscholtzia Rose Cardinal*, is another pretty annual, better than Mandarin, which has not made its way in gardens as was predicted of it. *Helianthus minimus* is a fine dwarf miniature Sunflower, of a very free flowering habit and of the easiest culture. It blooms all through the summer and autumn till cut down by frost. *Nasturtium Cloth of Gold*, is a dwarf variety that does not flower well, but is desirable for its pale yellow foliage, its height is ½ foot. *Trachelium pænum*; is a charming variety, of climbing habit, with flowers of sulphur-yellow and light rose. *Visitor.*

Epipactis ovata.—This dwarf-growing early flowering Hellebore has never bloomed so well

under cultivation as this season. The flowers are pinky-purple, in a short raceme, and produced about a month before the broad-leaved form—*E. latifolia*. By some botanists this plant is reckoned as but a form of *E. latifolia*, but the groups of flowers are widely different, the method of increase different, too, and the time of flowering and height of the plants more different still. *A. D. W.*

Reports of Societies.

ROYAL HORTICULTURAL: August 10.

QUITE an extensive show of flowering plants and cut flowers were exhibited on this occasion at South Kensington. Foremost amongst the objects shown which deserve notice were Roses, cut blooms, of Messrs. W. Paul & Son, Cheshunt; and Messrs. Paul & Son, Waltham Cross; the Gladioli from Messrs. Kelway & Son, and the fine display of hardy Begonias, shown by Mr. Ware, Tottenham. Fuchsias, Begonias, Asters, &c., were shown for competition, as were also vegetables in collection, and the one named (Fuchsias), nothing good may be said, shows examples having rarely appeared at these shows, whereas the Begonias were noticeable for their excellence. The Aster competition was poorly responded to, and but very few good examples were observed. A group of Orchids and a few novelties gave additional interest to the meeting.

Floral Committee.

Present: G. F. Wilson, Esq., F.R.S., in the chair; Messrs. J. Lang, H. Cannell, Shirley Hibberd, H. Herbst, J. Douglas, H. Bantyne, C. Noble, I. Dornay, H. M. Pollett, J. O'Brien, A. J. Lundy, E. Hill, H. Turner, W. Holmes, J. Walker, Amos Ferry, and Dr. M. T. Masters.

COMPETING CLASSES.

3s. Fuchsias, distinct.—The 1st prize fell to Mr. J. Busch, gr. to A. S. Price, Esq., Purkiss, Exwell, the plant being under 3 feet in height, healthy, and full of flower; 2d, H. W. Segats, Esq., Epsom; 3d, H. Lodge, Herne Hill, mostly standard, aged, and not ornamental in a high degree; 4d, Mr. E. Cook, 26, Queensbury Mews East, South Kensington, the plants ranging from 2 feet to 6 feet in height.

Twelve *Pæony*-based Asters.—1st, Mrs. Gilson, Saffron Walden (gr., Mr. W. Archer), with blooms pretty as to colour, regular in form, and in sufficient variety; 2d, Major Scott, Wray Park, Reigate (gr., Mr. J. Morgan), with smaller flowers; 3d, A. S. Price, Esq.

Group of Tuberoses Begonias.—In this class Messrs. J. Lang & Co. were the only exhibitors, a splendid bank being shown in flower, and the plants were composed of plants of a large size, covered with enormous blooms, and chiefly of shades of scarlet, the few plants with yellow flowers of various tints distributed at intervals showing well by contrast. Some of the double-flowered plants, presumably from the open ground, resembled in their doubleness *Turban Ranunculus*.

Nine Begonias, tuberoses, distinct.—Of these there were six lots exhibited, well flowered and grown, the prizes going, irrespective of size, to the newest varieties, 1st, Nor E. Saunders, Fairlaw, Wimbledon Common, the plants bearing very large flowers, and congested shades of scarlet, cerise, &c.; 2d, W. N. Cheesman, The Hill, Dulwich—bushy plants, furnished well with flowers and foliage; 3d, H. Little, Esq., The Barons, Twickenham (gr., Mr. Hill)—nice plants of Messrs. Lang's strain, 4d, Mrs. G. W. G. (gr., Mr. Hill), the plants were taken by H. W. Segats, Esq., with plants showing good and bad forms of foliage and flowers, but fairly well bloomed; the 2d and 3d were taken by Mr. C. J. White, Gleanhurst, Esher, and by W. N. Cheesman, Esq.

Messrs. Paul & Son, Waltham Cross, showed an admirable collection of Roses, consisting of twelve varieties of cut blooms of Teas, and fifteen boxes of H.P., the individual blooms being generally as perfect and as fresh as those shown earlier in the season, especially attractive being the following varieties of Teas—*Pericles Jardins*, *Homer*, *Madame de Watteville*, *Clendinning de Zuzia d'Arc*, *Marie Van Houtte*. A Silver-gilt Medal was awarded.

Messrs. Paul & Son, The Old Nurseries, Cheshunt, showed a collection of fourteen boxes of Roses, as fresh looking and charming as could be desired; besides these, were numerous hardy flowers shown in the cut state, consisting largely of Phloxes, Potentillas, Erythroniums, and other Composites. A Silver-gilt Bankian Medal was awarded.

Messrs. Vilmorin-Andrieux & Co., Paris, exhibited collections of Blooms of Zinnias, Petunias, Liliputian Asters, and Balsams: foremost for novel colouring amongst the first-named, a dwarf strain was shown, flaked and sometimes marked in sections, resembling in this way spotted Carnations. The markings are remarkable, and are said to be pretty constant. A strain of large-flowered Zinnia elegans, of beautiful colours, some of them being of a large size; *Camellia*-flowered Balsams, double flowered Petunias and *Gaillardia Loreoziana* in variety. A

Dianthus chinensis, Black Prince, with black-brownish-purple flower, was shown, the colour of the semi-double flowers being very remarkable.

Mr. C. Turner, Slough, showed *Picotee Duches*, an immense bloom, with yellow ground and scarlet edges.

A tuberos *Begonia*, with immense flowers, single, of a lovely shade of crimson, was shown by Mr. R. Owen, nurseryman, Maidenhead.

Mr. Miles, Victoria Nursery, Brighton, showed a large yellow *Chrysanthemum*, of the early Anemone-flowered section, most unusual in the when *Roses* and *Picotees* are shown at the same time.

Mr. E. H. Krehage, Haarlem, sent some of his seedlings of the new race of hardy *Gladioli*, Nos. 4, 15, 18, and 24 being of pleasing colours.

Mr. Chater, nurseries, Cambridge, exhibited a stand of blooms of *Hollyhock*, which were yellow, well built flower, being considered the best.

Herr E. Benary, seed grower, Erfurt, showed *Aster* rose, dark scarlet, a perfectly new colour, very distinct; the flower is of medium size, incurved, with flat petals.

Messrs. H. Cannell & Sons, Swanley, exhibited a stand of blooms of *Verbenas*, the eyed flowers amongst them being fine for beds or pots; *Lobelia Fascination*, a dark flower with a white eye and a number of Swanley seedling *Begonia* blooms.

Messrs. J. Carter & Co., High Holborn, showed their strain of double *Petunias*, amongst them the double blue self, which, if the foliage be not too soft, should make a splendid bedding variety.

Mr. J. Blundell, Martell Road, West Dulwich, showed four stands of *Hollyhock* blooms of so great excellence that three of them received Certificates, viz. *Prince of Wales*, cerise, very full without guard petals; *Shirley Hibberd*, a crimson, large and full with guard petals distinct and prominent—the colour is of a pleasing shade; *Primrose Gem*, a primrose-yellow, of medium size and good form.

Messrs. Kelway & Sons, Langport, Somerset, put up the finest stand which has been seen at the Royal Horticultural Society's shows, and of which only a few received First-class Certificates, viz. *Sir Cunliffe Owen*, pink and yellow, a fine new colour, long spike and large flowers; *Lord R. Churchill*, cerise, with a white stripe on each segment; *White Star*, white, with a white stripe and deep crimson, purplish in the throat, the segments flamed with dark crimson; *Clarence*, of maroon stripes on a crimson colour, and of velvety texture—a very fine flower. Other superior spikes were *Sir M. H. Beach*, a very handsome cherry-red flower; *Countess Onslow*, an opaque white with a purplish rose flare; *Lord Halsbury*, a brilliant cerise, with white throat and stripes. The total number of spikes shown was 200. A Silver-gilt Banksian Medal was awarded.

The New Plant and Bulb Company showed a collection of *Lilium auratum* as cut blooms, and a tall *Vallota purpurea* magnificent; and from the Royal Horticultural Society's Garden, Chiswick, were brought specimens of East Indian Cotton plants furnished with ripe seed-pods; a plant of *Fuchsia triphylla*, with small dark green foliage, veined crimson and orange-scarlet, constricted tubular blossoms, which are terminal, as in *F. corymbosa*; and *Carnation Chiswick Red*, a useful bouquet variety.

Messrs. Webb & Brand, Saffron Walden, showed cut blooms of *Hollyhocks*, the quality of which was very good; *Crimson Queen*, a full regularly formed flower, of a dark crimson colour, was considered to be the best.

Mr. J. Douglas, Great Geanies, showed *Annie Douglas*, a yellow ground *Picotee*, large, and with plenty of petals to make a full flower; *P. Alnira*, a pure lemon-yellow variety, with a rose white edge, good form, and of a large size.

A plant of *Beaforitia splendens* in flower came from Messrs. H. Low, Clapton Nurseries; the *Callistemon*-like flower is vivid scarlet, and the foliage resembles that of a *Diosma*.

Mr. J. Measures, Esq., Cambridge Lodge, Camberwell, showed a group of *Orchids* in considerable variety, amongst which were observed several *Oncidium* [ones] with good spikes; *Aerides* viridens spatulata; *A. odoratum*, grown without fire-heat, the plant healthy and plentifully furnished with short spikes; *Odontoglossum mirandum* &c.; also *Cattleya velutina*, a pretty species; *Trichopilia luteo-purpurea*, sepals green, very brown, and the tube dark red; and *Cypripedium Lawrenceanum atro-purpureum*, a tall stalked dark form of this variety.

Mr. W. Bull, New Plant Nursery, Chelsea, exhibited *Impatiens Hawkeri*, well bloomed specimens; *Miltonia spectabilis bicolor*, the lip very large comparatively and the purplish bloom at the base occupying half the area; it makes a distinct and pretty addition to the genus. *Cattleya Schofieldiana* was likewise shown. A group of the *Cienkowski* *Kirki* was also shown in flower.

Mr. T. S. Ware, Hall Farm, Tottenham, had a magnificent display of hardy flowers, in which *Papaver nudicaule*, *Hyacinthus canalicatus*, *Lilies*, *Gladioli*, *Trionias*, *Harpaclitum*, and *Picotees* were the showiest subjects. A rarity was shown from this nursery in *Spirax pulcherrima*, a tall Red-like species, 4 feet in height, with flower-racemes of 1 foot in length; the flowers are pendulous campanulate, of a rosy-red colour.

Olearia Haasii was shown in quantity in pots, the plants being covered with its dense masses of white flowers.

FIRST-CLASS CERTIFICATES.

To Messrs. Kelway & Sons, for *Gladiolus Lord Salisbury*.

To Messrs. Kelway & Sons, for *Gladiolus Clarence*.

To Messrs. Kelway & Sons, for *Gladiolus Sir Cunliffe Owen*.

To Mr. Blundell, for *Hollyhock Princess of Wales*.

To Messrs. Webb & Brand, for *Hollyhock Crimson Queen*.

To Messrs. Webb & Brand, for *Hollyhock Primrose Gem*.

Mr. G. Mills, for *Chrysanthemum* (early) Mrs. Burrell.

To Mr. W. Bull, for *Miltonia spectabilis bicolor*.

To Mr. Phillips, for *Adiantum cuneatum*, Phillips var.

To Mr. Blundell, for *Hollyhock Mr. Shirley Hibberd*.

To Messrs. Vilmorin-Andrieux & Co., for *Zinnia elegans*, dwarf striped strain.

To Messrs. Vilmorin-Andrieux & Co., for *Dianthus* (chinensis) *Black Prince*.

To Mr. Chater, for *Hollyhock Revival*.

To Mr. C. Turner, for *Picotee Duches*.

To Mr. T. S. Ware, for single *Dahlia Squire Gamble*.

To the Society's Garden, Chiswick, for *Fuchsia triphylla*.

To Mr. R. Owen, for *Begonia Imperial*.

To Mr. E. Benary, for *Aster Rose*, dark scarlet.

To Mr. Douglas, for yellow *Picotees Annie Douglas* and *Alnira*.

Fruit Committee.

Present: Dr. Hogg in the chair; Messrs. H. Wier, J. Woodbridge, W. Warren, C. Ross, G. T. Miles, J. Hillam, G. Norman, P. Crowley, G. Silverlock, D. Blackmore, G. Bunyard, J. Smith, and G. Goldsmith.

The Commissioners of South Australia again contributed garden productions, in the form of tinned fruits of the *Quince*, Pear, Apricot, and Plum.

Messrs. Vilmorin-Andrieux & Co. exhibited a collection of *Endives*, many of which are unknown, under the names given, to growers in this country.

Messrs. J. Carter & Co. exhibited *Bienheim Orange Tomato*, a pink-coloured fruit, round in form, stated to be Mr. Carter's Green Gage and Carter's Dedham Favourite.

Mr. Barlow, York Nurseries, Stamford Hill, showed fourteen fruits of *Tomato*, weighing 7½ lb. It was incorrectly marked as being Hathaway's Excelsior. Mr. C. Ross, Springfield Gardens, Ulverston, showed six fruits of *Royal George* from a tree four years old, and the same number of *Noblesse Peaches*, from a tree twenty-four years old; both samples were of a large size, the fruit from the old tree being larger if anything than the others.

VEGETABLES: COMPETING CLASSES.

In the collections the 1st prize fell to Mr. Waite, Glenhurst, Esher, who is becoming a redoubtable exhibitor of vegetables at metropolitan and other shows; The different items were excellent. But little behind the winner in general good quality came Mr. Beckett, Cole Orton Farm, Fenn, Bucks; and 3d, Mr. Buss. We observed that what was novel amongst the sorts shown, but several which appeared to be old varieties under new names.

MATLOCK BATH HORTICULTURAL AND FLORAL: August 7.

This Society, which commenced in a small way about six years ago, is steadily growing in importance, and especially so since the establishment of the Pavilion Gardens with its handsome concert hall furnished the Society with an excellent place in which to hold its show. On this occasion, the weather being beautifully fine, an immense company attended, visitors coming in from Derby, Manchester, Chesterfield, Nottingham, &c., and the sum of over £187 was taken, mainly in shillings. The Postmaster of Matlock Bath, Mr. A. Clark, is a most energetic and active member, and is assisted by Mr. Edward Hood. Secretary, and is assisted by Mr. Edward Hood. The exhibition bids fair to become a very influential and popular one in the district under their management.

GROUPS.

In the spacious central hall of the Pavilion were arranged the groups of plants, occupying spaces not exceeding 200 feet, competing for the handsome money prizes open to all England. There were three entries, and being arranged in the form of a crescent, had a very imposing effect. The best came from Mr. Geo. Williams, gr. D. S. Baerlin, Esq., Didsbury, Manchester. From a bed of Maidenhair Ferns rose *Crotons*, *Draeces*, *Ialms*, &c., with dwarf flowering plants dotted here and there. Mr. A. Anderson, gr. D. W. Walker, Esq., Lea, Matlock, was 2d, having an excellent lot of flowers and flowering plants, of which a good deal more could have been made from an artistic point of view. 3d, Mr. C. Yates, gr. to R. Wildgeese, Esq., Lea, Matlock Bath.

Prizes were also offered for groups of plants arranged on raised tables, but these being only 3 feet 6 inches in width it was difficult to make anything like an effective arrangement, and it would be much better if for the future, the collections could be arranged on the floor. Mr. Barlas, gr. to Mr. F. C. Arkwright, Esq., Willersley Castle, Cromford, was 1st, with a charming lot of *Crotons*, *Draeces*, *Ferns*, &c., edged with Maidenhair Fern and *Panicum variegatum*; 2d, Mr. John Brown, nurseryman, Matlock Bath, who had a table of gay flowering plants

Plants were also shown by Amateurs and cottagers, but contained nothing worthy of special notice.

CUT FLOWERS.

In the class for twenty-four cut blooms of *Roses*, Mr. John Henson, florist, Derby, was 1st with a nice fresh lot; Mr. R. W. Proctor, nurseryman, Chesterfield, being 2d. Mr. Henson also had the best twelve *Dahlias*, fine blooms for this district at this season of the year.

Cut zonal *Paragoniums* in twelve bunches, three trusses in a bunch were a very fine feature; Messrs. J. R. Pearson & Sons, Chiswell Nurseries, Nottingham, being run very hard indeed for 1st place by W. Carrington, who was a remarkably good 2d.

Mr. Henson was the only exhibitor of twelve spikes of *Gladioli*, having some very good ones for the season of the year. Mr. Henson also had the best eighteen bunches of cut flowers, staging a very good lot indeed; Mr. J. Stevenson, gr. to A. Vathall, Esq., Alton Manor, Matlock, being 2d.

Bouquets and baskets of *Roses* were a pretty feature, and good prizes being offered there was an excellent competition.

The following subjects, staged not for competition, were Highly Commended:—Cut *Roses* from Messrs. Dickson, Brown & Tait, and Dickson & Robinson, both of Manchester; and *Carnations* and fancy *Pansies* from Mr. R. W. Proctor, nurseryman, Chesterfield.

FRUIT.

In this department of the show, Mr. J. H. Goodacre, The Gardens, Elvaston Gardens, Elvaston Castle, scored the leading honours; he had the 1st prize for eight dishes, staging fine *Black Hamburg* and *Muscats* of *Alexandria* Grapes, *Cayenne Pine*, *Peaches*, *Nectarines*, *Elton Pine*, *Strawberries*, *Cherries*, and *Melon*; 2d, Mr. Jos. Ward, gr. to C. H. Oates, Esq., Ridding's Home, Derbyshire.

Mr. Barlas had the best six dishes, staging a very creditable lot.

In the class for four bunches of *Grapes*, Mr. Goodacre was 1st with two bunches each of *Madresfield Court* and *Matrat* of *Alexandria*; 2d, Mr. Jos. Ward, with excellent *Muscats* *Hamburg* and *White Muscats*.

Mr. Goodacre was 1st both with two bunches of black and white *Grapes*, staging in the first instance admirable *Muscats* of *Alexandria*, and in the second *Black Hamburg*. Mr. Anderson was a good 2d with white, and Mr. Ward with black *Grapes*.

Peaches, *Nectarines*, *Melons*, *Tomatos*, and *Cucumbers* were well represented.

VEGETABLES.

The best collection of twelve dishes was from Mr. John Cothers, Matlock Bath; Mr. G. Richards, of the same place, being 2d.

There were classes for six dishes, and also for many single dishes, and in all cases the exhibits were good.

CLAY CROSS HORTICULTURAL: August 10.

NOTHING could have been more depressing than the circumstances under which the above Society held its twenty-ninth show on the above date. The weather, which was so beautifully fine for several days previously, broke up early in the morning, and drenching rain fell almost uninterruptedly until midday, completely saturating the ground, and making everything under foot uncomfortable in the extreme. It is a long time since the Society has suffered from bad weather, and its occurrence on the show day is the more to be regretted as the Clay Cross show is a great popular festival, and thousands come in from all parts when the weather is fine, and a large sum of money is taken at the gates. This is the twenty-third year that Mr. James Stollard, the Secretary, has acted in that capacity, and it is to his energy so much of the success of the annual gathering is due.

The show took place in the grounds attached to the residence of one of the leading managers of the Clay Cross Company. The exhibits were arranged in three large tents, forming three sides of a square, and the tents were so joined together that a continuous promenade was formed. In the middle tent were mainly arranged the exhibits in the principal division, open to all subscribers, and a very nice feature was thus formed. Hardy fruits and cut flowers and vegetables were wonderful features, being extensively shown, and of very fine quality.

PLANTS.

The prime feature of the show were the groups of miscellaneous plants arranged for effect, and occupying a space not exceeding 300 feet. Five of these completed, and being arranged in part on stages, they nearly filled the centre of one spacious tent, and made a great display. Decidedly the best came from Mr. J. Lyon, gr. to Viscountess Ossington, Ossington Hall, Newark, the arrangement consisting of a ground-

work of Maidenhair Fern, with Palms, Crotons, Dracaenas, &c., exhibited about it, a few large specimens being in the back. This group displayed excellent taste, and it was greatly admired. 2d, Mr. A. Webb, gr. to J. H. Manners-Sutton, Esq., Kelham Hall, Newark, with a very bold and striking group, in which large specimen Crotons, &c., played a conspicuous part. 3d, Mr. J. Ward, gr. to T. H. Oakes, Esq., Riddings, Derbyshire. Two other prizes were awarded.

Then there was a class for smaller groups, not exceeding 150 feet, and for Mr. J. W. Clements, gr. to S. P. Wood, Esq., Brambling House, Chesterfield, was 1st; 2d, Mr. C. Yates, gr. to R. Wildgoose, Esq., The Poplars, Cromford; 3d, Mr. J. Lyon.

The handsome prizes formerly offered for collections of stove and greenhouse plants, and which used to bring Mr. Cypher and others, were omitted from the schedule this year, consequently but few specimen plants were present, groups occupied so large a space. The prizes offered for stove and greenhouse plants, and for three, four, and two Orchids, brought a fairly good competition, but nothing worthy of special notice.

Mr. Webb had the best six Ferns; Mr. J. Frith, gr. to J. Jackson, Esq., Stubben Edge Hall, Chesterfield, being 2d.

Some very good Fuchsias were shown by Mr. J. W. Clements.

Mr. Frith was 1st with three fine specimen flowering Begonias, Mr. Ward being 2d.

Colts, zonal and variegated Pelargoniums, Balsams, Petunias, &c., were all numerously shown, and of good quality.

CUT FLOWERS.

Boxes of twenty-four bunches of stove and greenhouse cut flowers made a very fine feature—Mr. J. Ward being 1st, and Mr. A. Webb 2d.

Mr. R. W. Proctor, nurseryman, Chesterfield, had the best twelve Roses, staging good blooms of *Merveille de Lyon*, *Captain Christy*, *Comtesse of Kosebery*, *Dr. Chailus*, *Madame Eugenie Verdier*, *Siar of Waltham*, *Mrs. Laxton*, &c.; 2d, Messrs. J. K. Pearson & Sons, 15, Abingdon Street, Nottingham. The best specimen had the best twelve blooms of *Dahlia*; Mr. W. A. Holmes, Brampton Moor, Chesterfield, was 2d.

Some excellent Carnations and Picoetes were staged by Mr. R. W. Proctor, he being a long way 1st in both classes. Of Carnations he had *William Slack*, C.B.; *J. D. Hextall*, C.B.; *Rose of Stapleford*, R.F.; *Master Fred*, C.B.; *Arthur Medhurst*, S.B.; *Sir G. Wolsley*, P.P.B.; *Biddy Malone*, R.F.; *James Floyd*, R.F.; *Stanley Hudson*, C.B.; *Sportsman*, S.F.; &c. 2d, Mr. W. A. Holmes, Mr. Proctor's Picoetes included good blooms of red edges: *J. B. Bryant* and *Thomas William*; purple edges: *Baroness Burdett Coutts*, *Clara Penson*, *Muriel*, and *Nymph*; rose edges: *Daisy*, *Edith d'Ombra*, *Favourite*, and *Lucy*. In this class Mr. W. A. Holmes was 2d. In addition a very fine lot of Carnations and cut Roses were shown by Mr. Proctor, not for competition, and zonal Pelargoniums, also not for competition, by Messrs. J. K. Pearson & Sons, and Highly Commended.

Stocks were numerous and very fine; French and African Marigolds, Asters, Pansies, &c., were all shown in good condition by both amateurs and cottagers.

Mr. J. Ward had the best eigne of flowers and fruit for table decoration, Mr. John Dore, Tibshelf, being 2d. The best hall-room bouquet came from Messrs. J. K. Pearson & Sons, and also the best six button-holes; Mr. W. A. Holmes being 2d in both classes.

FRUIT.

One of the best displays of fruit seen at Clay Cross for some years past was exhibited on this occasion. Mr. J. Edmonds, gr. to the Duke of St. Albans, Bestwood Park, Nottingham, was 1st, with Black Hamburg and Muscat of Alexandria Grapes, very fine Peaches and Nectarines, Figs, Cherries, Melon, and an excellent Pine-apple; 2d, Mr. J. Ward, with a very good lot; Mr. J. Lyon being 3d.

Mr. A. Webb had the best Pine-apple, Mr. J. Crawford, gr. to Colonel Thorpe, Codington Hall, Newark, being 2d.

Mr. J. Lyon had the best dish of Peaches, Mr. T. Egglestone, gr. to F. Smith, Esq., Wiggfield Park, Chesterfield, being 2d.

Mr. Edmonds had the best dish of Nectarines, staging a remarkably good sample.

Mr. Crawford had the best six dishes of hardy fruits, a very good lot indeed; Mr. Edmonds being 2d, and Mr. A. Webb 3d.

Black Hamburg Grapes were finely shown. Mr. Lyon had the best two bunches of black, staging superb examples of Black Hamburgs; Mr. Ward being 2d, and Mr. Frith 3d, with the same variety.

Mr. Frith came in 1st with admirable bunches of white Grapes, having Muscat of Alexandria in splendid form; Mr. Ward being 2d, with smaller but finely finished bunches; and Mr. Crawford 3d, with fine bunches of Foster's Seedling.

Gooseberries, Currants, Cherries, Raspberries, and other hardy fruits were both numerously and finely shown.

VEGETABLES.

These were so largely represented, and so very good, that they made a large show in themselves. Mr. Crawford had the best twelve dishes—an admirable exhibit; Mr. J. Ward was 2d.

Mr. Frith had the best six dishes; Mr. Egglestone being 2d.

Potatoes were in abundance, and it seemed as if the judges favoured the largest rather than the most shapely roots; scab seemed to be characteristic of a good many of the samples. Among a large number of coloured rounds, Crampian and Reading Russet seemed to be preferred.

Notwithstanding the badness of the weather the excursion trains brought a great many visitors into the town; the weather cleared in the afternoon, and perhaps the takings at the gates proved better than was at one time feared.

BRACKLEY HORTICULTURAL SHOW.

This show was held on Tuesday last, and, as usual, the exhibits proved a decided success, but the weather being so very wet the greater part of the day caused great falling off in the attendance. The worthy Hon. Secs., Messrs. R. J. and A. H. Russell, as on previous occasions, provided a capital repast for gardeners and their assistants, which was highly appreciated.

The groups of ornamental and flowering plants arranged for effect were numerous, and most tastefully arranged, especially so in the prize group of Mr. John Price, gr. to the Hon. Percy Barrington, as also that of Mr. Clarke, gr. to the Earl of Ellesmere.

W. L. Bird, Esq., Norton Hall, carried off 1st honours for six ornamental foliage plants, the 2d prize going to the Earl of Eppingham.

The decorations for a dinner-table, fruit included, brought out only two competitors, in the persons of Mr. Haskins, gr. to the Duke of Buckingham, and his better half, Mrs. Haskins, who on this occasion proved it beyond all doubt by securing the coveted 1st prize of £3; the design was most elaborate, and, as it deserved, proved a notable feature in the show. The 2d prize was awarded to Mr. Haskins, whose design was simply elegant.

Mr. Aggiss, gr. to the Earl of Eppingham, was a long way ahead with cut flowers, twelve kinds of blooms, each bunch one distinct variety; as also for Pelargonium blooms, eight varieties, not more than three bunches in a truss. The same exhibitor was awarded the premier prize for the best collection of fruit, six kinds, as also for the best Melon; thus fully maintaining the reputation of the Tusmore Gardens.

Mr. W. Rawlings, gr. to J. W. Brown, Esq., Croughton, staged twenty-four blooms of Roses, for which he was deservedly adjudged the winner of the 1st prize.

Vegetables were especially strong, and the quality excellent. W. L. Bird, Esq., took the 1st prize for the best collection of eight kinds, very closely followed by the Earl of Ellesmere.

The Onions were very fine, and the competition keen, the 1st and 2d prizes going to the Rousham Park Hero, grown by R. J. Russell, Esq., and Mr. Gunthorpe.

The cottagers' productions were extremely good, more particularly the stump-rooted Intermediate Carrots and Long Red Surrey, as also the Parsnips, Potatoes, Peas, and Rousham Park Hero Onions, which gained 1st and 2d prizes, some wonderfully good bulbs being noticed in the prize collection.

MISCELLANEOUS.

Mr. Turner, of Slough, exhibited a box of magnificent Picoetes and Carnations which were greatly admired; and Mr. Deverill, of the Royal Seed Stores, Banbury, a fine display of Onions, extraordinary for the time of year, thirty-six bulbs weighing upwards of 40 lb., the two largest scaling 3 lb. 2 oz. Mr. Perry, of the Banbury Nursery, also exhibited a pretty basket of Roses, crosses, &c.

WOODSIDE HORTICULTURAL.

The annual show of this Society was held in the Town Hall, Woodside, near Aberdeen, on August 7, and was in every way as successful as in former years. The number of exhibits was less than last year, being 627 against 756, but the quality was superior to that of last year, and fully made up for the deficiency in number. There were only two divisions this year—professionals and amateurs being classed together, and the other division being set apart for working men. Although there were not many entries the amateurs held their own against the professionals, and not much difference could be noticed between the different lots. The amateur and professional division consisted chiefly of pot plants, Tree Ferns, Pelar-

goniums, Fuchsias, Petunias, Lycopods, Begonias Myrtilles, &c. For pot plants, Mr. S. Maitland carried off the principal honours, having premier position for greenhouse and Cape Heaths, Ferns, show Pelargoniums, and others. Among the other prize winners here were Messrs. J. Menzies, D. Fraser, and John Yule. In this division there were also grand collections of cut flowers, fruit, and vegetables, in which Mr. Maitland again distinguished himself. The working-classes division was highly interesting, and reflected great credit on the exhibitors. In both divisions the display of small and bush fruit was exceedingly fine, both in size and quality.

TREES AND SHRUBS.

LARGE DECIDUOUS CYPRESS.

The largest and finest tree of this kind, *Taxodium distichum*, I have seen in the grounds at Longford Castle, near Llanrwst. It is fully 50 feet high, girths 9 feet 9 inches at a yard up, and has a spread of branches covering a diameter of fully 30 feet. *Pinus Cembra* and *P. Strobus* do remarkably well at the same place, many of the latter towering to over 80 feet in height, with clean smooth stems of 8 feet girth and upwards at 3 feet from the ground. *A. D. Webster*.

CEANOTHUS GLOIRE DE VERSAILLES.

Amongst very showy free-flowering evergreen shrubs for covering walls, a worthy place is held by *Ceanothus Gloire de Versailles*. Just now a goodly portion of one of the walls at Chiswick, is literally aglow with this particular variety—a desirable kind—its numerous panicles of lightish-blue flowers having a very pretty effect set off by its green foliage.

OLEARIA JAASTII.

In the mixed shrubby border at Chiswick, near to the Council-room, is a fine specimen of this useful, neat, evergreen, flowering shrub, bearing clusters of little star-shaped white flowers, which are somewhat sweetly scented. Some interest attaches at the present time to this plant. It is named after Sir Julius von Jaast, one of the New Zealand Commissioners in connection with the Colonial Exhibition now being held at South Kensington—and one who took, and still takes some interest in the New Zealand fernery, a conspicuous and pretty feature at the Exhibition. *B.*

EURYCHYA PINNATIFIDA.

Messrs. Veitch send us flowering sprays of this very lovely flowering shrub of which we gave a figure at p. 337, vol. xiv., 1880. The branches are stiff, of a deep purple colour, and bear pinnate leaves like those of a Rose, but of a deep green colour and somewhat leathery texture. The flowers are like those of a green *Cistus* without the blotch. It is one of the loveliest of hardy shrubs.

PAVIA MACROSTACHYA.

Messrs. Veitch send us from Combe Wood specimens of this very beautiful flowering tree. It bears elegant palmate leaves of finer texture than those of the common Horse Chestnut, and with long slender purplish leaf stalks. The white or pinkish flowers are borne in erect narrow pyramidal spikes, and are very beautiful. It is a small growing tree, which should form part of all collections. A figure of it was given at p. 636, vol. viii., 1877.

PRUNUS PISSARDI.

Paying a visit to my former employer, Mr. Vetter, superintendent of the well-known Wilhelmshöhe Park, he took me round his extensive collection. "Here are ripe Plums," said he. I doubted. "Look here," said he; "are these young Plums not just as dark red as ripe ones?" Yes, so they were, but they were not ripe; the fruits in question were young fruits of *Prunus Pissardi*, showing just the same colour as the leaves of this beautiful shrub or tree. Mr. Vetter showed me also one of the most striking novelties, the cut-leaved Pear tree. The plant is still a small one, and must become very beautiful when it grows older. *C. Wissenbach, Friedhofs-Inspector, Cassel, Germany.*

PUBLICATION RECEIVED.—*Catalogue of Chrysanthemums*. By a Special Committee of the National Chrysanthemum Society (London: E. W. Allen, 4, Ave Maria Lane).

THE ADVANTAGES OF TOBACCO.

DR. PEREIRA states in his *Materia Medica* that he is "unacquainted with any well determined ill-effects from the practice of smoking," and Christison speaks of it as a luxury used all the world over without any bad effects having been clearly traced to it."

In a letter of Dr. Parke's, author of *Parke's Manual of Practical Hygiene in the Lancet*, p. 384, 1880, he confesses that he has searched in vain for any satisfactory evidence of the harmful effects of Tobacco, and that it was for this reason that its consideration was not given place in the work mentioned.

The fact has been pointed out that men are on the whole as healthy as women, while nine out of ten of the male population of the world use Tobacco, and women as a rule abstain. In the learned professions about one-half of the ministers are addicted to it in some form, three-fourths of all physicians, and nine-tenths of members of the legal fraternity.

In looking calmly at the Tobacco question, there is one feature calculated to excite alarm, and that is the habit of chewing and smoking so widely practised among boys. This, to young growing boys, is, unqualifiably hurtful. They voluntarily endure the first disagreeable effects of the Tobacco to acquire what they consider an accomplishment, the habit is finally confirmed, and with an entire ignorance of its powers, added to a tendency to immoderation, the growth and development is often seriously interfered with, and the worst results follow. They smoke and chew generally the worst Tobacco, and to a degree which would positively be harmful with the majority of adults. This matter should be corrected by proper action of our legislators, with whom the responsibility rests. Smoking, when done at proper times, facilitates digestion. The sense of relief obtained by a cigar, after a heavy meal, is well known to smokers. Dyspepsia sometimes follows the discontinuance of Tobacco, and is removed when the habit is resumed. While the abuse of Tobacco weakens the system and leads to emaciation, used intelligently it exerts a favourable influence upon nutrition.

Hammond, by observation upon himself, found a gain in weight with the use of Tobacco. Fiske attributed an increase of 20 lb. in three months to Tobacco. "Tobacco, when the food is sufficient to preserve the weight, increases it; when insufficient, and the body is losing, Tobacco restrains the loss" (Hammond). Boerhaave, of Holland, nearly 200 years ago, referred to Tobacco as being antidotal to hunger. It seems that the power to undergo severe exertion and fatigue, either mental or physical, is aided by Tobacco. "Soldiers of all nations use it. It was a standing injunction of Napoleon that his troops should have Tobacco, and it was of great advantage in the retreat from Moscow." (Fiske.) During our late war the soldier would be patient under very severe privations, if he but had a good supply of Tobacco to smoke or chew, and when on picket duty would risk his life to strike a match for his pipe.

Situations for loneliness are always rendered more tolerable by Tobacco, and it is the constant companion of those who lead lives of solitude, such as that of the herdsmen or ranchmen. A feeling of unrest or discontent made up of ill-defined longings, of imaginary disappointments, and unpleasant anticipations, commonly known as *ennui*, is responsible for much unhappiness. This unfortunate condition of mind is removed by the soothing influence of a cigar, and the moroseness and gloom are quickly dispelled. As much of every day is filled up with care, our degree of comfort in this life will depend largely upon our ability to bear it uncomplainingly. That Tobacco assists us to do this—that it enables us to look upon life more complacently, must be the conclusion of every one who has experienced its influence. That it enables us to toil with less fatigue is equally true. The readiest writers generally use Tobacco, and cannot accomplish the same amount of work in the same time without it, and those connected with newspaper and other literary work, who have often to write against time, find it of inestimable value.

Tobacco formerly enjoyed a deserved reputation as a medical agent, and was extensively used in scabies and other cutaneous disorders. It has been largely supplanted, however, in modern practice, by other remedies. The use of Tobacco during a mercurial course decreases the risk of salivation, and cases of pyralism have been reported cured by its employment.

Before the discovery of chloroform, Tobacco served a useful purpose in the hands of the surgeon in cases of strangulated hernia for obtaining complete relaxation. Tobacco constitutes a most valuable addition to the ordinary poultice in local painful affections. In two cases of cancer of the breast, by incorporating it in a local application, a marked advantage was noticed by the writer in the relief of pain. As an ingredient in asthmatic cigarettes, with belladonna, stramonium, &c., it is entitled to share in the remedial effect.

The limited medical range of Tobacco is unimportant in comparison with its social and physical influences. Among its many beneficent powers it appears to allay worry and lighten toil. It is an aid to mental work, and a help to reflection and placidity. It promotes sociability, and in the words of one of its champions, "makes a man act more like a Samaritan." While it is neither liked nor needed by animals, who loathe it, it seems to be required and craved by man, to whom its characteristic properties appear peculiarly grateful and often useful. It has repeatedly and unjustly been called a curse, but those who have written most of its beneficial effects, as a rule, have never used it. Indeed, this comforting substance is so far removed from the idea of a curse, that it should not be forgotten when we recount the many blessings of mankind. *Indian Agriculturist*. [Apart from the undoubted and direct injury done to young persons by the use of Tobacco, the worst probably that can be said against it is that a good many who smoke much drink in proportion. On the other hand, it enables many to dispense with alcoholic stimulants. If smokers would only smoke where the habit is not a nuisance to non-smokers there would be no cause of complaint.]

INDIAN NOTES.

BOTANIC GARDEN, SEEPPORE.—The Bengal Government resolution on the report of the Royal Botanic Garden, Seepore, for 1885-86, notices that a high standard had been kept up in the cultivation and arrangement of the garden. The show of Orchids was excellent, and the general appearance of the garden very satisfactory. A large quantity of Mahogany seed was received from Kew and Jamaica, much of which was distributed, and the remainder sown in the garden, from which about 20,000 seedlings have been raised. Other timber plants are also grown for distribution. Dr. King reports that further experience confirms him in the belief that the paper Mulberry tree, from which the "tappa" cloth of Polynesia, and the bulk of the paper of China and Japan is manufactured, finds a congenial home in the soil and climate of Bengal. This is important, and the fact should be made known widely, plants being distributed gratis to those wishing to cultivate this useful tree, the bark of which is considered by English paper-makers to be nearly the best of paper fibres. The utilisation of the common Plantain fibre for paper-making has been rendered possible, we are told, by the invention of a machine patented by a retired officer of the Madras army. The herbarium received material additions, specimens having been contributed by Mr. Kinstler from Malay, Mr. Pantling from the Eastern Himalayas, and other gentlemen from various parts of India, as well as from England, Australia, Germany, Java, and Penang. Nearly 54,000 plants were distributed, and about 9251 received during the year; 3202 packets of seeds were distributed, and 914 packets received.

ARABIAN DATE PALMS.

We note with satisfaction that there is some hope of the Arabian Date Palm being acclimatised in Bangalore. Mr. Cameron, the Superintendent of the Lal Bagh, Bangalore, writes as follows in his last report on these gardens:—"Acting on the suggestion of Dr. Bonavia, Civil Surgeon at Etawah, who is an authority on the subject, I applied to Government, and obtained sanction for the expenditure of two hundred rupees on introducing the Arabian Date Palm (*Phoenix dactylifera*) direct from the Persian Gulf. This work has been promptly and so far successfully carried out, thanks to Mr. Girdlestone, the

acting British Resident, who kindly gave me a letter of introduction to Colonel Ross, the British Resident at the Persian Gulf. In October we received 116 offsets of the finest varieties of Date, and excepting six, which I believe are dead, the offsets are doing fairly well. Being unrooted, the present dry season is much against them, but when the rains set in, I hope to see a decided improvement in their condition. Last January we received from the Persian Gulf 41 lb. of seed in pulp, and these have been distributed. The offsets and seeds arrived in capital order, and I am indebted to Mr. A. R. Hakim, Khan Bahadour, Assistant to the Political Resident, for much valuable information which accompanied them. But prior to receiving the above consignments I had obtained some seeds from Mr. Ridley, Superintendent of the Horticultural Gardens, Lucknow, where the Date Palm is already domesticated through the efforts of Dr. Bonavia and Mr. Ridley. This seed produced sixty-three healthy seedlings, which are now growing vigorously. An attempt was made to introduce the Date Palm in 1872-73, which resulted in failure; but Dr. Bonavia is sanguine of success, and I shall do everything in my power to support such a worthy object. Writing to me a few days ago, the Doctor urges the importance of sowing and planting periodically in the following words:—"I am very glad to hear you have made so good a start with the Date Palm. If you go on sowing and planting every year, when they begin to fruit you will have the satisfaction of knowing that every year more and more will fruit. But if you plant one lot, and then stop to watch the result, you will be sorry when you see the result that you did not make an annual sowing." I quite concur in the above opinion. To make the experiment felt we must obtain and sow large quantities of seeds at various centres every year. The importation of seeds is not an expensive measure, and, judging from the courtesy already experienced, I believe we have only to make our requirement known to be well served by the authorities at the Persian Gulf. *E. S.*" *Indian Agriculturist*, July 17.

Obituary.

THE LATE H. F. HANCE, PH.D., F.L.S., &c.—The sad news of the decease at Amoy on June 21 of Dr. Hance, H.B.M.'s Consul at that port, will produce feelings of the deepest regret amongst those who had the good fortune of his friendship; and by the scientific world, to which his eminent attainments and works as a learned and indefatigable botanist made him so well known and respected, his loss will be, if possible, even more felt.

Dr. Hance was born on August 4, 1827. He entered the Civil Service of Hong Kong on September 1, 1844, and was transferred to the Consular Service and appointed Vice-Consul at Whampoa in 1861. He has been an almost continuous resident in South China for nearly forty-two years.

On his arrival in China he seems to have commenced botanical investigations, beginning with laborious expeditions in plant hunting in Hong Kong and in forming a herbarium to assist him in his studies. These studies he gradually extended to regions far and wide in the Chinese Empire, from whence travellers and residents have delighted to furnish him with collections of plants. These studies were carried on almost to the day of his death. The collection of dried plants gradually accumulated until they now stand at the large number of about 22,000 species artistically mounted and scientifically named and arranged. The immense work which this entitled was carried on simultaneously with the discharge of his official duties in the Colonial and Consular Services.

Dr. Hance's chief botanical work was in descriptive and systematic botany; scarcely a month has passed for many years without seeing the publication of descriptions of some plants from China which were new to science, or notes on others which were new to the country.

In 1871 Dr. Hance published a supplement to the *Flora Hongkongensis*, which was much needed, as there had been many discoveries in the island subsequent to the publication by Bentham, a decade before, of the *Flora Hongkongensis*.

The first number in 1878 of the *Journal of Botany* contained a paper from the pen of this eminent author, entitled *Spicologia Florae Sinensis*. Contributions under this title have been appearing since that time,

and they contained "Diagnosis of New and Habits of Rare or hitherto unrecorded Chinese Plants" to the number of 633 species. Dr. Hance truly remarked in a quotation from Miquel at the commencement of this series of papers that—"Un pays sur lequel nos connaissances sont encore très-bornées, et qui, sous le point de vue de la géographie botanique et des questions qui s'y rapportent, mérite toute notre attention."

In addition to strictly scientific and technical work amongst other things, the following papers on subjects of economic and commercial importance were produced:—"On the Sources of the Chinese Matting of Commerce," "On the Silkworm Oaks of Northern China," "On the Source of Radix Galangae Minoris of Pharmacologists," "On the So-called Olives of South China."

In regard to his botanical work scarcely any one can take up and carry out the precise lines on which Dr. Hance has been for so long wisely engaged.

At the instance of the Kew authorities an enumeration of all known Chinese plants is being compiled. I believe Sir Joseph Hooker would have been very glad if Dr. Hance could have been induced to go to Kew and there undertake the direction of this work. In the report of the meeting of the Linnean Society in London on April 1 of this year this enumeration is mentioned as follows:—"The first part of a communication of a lengthened and technical character, entitled *Index Floræ Sinesis*, or an enumeration of all the plants known from China proper, Formosa, and the Luchiu Islands, together with their synonymy and distribution, was introduced by the authors, Messrs. Francis B. Forbes and Wm. B. Hemsley." I happened to be present at that meeting, and was very pleased to note the high estimation in which Dr. Hance was held by scientific men at home. In this work Dr. Hance could have rendered eminent services. As it is, however, his writings will be of the greatest service in the elaboration of the *Index Floræ Sinesis*.

Dr. Hance kept up frequent correspondence with the principal botanical establishments of the world, and it is few of them which have not benefited from his generous donations of rare and valuable botanical treasures for herbaria.

When Hong Kong began to think (about a quarter of a century ago) of establishing a public garden, Dr. Hance was consulted as to the suitability of a site, and it was on his recommendation that that was chosen on which the old pond of the Botanic Gardens now rests.

Since the gardens began, in 1871, to assume a scientific character, Dr. Hance's extensive and high requirements have always been at our disposal, and they have been extensively availed of in botanical matters, a regular and large correspondence having been maintained with him on scientific subjects of mutual interest, which has been greatly to the advantage of the scientific work of the Botanical Department.

Dr. Hance was ever ready to furnish information and help without regard to the trouble it gave himself, and botanists making visits to his extensive herbarium and library were sure to meet with the greatest courtesy and hospitality, and to depart with a fund of new information. His death makes a gap which will not soon be filled, and many will feel the acute pangs of grief which follow the loss of a friend.

Dr. Hance was buried at Hong Kong, June 26, 1886. *C. Ford, Hong Kong.*

— MR. T. CHAPMAN.—Lovers of the Carnation and Plectone will hear with pain of the death of Mr. Tom Chapman, of Leicester, who passed away on the 1st inst., after three weeks of grievous suffering from sunstroke, aged 27. He was a member of the committee of the Oxford Carnation and Plectone Union, and a thorough lover of the flowers. Mr. E. S. Dodwell has named one of his fine scarlet-flake Carnations after him. Though comparatively young, he had endeared himself to a wide circle of friends by the simplicity of his character and his ingenious bearing; and his floricultural brethren have to mourn the loss of a most promising florist.

— WILLIAM FLETCHER.—We regret to record the death, on August 9, of William Fletcher, of Ottershaw Nursery, Chertsey. He had been at the above nursery for sixty-two years, and for the last thirty-three years proprietor. He was a generous patron of horticulture.

STATE OF THE WEATHER AT BLACKHEATH, LONDON, FOR THE WEEK ENDING WEDNESDAY, AUGUST 11, 1886.

MONTH AND DAY.	BAROMETER.		TEMPERATURE OF THE AIR.					Hygro-metrical Deductions from Glaisher's Tables 7th Edition.	WIND.	RAINFALL.

- Aug. 5.—The day was fine till the evening, and the sky was overcast from 6 P.M. to—
 6.—Fine, but frequently cloudy, sky deep blue afternoon; fine night
 7.—Fine morning, but frequently cloudy and dull; afternoon the sun shone brightly; fine night.
 8.—Fine morning sky frequently overcast, very fine afternoon, rain from 10 P.M. to 2 A.M.
 9.—Fine, but chiefly dull with gleams of sunshine at times.
 10.—Heavy rain in the morning, afterwards fine but dull.
 11.—A very fine day throughout.

LONDON: Atmospheric Pressure.—During the week ending August 7, the reading of the barometer at the level of the sea decreased from 29.78 inches at the beginning of the week, to 29.65 inches by 9 A.M. on the 2d, increased to 30.13 inches by 9 A.M. on the 4th, decreased to 29.93 inches by 5 P.M. on the 6th, and was 29.97 inches at the end of the week.

The mean reading of the barometer for the week at the level of the sea was 29.96 inches, being 0.18 inch lower than last week, and 0.03 inch above the average of the week.

Temperature.—The highest temperature in the shade in the week was 76° 0 on the 7th; on the 2d the highest was 69° 2. The mean of the seven high day temperatures was 69° 2.

The lowest temperature in the week was 49° 0, on the 3d; on the 7th the lowest was 58° 2. The mean of the seven low night temperatures was 53° 5.

The greatest range of temperature in one day was 18° 7 on the 3d; the smallest was 6° 7 on the 2d. The mean of the seven daily ranges was 15° 7.

The mean daily temperatures were, 58° 0 on the 1st; 57° 2 on the 2d and 3d; 56° 5 on the 4th; 61° 0 on the 5th; 65° 2 on the 6th; and 66° 7 on the 7th. These were all below their averages, with the exception of 6th and 7th, which was 3° 2, and 4° 5 above, by 3° 4, 5° 1, 5° 1, 5° 7, and 1° 1 respectively.

The mean temperature of the week was 60° 4, being 1° 1 higher than last week, and 1° 8 below the average of the week.

The highest reading of a thermometer with blackened bulb in vacuo placed in the full rays of the sun, was 131° on the 7th. The mean of the seven readings was 117°.

Rain.—Rain fell on two days to the amount of 0.18 inch.

ENGLAND: Temperature.—During the week ending August 7, the highest temperatures were 79° 6 at Cambridge, 76° 6 at Blackheath, and 76° at Hull; the highest at Preston was 66° 6, and at Liverpool and Newcastle 68°. The general mean was 72° 5.

The lowest temperatures were 38° 9 at Wolver-

hampton, 42° at Sheffield and Sunderland; and the lowest at Blackheath was 49° 9, at Liverpool 48° 2, and at Brighton 48°. The general mean was 44° 7.

The greatest ranges were at Wolverhampton, 35° 6, at Cambridge 35°, and at Hull 33°; the least ranges were 19° 8 at Liverpool, 20° at Preston and 24° Newcastle. The general mean was 27° 8.

The mean of the seven high day temperatures was highest at Cambridge 72°, at Truro 69° 3, and at Blackheath, 69° 2; was lowest at Preston 62° 6, at Liverpool, 63° 4, and at Newcastle; 63° 6. The general mean was 66° 6.

The mean of the seven low night temperatures was highest at Blackheath, 53° 5, at Plymouth 53° 4, and at Liverpool 53° 3; and was lowest at Wolverhampton 48°, at Sunderland 48° 5, and at Hull 48° 0. The general mean was 51° 2.

The mean daily range was greatest at Cambridge, 21° 3, at Hull 19° 4, and at Truro 17° 7; and was least at Liverpool, 10° 1, at Preston 10° 9, and at Newcastle 13° 6. The general mean was 15° 4.

The mean temperature was highest at Blackheath, 60° 4, at Cambridge 59° 5, and at Truro and Brighton 58° 6; and was lowest at Wolverhampton 51° 8, at Newcastle 55°, and at Preston 55° 3. The general mean was 57° 3.

Rain.—The largest rain fall was 0.81 inch at Newcastle, 0.64 inch at Preston, and 0.49 inch at Leez; the smallest fall was 0.07 inch at Sheffield, 0.08 inch at Sunderland, 0.09 inch at Wolverhampton, and 0.11 inch at Cambridge. The general mean fall was 0.29 inch.

SCOTLAND: Temperature.—During the week ending August 7, the highest temperature was 73° at Aberdeen, the highest at Greenock was 64° 5. The general mean was 67° 5.

The lowest temperature in the week was 36° at Glasgow; at Leith the lowest was 43°. The general mean was 40° 2.

The mean temperature was highest at Dundee, 56° 4; and lowest at Glasgow 53° 5. The general mean was 54° 8.

Rain.—The largest fall was 0.53 inch at Greenock, and the smallest fall was 0.05 inch at Dundee. The general mean fall was 0.17 inch.

JAMES GLAISHER, F.R.S.

SUMMARY OF TEMPERATURE, RAINFALL, AND DURATION OF BRIGHT SUNSHINE in the United Kingdom, for agricultural and sanitary purposes, for the week ending Monday, August 9, 1886, issued by the Meteorological Office, 116, Victoria Street, London, S.W.:—The weather was generally fair during the earlier part of the period, but towards the close the sky became cloudy or overcast, and at most of our stations falls of rain occurred.

The temperature has been about equal to the mean in "England, N.E.," "England, S.," and "Ireland, S.," but in the other districts it has varied between 1° and 3° below. The highest of the maxima, which were registered in most places either on the 6th or 7th, ranged from 62° to 73° in Scotland, from 71° to 74° in Ireland, and over England from 68° in "England, N.W.," to 79° in "the Midland Counties," and to 81° in England, S." The lowest of the minima were recorded either on the 3d or 4th, when the thermometer fell to 30° in "Scotland, N.," at (Wick), to 38° in "Scotland, E.," "England, N.W.," and "Ireland, N.," to between 39° and 43° over England, and to 53° in the "Channel Islands." Towards the end of the week the nights were warm and close, the thermometer at many of our southern stations not descending to 60°; at Hereford and in London the minimum temperature during the night of the 8th—9th was no lower than 63°.

The rainfall has been less than the mean in all districts except the "Channel Islands," where a slight excess is shown. Bright sunshine has been more prevalent than it was last week in the "wheat producing districts," but less so in the "grazing districts." The percentages of the possible amount of duration ranged from 19 in "Ireland, N.," to 39 in "Scotland, E.," and "England, N.E.," and to 46 in the "Channel Islands."

Depressions observed.—During the earlier part of the week the distribution of pressure over the United Kingdom was anticyclonic and the wind light and variable; on the 5th, however, the barometer fell decidedly on our western and northern coasts, and the high pressure area moved southwards. During the remainder of the period, small, shallow depres-

sions passed in an easterly direction over our Islands, the wind became light or moderate from between southerly and westerly, and the weather cloudy and unsettled.

Enquiries.

"He that questioneth much shall learn much."—BACON.

OAK BARK.—Will you be so good as to inform me what salts are in, or the manorial value of, ashes produced from Oak-bark burnt fresh as it comes from the tannery, not heated? And will it answer the same purpose in a Vine-border as wood-ashes are recommended for, and if so, what quantity is it advisable to dress on an old border? An Old Subscriber. [We have not been able to find any analytical analysis of the ashes of Oak bark, but as the bark is known to contain potash and lime, which would remain in the ash, it should have similar manorial value to wood-ashes. Ed.]

Answers to Correspondents.

CARNATIONS and MAIDENHAIR FERNS: S. T. If the first-named are not 22's there is no need to give them a shift now, as with proper treatment the plants should go well through the blooming season; but do not stop them any more. Stauden's manure would be suitable for these. Some of the Norwegian fishermen might suit the carnations, but Ferns generally do not like applications of manure unless in very weak doses.

CATERPILLAR EATING SKIN OF RIFE GRAPES. W. H. Strettham. The grub is that of Tortrix angustiora, which eats the skin, and a little of the flesh of the Grape, and joins several fruits together by a web. The grub appears to be only on one berry, which rots, and causes the neighbouring ones to decay also. Hand-picking is the only mode of getting rid of the pest.

CECILIAR OF LEBANON: H. The apparent young cones are really the male flowers. Astericus is correct. We shall be glad of the cones.

CUCUMBER. Birmingham. A case of gumming, due to mischief at the root.

ERRATA: In "Plant Illustrations," &c., p. 167, col. 2, Buddleya Colvillei, illustrated, is not yet introduced, is incorrect, the plant being now in commerce. Southampton show report, p. 125, col. 2, Mr. Ward, Longford Castle Gardens, obtained the 2d prize for eight varieties of Potatoes; Messrs. West and Oxford being respectively 3d and 4th.

EUCHARIAS and VALLOTA: F. P. The bulbs were infested with the Eucharis mite.

INSECTS: G. N. Your "tough-cased black parasite" are the cocoons of a moderate-sized black pupae Ichneumon, which probably from your account of their flying about your Gorsebushes are the natural enemies of the grubs of the Gorsebush sawfly. Do not destroy them. I. O. W.

MATRICARIA: J. C. & Sons. We do not see in the specimen as it reached us much difference from the now common form.

NAMES OF PLANTS: C. E. F. Cystopteris alpinica.—W. Little. Stanhopea insignis.—W. S. C. D. 1 and 2, not known; 3, Verbascum nigrum; 4, V. Lychitis; 5, A. Herveyana; 6, Calceolaria amplexicaulis.—J. Hill. Griselinia littoralis.—H. H. 1, Retinospora dubia; 2, not recognised; 3, Thunia, or Thiopsis Standishii; 4, Athrotaxis cupressoides; 5, Abies Pattoniana; 6, Podocarpus chilensis; 7, Viburnum Lantana; 8, Virgilia lutea; 9, Cercis Siliquastrum.—P. L. P. Peleopsis pustulata.—W. Smith. The Currant is like Shilling's White.—K. B. Salvia sclarea.—A. B. 1, Colutea arborascens; 2, Marsdenia erecta; 3, Santolina chamaecyparissus; 4, Pittosporum tenuifolium.—W. S. C. F. 1, Gentiana, specimen insufficient; 2, Dicentra formosa; 3, Balsaminia grandiflora; 4, Sedum rhodiola; 5, Campanula, species we are unable to name; 6, Campanula rapunculoides.—J. M. Quercus imbricata (North America)—C. E. F. Laetrea spinulosa (true).—B. Lamora. The species of Cattleya intermedia, the finer being the var. C. Lodigesii.—Constant Reader, 1, not recognised; 2, Malope grandiflora; 2, Hypericum hircinum; 3, Hypericum calycinum; 4, Otaria Haastii; 5, Eriothera macrocarpa.—Birmingham. Rous cotinus, the wig plant.

OFFICER D'ACADEMIE: C. This has nothing to do with the Academy of Science, as you suppose, but is a distinction conferred by the French Ministry of Public Instruction on those who have rendered service to literature, science, or fine art. After eight years of the "office" may be promoted to the grade of "Inspecteur d'Université," when he is entitled to wear a ribbon with gold palm leaves, instead of silver, as before. That is all we can tell you. We do not know if it has ever been conferred on an Englishman.

TOMATOS FOR WINTER USE WHOLE: B. A. They may be kept in weak brine, keeping them under the surface by means of a floating piece of board weighted with a stone. Keep the scum that will appear wiped away once a week.

VARIATION OF LEAVES OF SAKIRAGA SARMENTOSA: A. B. It is not known by what means the foliage of this plant became variegated, and there is no known method of producing variegation with

certainty. Fertility in the soil will bring it about, but not always, and great richness will cause variegation to partially disappear.

VARIETIES OF ADIANTUM: T. F. Both forms of A. cuneatum, No. 1 rather more cut or lobed than usual.

WATER WEED: J. H. A species of Conterva, or Water-silk. Rake it out, or turn in some swans. If these methods fail, there will be nothing left but to empty the lake, and let it remain dry for some months.

FOREIGN SUBSCRIBERS sending Post-Office Orders are requested to send them to the Publisher of this journal, 41, Wellington Street, Covent Garden, and to make them payable to William Richards, at the Post-Office, Drury Lane, London, W.C.

Table with 2 columns: Flower name and price per unit. Includes Arum Lilies, Carnations, Carnations, etc.

SEEDS.

LONDON: August 11.—Messrs. John Shaw & Sons, seed merchants, of 37, Mark Lane, E.C., write that nothing of importance transpired to-day in connection with the trade for farm seeds. There is a good trade with the Italian Rye-grass, which is being offered in sowing white Mustard, which is very much in the late advance, supplies being now reduced to very narrow limits. New English Trifolium incarnatum sells freely at Monday's quotations. The demand is now increasing daily, both for the early and late varieties. English prime white Wheat ranged up to 36s. and in some cases 36s. 6d., and red to 35s. American flour at about 19s. to 20s. suitable for milling, met some inquiry from country millers; but, apart from this, the market was dull and unaltered. Receipts of Barley continue small, and prices steady, with a moderate trade. Beans and Peas were 6d. dearer on the fortnight. Canadian White Peas, 27s. to 27s. 6d. Swedish Oats were rather dearer from scarcity. Russian in large supply but firm. Business in Wheat opened firm, but very quiet, and finishing dull. Flour was dull, but for most descriptions except American, prices had a firm bearing. Barley and Peas were firm, but quiet. Oats were firm at Monday's rates. Average prices of corn for the week ending August 7:—Wheat, 31s. 8d.; Barley, 22s. 10d.; Oats, 21s. 2d. For the corresponding period last year—Wheat, 33s. 6d.; Barley, 27s. 11d.; Oats, 23s. 6d.

CORN.

MARK LANE: Aug 9.—The market opened to-day with holders of English and Australian Wheat asking 6d. advance, but it was not currently obtained, and the business done was at the extreme prices of last week. English prime white Wheat ranged up to 36s. and in some cases 36s. 6d., and red to 35s. American flour at about 19s. to 20s. suitable for milling, met some inquiry from country millers; but, apart from this, the market was dull and unaltered. Receipts of Barley continue small, and prices steady, with a moderate trade. Beans and Peas were 6d. dearer on the fortnight. Canadian White Peas, 27s. to 27s. 6d. Swedish Oats were rather dearer from scarcity. Russian in large supply but firm. Business in Wheat opened firm, but very quiet, and finishing dull. Flour was dull, but for most descriptions except American, prices had a firm bearing. Barley and Peas were firm, but quiet. Oats were firm at Monday's rates.

Average prices of corn for the week ending August 7:—Wheat, 31s. 8d.; Barley, 22s. 10d.; Oats, 21s. 2d. For the corresponding period last year—Wheat, 33s. 6d.; Barley, 27s. 11d.; Oats, 23s. 6d.

FRUITS AND VEGETABLES.

COLUMBIA (East London): August 11.—Moderate supplies; prices fair. Quotations:—Apples, 2s. 6d. to 6s. per bushel; Pears, 2s. to 5s. do.; Green Gages, 2s. 6d. to 3s. 6d. per half sieve; Egg Plums, 2s. to 3s. do.; Cabbages, 2s. 6d. to 4s. per tally; Peas, 1s. to 2s. 6d. per sack; Scarlet Runners, 2s. to 2s. 6d. do.; French do., 1s. 6d. to 2s. 6d. per sieve; bunch Greens, 3s. to 5s. per tally; do. Turnips, 2s. per bunch; do. Carrots, 1s. 3d. to 2s. do.; do. Onions, 2s. 6d. to 3s. do.; Parsley, 2s. to 2s. 6d. do.; do. Mint, 1s. 6d. to 2s. do.

STRATFORD: August 10.—The market has been well supplied, and a fair trade was transacted at the undermentioned prices:—Cabbages, 1s. 6d. to 2s. per tally; Broccoli, 2s. per dozen; Carrots, household, 1s. 6d. to 2s. do.; Onions, 2s. 6d. to 3s. per dozen bushes; Apples, 3s. 6d. to 5s. per bushel; Peas, 4s. to 4s. 6d. per sack; Scarlet Runners, 2s. to 2s. 6d. do. 1s. to 1s. 6d. per sieve; Marrows, 2s. 6d. to 5s. per tally; Plums, 2s. 6d. to 3s. 6d. per half-barrel; Green Gages, 2s. to 3s. per flat.

POTATOS.

BOROUGH and SPITALFIELDS: Aug. 10.—Full supplies, excepting best kidneys, which are rather scarce and firm; other sorts have a drooping tendency. Quotations:—Hebrons, 4s. to 5s.; Early Roses, 3s. 3d. to 4s.; Kent and Essex Regents, 4s. to 5s. 6d.; Jersey and French Fincks, 5s. 6d. to 6s.; French rounds, 4s. to 5s. per cwt.

COLUMBIA (East London): Aug. 11.—Large quantities continue to arrive, and meet with a fair sale at the following quotations:—Magnums, 80s. to 90s.; Regents, 80s. to 85s.; Victorias, 65s. to 80s. per ton.

STRATFORD: Aug. 10.—Quotations:—Kidneys, 90s. to 100s.; Beauty of Hebron, 90s. to 100s.; Roses, 70s. to 75s.; Rounds, 70s. per ton.

Imports.—The Imports into London last week consisted of 200 bags from Rotterdam, 50 bags 30 tons from Cherbourg, and 49 tons from Barfleur.

HAY.

WHITECHAPEL: Aug. 10.—Trade dull, with large supplies, and a drooping tendency all round. Quotations:—Clover, prime, 70s. to 100s.; inferior, 70s. to 85s.; hay, prime, 70s. to 92s.; inferior, 45s. to 65s.; and straw, 26s. to 37s. per load.

Aug. 12.—A fair supply was on offer. The trade was dull at previous prices.

CUMBERLAND (Regent's Park): Aug. 10.—A plentiful supply, with a still drooping trade. Quotations:—Clover, best, 90s. to 103s.; second, 75s. to 85s.; hay, best, 84s. to 94s.; second, 70s. to 80s.; and straw, 30s. to 35s. per load.

STRATFORD: Aug. 10.—Quotations:—Hay, 80s. to 100s.; Clover, 90s. to 110s.; and straw, 30s. to 35s. per load.

Government Stock.—Consols closed on Monday and Tuesday at 101½ to 101 for both delivery and the account. Wednesday's figures were 101½ to 101 for both transactions. Thursday's final quotations were 101½ to 101½ for delivery, and 101½ to 101½ for the account.

THE GARDENERS' CHRONICLE

(Established 1841)

CONTAINS ARTICLES ON ALL DEPARTMENTS OF

GARDENING, PRACTICAL AND SCIENTIFIC,

REPORTS of EXHIBITIONS, REVIEWS of BOOKS, and NOTICES of all HORTICULTURAL MATTERS of CURRENT INTEREST.

HOME, COLONIAL, and FOREIGN CORRESPONDENCE.

Special attention is given to the following subjects :-

ALPINE PLANTS. ARBORETUM.—The. BEDDING PLANTS. BEES.—BOTANY. BULBOUS PLANTS. CHEMISTRY OF PLANTS. CONIFERS. DISEASES OF PLANTS. EVERGREENS. EXHIBITIONS.—FERNS. FLORISTS' FLOWERS.

FLOWER GARDENS. FORCING.—FORESTRY. FRUIT CULTURE. GREENHOUSE PLANTS. HERBACEOUS PLANTS. IMPLEMENTS.—INSECTS. KITCHEN GARDENING. LANDSCAPE GARDENING. LAWN.—LILIES. MACHINES. MANURES.—Analyses of.

MARKET GARDENING. NEPENTHES.—ORCHIDS. PALMS.—PLANTING. PLEASURE GROUNDS. POMOLOGY. POTATOS. RHODODENDRONS. ROCKERIES.—ROSES. SHRUBS and SHRUBBERIES. STOVE PLANTS.—SOILS. SUCCULENT PLANTS.

TOWN GARDENING. TRAINING. TRAVEL.—Notes of. TREES.—Deciduous and Evergreen. VEGETABLE CULTURE. VEGETABLE PHYSIOLOGY. VINES.—WALKS.—WALLS. WEATHER.—WEEDS. WINDOW GARDENING. WOODS, &c., &c., &c.

THE GARDENERS' CHRONICLE.

SCALE OF CHARGES FOR ADVERTISING.

Head Line charged for first.

Table with 4 columns: Line number, Length (e.g., 4 Lines...), and Price (e.g., 3 0). Includes rates for 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, and 14 lines.

AND SIXPENCE FOR EVERY ADDITIONAL LINE.

It set across two Columns, the lowest charge will be 20s. If set across three Columns, the lowest charge will be 30s.

Small table with 2 columns: Item (Page, Half Page, Column) and Price (e.g., Page... 2s. 6d.).

GARDENERS, and OTHERS, WANTING SITUATIONS. 25 words 12. 6d., and 6d. for every additional line (about 9 words) or part of a line.

THESE ADVERTISEMENTS MUST BE PREPAID.

IMPORTANT NOTICE. Advertisers are cautioned against having Letters addressed to Individuals at Post-offices, as all Letters so addressed are opened by the authorities and returned to the sender.

BIRTHS, DEATHS and MARRIAGES, 5s. each insertion.

Advertisements for the current year must reach the Office by Thursday noon.

All Subscriptions Payable in Advance.

THE UNITED KINGDOM: 12 Months, £1 3s. 10d.; 6 Months, 11s. 11d.; 3 Months, 6s.

FOREIGN (excluding India and China): including Postage, £1 6s. for 12 Months; India and China, £1 8s. 2d.

Post-office Orders to be made payable at 42, DRURY LANE, W.C., to W. RICHARDS.

PUBLISHING OFFICE and OFFICE for ADVERTISEMENTS, 41, Wellington Street, Strand, London, W.C.

Oil Paint no Longer Necessary.

HILL and SMITH'S BLACK VARNISH, for Preserving Ironwork, Wood, or Stone.

This VARNISH is an excellent substitute for oil paint or any outdoor work, while it is fully two-thirds cheaper. It was introduced upwards of forty years ago by the Advertisers, and its genuine good quality, notwithstanding a host of unprincipled imitations, is fully attested by its constantly increasing sale.

Sold in Casks of about 30 gallons each, at 1s. 6d. per gallon, at the Manufactory, or 1s. 8d. per gallon carriage paid to any Station in the Kingdom.

UNSOLICITED TESTIMONIAL.

From ALBERT LOWE, Esq., The Kyngs, Alderley Lodge. "Some twenty years ago I used your Black Varnish, and shall be glad if you will forward me a cask, as I consider it the best thing known for the preservation of all outdoor work, either wood or iron, that requires to be painted."

CAUTION.—HILL & SMITH would particularly warn their Customers against the various cheap Varnishes now so much advertised.

Every cask is legibly marked with their name and Registered Trade Mark as above, without which none is genuine.

Large Illustrated CATALOGUE on Pencils, Hurdles, Field and Entrance Gates, &c., sent free on application to

HILL & SMITH, Brierly Hill Ironworks, near Dudley; 118, Queen Victoria Street, London, E.C.; and 15, Stephen's Green, Dublin.

Table for Horticultural Glass showing dimensions (e.g., 14x12, 20x15) and prices for various sizes of glass panes.

21-oz. Foreign of the above sizes, in 100 and 200 feet boxes, 3s. and 4th. qualities, always kept in stock.

Propagating and Cucumber Glasses, and all Miscellaneous Glass Articles, can be obtained from

GEORGE FARMILOE & SONS, GLASS, LEAD, and GLAZIER MERCHANTS, 34, St. John's Street, West Smithfield, London, E.C.

HOLLOWAY'S OINTMENT and PILLS.—This Rheumatism and Gout. These purifying and soothing remedies demand the earnest attention of all persons liable to Gout, Sciatica, or other painful affections of the Muscles, Nerves, or Joints. The most delicate and sensitive of the affected parts have been patiently fomented with warm water, when the unguent should be diligently rubbed upon the adjacent skin, unless the friction should cause pain. Holloway's Pills should be simultaneously taken to reduce inflammation and to purify the blood. This treatment abates the violence, and lessens the frequency of Gout, Rheumatism, and Sciatica, which diseases, when they spring from impurities of or from any accidental weakness of constitution. This Ointment checks the local mischief. The Pills restore the vital powers.

WARNER'S CELEBRATED HYDRAULIC RAMS.

With new and important improvements. For the Water Supply of Villages, Institutions, Mansions, Gardens, Greenhouses, Stables, Fruit Fields, Farmyards, &c.

Gold Medal awarded at Calcutta Exhibition, 1883-4. Made in a variety of sizes to suit different lifts and falls of water. Gives constant supply for many years with but little attention and outlay beyond the first cost.

Prices upon application, from £4 4s.
COPY OF TESTIMONIALS.

"*Exeter, June 23, 1876.*
"Honoured Sirs,—In answer to your letter this morning about the Ram, it is working well, lifting over 12 pints per minute, the size of supply pipe being 2½ inches, the length 257 feet, the fall 11 feet 6 inches, the delivery pipe being 1 inch to the fountain, the length of pipe 1263 feet, rise of pipe from ram to fountain 78 feet, ram lifting 12 pints per minute."
"I remain, your obedient servant,
"JOS. MILLARD,
"Gardener to Sir Alexander Acland Hook."
"*Douglas, June 12, 1879.*
"Gentlemen,—Please find cheque. I have much pleasure in saying that I was asking the gentleman the end of last week how the Ram was working for him. He said it was working well, and he would not be without it for £200."
"Yours truly,
"ISAAC MILBURN,
"Range Manufactory, Strand Street, Douglas."
"Messrs. Warner."
"*Welford, Rugby, October 23, 1883.*
"Sirs,—The Ram you have just put up for me gives me great satisfaction. With the 15 gallons per minute supply it raises, about 600 gallons, 50 feet 11 inches, in ten or twenty and is no trouble to start working. I hope it will continue to work as well, for it is a great convenience."
"I remain, yours truly,
"JOHN GEE,
"Messrs. Warner & Sons."
"*Oxford, January 15, 1886.*
"Dear Sirs,—You will no doubt be glad to learn that the Ram you came down to advise about for Shroton has been fixed, and so far answers the purpose admirably."
"Yours, &c.,
"J. S. BROWNING."
"*Newton, Stebbell-on-Tyne, August 24, 1885.*
"Dear Sirs,—The Ram I had from you a short time ago is giving every satisfaction. Please send the duplicate valves for it, and oblige, yours, &c."
"JOSEPH SYMM."
"*128, Wilemarsh Street, Hereford, September 3, 1885.*
"Dear Sirs,—The Ram you supplied to me last year gives every satisfaction. I have not heard of their stopping since they were fixed.—Yours faithfully,
"ROBERT BAMFORD."
"*Kelvedon, Essex, January 13, 1886.*
"Gentlemen,—The Ram which I fixed at Little Braeket Mill for Jas. Faber, Esq., I am pleased to say, gives great satisfaction, and seems quite unaffected by the frost, working well when quite submerged by water and even lost to sight, its locality only indicated by the bubbles from the pulse valve, and notwithstanding the heavy flood we have had it has only stopped once. It throws off raises 2700 gallons in twenty-four hours.—Yours truly,
"JOSEPH POLLEY."
"JOHN WARNER & SONS,
"Crecent Foundry, Cripplegate, London, E.C.; and the Foundry Works, Winton-on-the-Ware, Essex."
"To be obtained of every Ironmonger and Plumber in the Kingdom."

BOULTON & PAUL, NORWICH.

 The GREAT SLEAD QUARRY, Brighouse, Yorks.

Oil Paint no LONGER Necessary.
HILL AND SMITH'S BLACK VARNISH, for Preserving Ironwork, Wood, or Stone.

This VARNISH is an excellent substitute for oil paint or any outdoor work, while it is fully two-thirds cheaper. It was introduced upwards of forty years ago by the Advertisers, and its genuine good quality has secured it a host of unprincipled imitators, is fully attested by its constantly increasing sale. It may be applied by an ordinary labourer, requiring no mixing or thinning, and is used cold. It is used in the grounds of Windsor Castle, Kew Gardens, and at the seats of most of the Nobility and Gentry, from whom the most flattering testimonials have been received.
 Sold in Casks of about 20 gallons each, at 1s. 6d. per gallon, at the Manufactory, or 1s. 8d. per gallon carriage paid to any Station in the Kingdom.
UNSOLICITED TESTIMONIAL.
 From ALBERTO LEONE, Esq., *The Rysling, Alstyre Lodge*.
 “Some twenty years ago I used your Black Varnish, and shall be glad if you will forward me a cask, as I consider it the best thing known for the preservation of all outdoor work either wood or iron, that requires to be painted.”
CAUTION.—HILL & SMITH would particularly warn their Customers against the various cheap Varnishes now so much advertised.
 Every cask is legibly marked with their name and Registered Trade Mark as above, without which none is genuine. Large Illustrated CATALOGUE on Request. Hurdles, Field and Entrance Gates, &c., sent free on application to

HILL & SMITH,

CARTERS' EARLY BULBS FOR FORCING.

To produce Beautiful White and Coloured Flowers for Christmas Decoration.

CARTERS' Earliest White Roman HYACINTHS.
The Largest Bulbs of the Year.
We do not keep a Second Size.

Per 100, 16s.; per dozen, 2s. 6d.

CARTERS' Double Roman NARCISSUS.

Per 100, 10s. 6d.; per dozen, 1s. 6d.

CARTERS' Paper-white NARCISSUS.

Per 100, 11s. 6d.; per dozen, 1s. 6d.

CARTERS' Red and Yellow VAN THOL TULIPS.

Per 100, 4s. 3d.; per dozen, 8d.

CARTERS' Extra Large SNOWDROPS.

Per 100, 3s.; per dozen, 6d.

ALL PARCELS CARRIAGE FREE.

Seedsman by Royal Warrants to

DUTCH BULBS.

DIRECT FROM THE GROWERS.

ANT. ROOZEN and SON, NURSERYMEN,
Overveen, near Haarlem, Holland.

Intending purchasers of **DUTCH BULBS** are invited to read **ANT. ROOZEN & SON'S CATALOGUE for 1886**, and see the large swing effected by **DE LINDEN BOUQUET WITH THE QUEEN**. The Catalogue, containing details of their immense Collections of New, Rare, and Fine Bulbs and Plants, and also particulars as to **FREE DELIVERY**, will be sent **POST-FREE**, on application to them, or to their Agents, **MERTENS and CO.**, 3, Cross Lane, St. Mary-at-Hill, London, E.C.

AFRICAN TUBEROSES, AND LILIU HARRISII,

Grown by **WM. RISLEY, Maritzburg, Natal.**

THE TRADE and GROWERS are hereby informed that the reports of this season's growth are of the most hopeful description. The Bulbs promise to be superior to any hitherto offered in the market.

Orders are now being booked freely for delivery in **AUGUST and SEPTEMBER**, and Buyers are advised to make an early application. Quotations very low.—Terms—net cash. For prices and full particulars apply to

WM. G. MAC GREGOR,
17, Fenchurch Street, E.C.

FERNS A SPECIALTY.

An IMMENSE STOCK, in SPLENDID CONDITION. ILLUSTRATED CATALOGUE, containing "Hints on Fern Cultivation," 1s.

SMALLER CATALOGUE, of over 1200 species and varieties, including Descriptive "LIST of NEW, RARE, and CHOICE FERNS," and "HARDY NORTH AMERICAN FERNS," free on application.

W. & J. BIRKENHEAD,
FERN NURSERY, SALE, MANCHESTER.

DUTCH BULBS CHEAP.
FRENCH BULBS CHEAP.

ENGLISH BULBS CHEAP.
See our Special Wholesale Catalogue of Bulbs,

Containing List of all the best varieties of **HYACINTHS, TULIPS, CROCUS, LILiums, DAFFODILS, IRIS, SNOWDROPS,** &c., free on application to

WATKINS & SIMPSON,
Seed and Bulb Merchants,
EXETER STREET, STRAND, LONDON, W.C.

PRIZE COB and other NUT TREES.
Gentlemen desirous of obtaining the true **WEBB'S PRIZE COB FILBERT TREES,**

AS ALSO THE **Kentish Cob** and other **NUT TREES,** should send their Orders as early as convenient to **MR. COOPER, F.R.H.S., Calcot Gardens, Reading,** of whom alone the various sorts can be obtained. **PRICE LISTS and PAMPHLETS** on application.

WEBB'S EMPEROR CABBAGE,

The Earliest and Best Cabbage,
6d. and 1s. per packet, 1s. 6d. per ounce, post-free.
7s. per pound.

Mr. J. Muir, in the "JOURNAL OF HORTICULTURE" of May 24, says:—"Our largest piece of Spring Cabbage measures 70 feet by 50 feet, and here we have many sorts growing. The best of all these at the present time is **WEBB'S EMPEROR.**"

	Per Ounce,	Post-free.

THE Gardeners' Chronicle.

SATURDAY, AUGUST 21, 1886.

TAPLOW COURT.

THE four miles of broad road between Taplow and Hedsor are bordered by the parks and gardens of four great houses. The lands of Cliveden, Dropmore, and Hedsor all approach each other, and touch the road at a spot called Nobleman's Corner; and if you should meet hereabouts a good-looking gentleman in a white hat with hair tending to the same colour, be sure you address him as "Your Grace." If by mistake you call him "My Lord" correct the error and add to that title, "Duke, I mean," or "Your Grace, I should say," for this gentleman is a great peer and land proprietor, the head of the ancient house of Grosvenor, owner of Cliveden and its gardens, which the public can visit by his favour during more weeks in the year than he ever does himself. If you meet Mr. W. H. Grenfell on the road, the owner of Taplow Court, know him for a young Englishman of adventurous spirit, who has travelled far in remote regions, and who opens his gates freely to those who wish to see his beautiful place of residence.

Taplow Court, too, was formerly the seat of a peer, the Earl of Orkney, and as recently as three years ago the Dowager Countess of Orkney was laid to rest at the age of seventy-six, in what was then the churchyard, a few paces from her former residence. The house is a particularly handsome one of solid brick, with ornamental chimneys and four storeys. It is situated at the head of the little village of Taplow, where the doors of the approach stand open during daylight, flanked by aged Cedars of Lebanon. The house lies straight before you, with pleasing glimpses of lawns and flowers, and a wealth of creepers—Ivy, Wistaria, and others—concealing the wall of the kitchen garden on the right. It is hardly the house of a country gentleman, being a little more palatial than country houses usually are, but it is well adapted in style and proportions for its situation, 20 miles from London, and in such a "hot corner," as a sportsman might say, for great peers and members of the aristocracy.

The celebrated Tulip tree, 80 feet in height and 12 feet in circumference, which is sometimes described in connection with Taplow and Mr. Grenfell, is still to be found, I believe, on the lawn of another Mr. Grenfell, of Taplow House, in another part of the parish.

There is a great Cedar of Lebanon here of the seventeenth century, with a head of many branches, fenced by the trees of the river cliff at the end of the lawn, and a gate below it opens into a famous avenue of the same trees planted at a later date. Mr. Wright, the superintendent of the gardens as well as land steward, states that he remembers an old labourer or foreman who planted the Cedars for Lady Orkney, and as Mr. Wright's term of service has reached thirty years, the trees may be eighty or ninety years old. They are large

for their age, and form a noble avenue of half a mile in length parallel with the cliff and river.

Steps lead to the river banks, and to the boat-house, as well as to a rustic summer-house built of roots on a ledge of the cliff, commanding the river. A weir, with plenty of water falling over it, forms an interesting feature of the landscape. Cookham is 2 or 3 miles above, and Maidenhead, with its high ground, crowned by the conspicuous spire of Boyne Hill church, lies opposite.

Even a word painter could hardly describe this delightful residence; the grounds around the house, where Nature offers such attractions that adventitious art is needless; the long views, the vistas through the banks of foliage, the English Elms, whose stately proportions prove the excellence of the soil; the smooth inviting turf of the lawns, and the Turkey Oaks and graceful specimen Deodars. The place is beautiful, without any formal traces of the efforts of those who have helped to make it so. Thirteen gardeners are employed. In connection with the kitchen garden there are capital buildings of the usual kind, including a bothy for three young men, five vineries, three Peach-houses, and several others for the culture of flowers, containing among other things some very noticeable white flowers, *Lapageria alba*, white Roses, *Stephanotis*, and *Gardenias*.

Previous to the year 1836 the parish church of Taplow stood close against the great house. It was then removed, and the graveyard, immediately under the windows, has become an unobjectionable outlook by the simple artifice of placing the memorial stones flat on the ground, leaving the rest to grass and Ivy, and to the concealment of shrubs. The rather unusual prospect which such an enclosure offered is further and fortunately blocked by a very ancient specimen of an earthwork, far older than the church itself. In exploring this mound a year or two ago, Mr. Rutland, Secretary of the Berks Archaeological Society, ransacked its very interesting contents and unfortunately undermined a Yew tree, which had crowned the tumulus, according to its estimated age, during 1,400 years. The grave therefore was almost as old as Christianity in this country. We now enjoy a spiritual faith and Mr. Rutland perhaps regrets that when the Yew tree subsided into the trench below, he was not quite, instead of almost, despatched to a better world. But Taplow is a pleasant place of residence for an archaeologist, since it is crowded with associations—Milton's mother was buried on the cliff here, and below runs the Thames, the great waterway along whose stream Romans, Saxons and Danes in turn pushed inland to the heart of the country. It is easy to understand that an archaeologist of Taplow might feel, in regard to leaving it, as Phillips the painter did when he had built his house and finished his garden at Hammersmith, and he was told he must die and go to heaven. "I would rather stop in Hammersmith," he said.

The pagan's body, or his dust, reached at a depth of 20 feet—for they trenched deep in those days; his gold fringe, drinking-horns, and other utensils, which were recovered, and have been described in great variety, are not in my department. H. E.

New Garden Plants.

ANTHURIUM SUBULATUM. *N. E. Brown, n. sp.*

SUBCAULESCENT. Petioles 10—18 inches long, 2½—3½ lines thick, terete, green. Lamina to 15 inches long, 4½—7 inches broad, elongate cordate-ovate, somewhat cuspidate acuminate, dark shining green, a little paler beneath; basal lobes about one-fifth as long as the front lobe, very obtusely and broadly rounded, not overlapping, with a parabolic subacute sinus between them, 1½—2½ inches deep, ¼—1 inch broad. Midrib and veins nearly equally prominent on both sides, rounded above, acute beneath; primary lateral veins 7—14 (in average leaves about 10) on each side the midrib and one on each side at its very base, all more or less uniting in an intramarginal vein 2—3 lines distant from the margin; the postical branches of the midrib not denuded at the sinus, and divided near their base into three strongly curved branches, all running out at the margin. Peduncle 9—12 inches long, 2 lines thick, terete, light green. Spathe spreading, white on both sides (or sometimes light green), 4½—5 inches long, 1—1½ inch broad, oblong, rather abruptly narrowed into a convolute subulate point about 2 inches long. Spadix stout, cylindrical, obtuse, 2—3 inches long, 4—5 lines thick, purple-red; flowers small, 1 line in diameter. A native of Columbia, introduced by Mr. W. Bull, of Chelsea.

This is a very distinct and rather pretty species, easily recognised by the very long subulate point to the white spathe, which is well set off by the purple spadix and dark green of the leaves. *N. E. Brown.*

ANTHURIUM MOOREANUM. *N. E. Brown, n. sp.*

Stem short with crowded internodes. Petioles about 18 inches long, 2½ lines thick, terete, faintly flattened down the face. Lamina 11—13 inches long, 8—10 inches broad across the basal lobes, sub-hastate, front lobe oblong-ovate, cuspidate acuminate, basal lobes oblong, with very broadly rounded tips; basal sinus widely gaping, broadly rounded at the base, 2—2½ inches deep. Upper surface of leaf bright green, under surface whitish-green. Midrib and primary veins prominent on both sides, but more strongly above; primary lateral veins 4—5 on each side of the midrib, which unite in a continuous intramarginal vein 2—3 lines distant from the margin, and one on each side at its very base, which runs out at the margin about halfway up the front lobe; the postical branches of the midrib are denuded for about half to three-quarters of an inch in the sinus, and divide in the basal lobes into three strongly curved branches, the two lowermost of which run out at the margin, whilst the innermost branch unites by a loop with the lateral branches of the vein arising at the base of the petiole. Peduncle nearly or quite as long as the petiole, terete, green. Spathe reflexed or spreading, 4—4½ inches long, 6—7 lines broad, linear-oblong, convolute acuminate at apex, purplish-green. Spadix shortly stipitate, 5—6 inches long, 2½ lines thick, terete, slightly tapering, olive-brown; flowers about three quarters of a line in diameter.—Native country unknown; cultivated by Mr. W. Bull, of Chelsea. *N. E. Brown, Herbarium, Kew.*

THE GENUS ODONTOGLOSSUM.

(Continued from p. 104.)

ODONTOGLOSSUM URO-SKINNERI.—This strictly cool-house Orchid, although introduced more than thirty years, is still not common. It has creeping rhizomes, flatish oval pseudobulbs, and arching, broad racemose leaves. The scapes are erect, flowers 2½ inches across; sepals and petals yellow, barred with brown; the lip, which constitutes the chief attraction of the flower, is cordate, white, profusely spotted and mottled with rose or mauve. The plant usually flowers in autumn, and lasts three months in bloom in a suitable house. Guatemala.

O. BICTONENSE resembles O. Uro-Skinneri in the form of its flowers, which, however, are only half the size of it. Flower-spikes erect, often 4 feet, bearing in succession many flowers, which individually and collectively last well, and often keep the

plant in bloom for more than four months in the year. Sepals and petals greenish-yellow barred with brown, lip cordate, bluish-white to rose in the different varieties. Guatemala.

O. B. SUPERBUM.—A fine variety, with sepals and petals rich brown, and lip rosy-purple.

O. B. ALBUM.—Sepals and petals yellow, barred with light brownish-yellow bars, and lip pure white. There are several varieties of this, some being small-flowered. The best has flowers as large as those of O. Uro-Skinneri, and of the same substance. A good example of it is in Mr. Lee's collection. O. bictonense, which was the first Odontoglossum introduced (1835), and its varieties, are very free-growing.

O. LONDESBOROUGHIANUM.—This is very distinct, and not near enough to class with any other. The plant has glaucous-green pseudobulbs, which are separated by running stems. The narrow ligulate leaves fall in winter, at which season the plants require keeping cool and rather drier than most Odontoglossums. The flowers, which much resemble some of the large yellow *Oncidium*s, are borne on the end of the stout scapes. Sepals and petals yellow barred with brown, lip large, often nearly 2 inches wide, bright yellow. It is a showy plant, requiring cool treatment and a drier atmosphere while in flower and until growth begins again, when a little extra heat in a well-ventilated house is beneficial to it. Mexico.

O. ROSEUM is a pretty dwarf growing plant, with small pseudobulbs and leaves resembling a small form of *Mesopitidium vulcanicum*, which plant its inflorescence also bears a likeness to in colour and general appearance, it is, however, structurally different. Flowers bright red, often two dozen on a spike; flowerspikes numerous in strong plants, thus forming very pretty objects. A cool-house plant from Peru.

O. REFUSUM.—This forms a pretty companion plant for O. roseum, it being of the same dwarf habit. Sepals and petals orange, lip oblong, varying in tint from yellow to orange. It is still rare, although Hartweg found it on rocks on the mountains of Saraguro, Peru, many years ago. It requires similar treatment to O. roseum. *James O'Brien.*

METHOD OF PRESERVING TIMBER IN JAPAN.

Now that we are getting Tea boxes from Japan, the following extract from the *Journal of Forestry* will be interesting. Be it noted, then, that the Japanese use only wood previously preserved as follows:—

PRESERVATION PROCESS APPLIED TO TIMBER.

At a distance of 20 or 30 chos (1 cho = about 120 yards) from the sea, and near the mouth of a stream, a large pond is dug, so that the sea may have free access to it. This is called Kakitorii (or storing pond). Its size is not fixed, but generally it contains an area of 14,000 or 15,000 tsubos (1 tsubo = about 36 square feet), and its owner keeps his office near by, so that he may transact his business on the spot. The circumference of the pond is built of stone or wooden walls, and a canal is dug on one side to communicate with the river, and thence with the sea; the flow of the tide being regulated by means of a sluice. The pond should not be deeper than 5 feet in the central parts at full tide, and not shallower than 2 feet in the margin at ebb tide. The right proportion of salt and fresh water for the pond is six parts of the former to four of the latter, for if the salt water exceeds this proportion timber becomes blackish in colour, and is liable to be much eaten by worms; if, on the other hand, the proportion of salt water becomes less, it is much sooner decayed than otherwise. The velocity of the flow of tide should also be very carefully regulated, for if the current is either too rapid or too slow, timber is again very liable to be much injured by worms. Hence in those places where there are two or three ponds near one another, their owner generally amalgamates them, on agreement, by means of small canals, which arrangement regulates the flow of tide very considerably. Timber for storing is usually piled in five layers according to its quality; the lowest layer consisting of middle-class timber; the next layer of first-class timber; the next layer above again of middle-class timber; the next layer of third-class timber; whilst the uppermost layer, which

IMPROVED METHOD OF PRESERVING WOOD.—The improved French method of preserving wood by the application of lime is found to work well. The plan is to pile the planks in a tank, and to put over all a layer of quicklime, which is gradually slaked with water. Timber for mines requires about a week to be thoroughly impregnated, and other wood more or less (time according to its thickness). The material acquires remarkable consistence and hardness, it is stated, on being subjected to this simple process, and the assertion is made that it will never rot. Beech wood prepared in this way for hammers, and other tools for ironwork, is found to acquire the hardness of Oak, without parting with any of its well-known elasticity or toughness, and it also lasts longer. *Indian Forester.*

is usually exposed above the surface of the water, consists of very low quality, and by its weight the lower four layers are kept sunk under water. Those five layers are piled one upon another alternately at right angles, so that the whole arrangement presents the appearance of a toothed cube. Sometimes, however, the pile consists of only two or three layers; in that case they are tied to a big log (about 12 to 15 feet in length, and 7 or 8 inches in diameter) standing near by, and are thus prevented from floating about freely; sometimes also one or two separate pieces of different kinds of timber are kept in the pond for specimens. The durability of timber depends greatly on the amount of care bestowed on it, and to this end the washing is the most important. Twice in a year, generally in June or November, the cubical mass of timber above described is disengaged, and each piece is well washed by means of a straw brush. The different pieces are then reconstructed in a cube, but with the following alteration in the arrangement:—The middle-class timber, which before constituted the third layer, now forms the lowest layer, and the middle-class timber which in the former case was at the very bottom, now occupies the third layer. If washing cannot be done twice a year, it must be performed once a year at least. In the following table are shown (in the first column) the names of different kinds of timber, in the second column the number of years for which they may be preserved in the timber store, and in the third column the period at which they are best adapted for use:—

I.	II.	III.
Hinokai (<i>Thuya obtusa</i>)	for 8	after 3
Matsou or Momi (<i>Abies firma</i>)	4	15
Sugi (<i>Cryptomeria japonica</i>)	5	2
Tsuga (<i>Tsuga Sieboldii</i>)	6	2
Hiba (<i>Thuya dolabrata</i>)	8	3
Tswarei (<i>Thusa piceformis</i>)	8	3
Reyaki (<i>Zelkova Kuzaki</i>)	8	3
Kashi (<i>K. .. .</i>)	10	4

(The number of years is calculated from the day of felling, and the time which is spent before timber comes to the store is reckoned to be one year.)

A pond of 15,000 tembo in area can, on the average, store up about 10,000 pieces of timber. They are of various lengths, as the following figures show:—

Lengths of timber (in kens)	2,	3,	2.5,	4,	2.5,	4.5,	5,	6
Percentage number .. .	59,	29,	1.0,	5,	1.0,	5,	Per cent.	

Thus one-half of the whole timber in the pond is of 2 kens in length, one-fifth is of 3 kens in length, &c. (1 ken = 2 yards.)

At ordinary times, only three or four men are employed, whose daily wage is 35 to 45 k (7), but at the washing season fifteen men are employed daily for a period of about half a month.

SOME WORKMEN'S GARDENS.

AMONG the many beneficent schemes with which the honoured name of the Baroness Burdett Coutts is associated there is none more useful and productive of solid advantage to workmen and their families than cottage garden allotments. The boon is not the less appreciated because the recipient is conscious that he will owe whatever profit may accrue mainly to his own well-directed and persistent efforts, while leaving untouched the feelings of self-respect and independence which are the honest Englishmans' backbone. What is provided by the Baroness Coutts' considerate kindness at Highbury Rise is the opportunity for profitable employment of spare time, and not a mere charitable dole. It is an admirable example of what may be done by helping working men to help themselves. There is a consequent advantage—moral, physical, and pecuniary—in the growth and encouragement of industrious, thrifty, order-loving, and property-respecting habits. Such institutions, moreover, when well-managed, as both this and the older society at Highgate undoubtedly are, are eminently calculated to foster a love and attachment to the home and its surroundings, and to encourage the desire of ownership and possession in the soil—a feeling of the highest value and importance to the working classes. A pleasing feature in the case is the interest taken by the wives and children in the management of the gardens, and their eagerness to give assistance in weeding and watering, especially in carrying home the produce. When country and town children are taught systematically something of plant life and gardening by means of small plots attached to, or conveniently accessible from, the school premises, such

allotments as these will form an admirable supplement to the school-teaching by affording opportunity for study and experiment, as well as employment healthful, profitable, and pleasant.

Holly Lodge (fig. 48, p. 237), the charming old-fashioned residence of the Baroness and Mr. W. L. A. Burdett-Coutts, M.P., occupies, as our readers are no doubt aware, a picturesque and elevated site near the summit of Highgate Hill. Within less than five miles of Charing Cross, embowered among rugged Elms, Oaks, and Chestnuts, with huge banks of evergreens and Rhododendrons, beds of Roses, arches festooned with fragrant Honeysuckle and Clematis, brilliant parterres, borders of sweet old-fashioned flowers, the softest and smoothest of green turf, the song of the blackbird and thrush, and the plaintive cooing of the wood-pigeon, so pleasantly suggestive of woodland solitudes,—one might fancy that great London, with its din and turmoil, were a hundred miles distant. But walk a few yards down that shady path and the illusion is dispelled. From the little terrace by the gardeners', "Mr. Willard's," cosy cottage the great panorama opens before us as in a dream. Behind is a semicircle of tall trees, green meadows slope in front—a cricket-match is going on in the field below—then another belt of trees, surrounding the picturesque cottages of Holly Village, and beyond, stretching upwards to the horizon, with just grey haze enough to lend mystery and suggestiveness to the picture, the houses, towers, and steeples of mighty London.

Near to Holly Lodge are the allotment gardens, adjoining the St. Anne's Schools. They contain, at present, an area of 3 acres, but it is hoped that the great success which attends their cultivation, and the urgent desire for further extension from a numerous and increasing population, will be met by an addition of 2 acres, the remaining portion of the enclosure, originally a brickfield. The land is let to the committee of the Society at £1 an acre only. It is the property of the Baroness Coutts, and would be of great value, of course, as a building site. There are forty-eight tenants, each holding a plot of 9 poles. A cart-road traverses the ground, enabling any tenant to bring manure to his garden without crossing the land of another. There is a large iron tank in the centre, with an unlimited supply of water laid on. For the use of this uniform charge of 1s. 6d. each tenant is made. The rent is 1s. per pole; and, with the exception of the small payment for water, there are no other charges whatever. The tenants comprise labourers, mechanics, and policemen—the latter, as we were informed by a facetious visitor, are better pleased to "take up" Potatoes than wrongdoers. One great inducement to the cultivation of an allotment is a change of occupation; but the secret lies most probably in freedom from restraint, and the satisfaction arising from successful labour, combined with the sense of ownership so aptly described by Crabbe:—

"It is his own he sees—his master's eye
Peers not about some secret fault to spy,
Nor voice severe is there, nor censure known;
Hope, pleasure, profit—they are all his own."

The allotment gardens at Highgate Rise are among the best cultivated in England, and they reflect the highest credit on both the tenants and those immediately concerned in their management. This result is probably owing to the healthy rivalry induced by a judiciously-arranged prize scheme, carried out persistently, and with the strictest impartiality, under the guidance and help of Mr. Willard and Mr. F. H. Bartlett, the Hon. Secretary.

In addition to informal visits, the allotments are inspected officially three times in the year, and the condition on each occasion is carefully registered. The total number of marks awarded determines the prize. As a general rule from eight to ten kinds of vegetables are grown, with small fruits and flowers. The same careful system of inspection is applied in awarding the prizes for window-gardening. The entries are duly made, and three personal visits paid to each competitor, in order to determine the average degree of merit. The blue ribbon of the Brookfield cottage allotments was won on Saturday, July 24, for the third time, by Mr. Charles Parling, a bricklayer's labourer. His pretty garden was in admirable order and high cultivation. It contained no less than fifteen kinds of vegetables and a delightful little flower border. It must have been an arduous task for the judges to decide between the merits of Par-

ling's garden and those of the second best, Messrs. Williams and Parsons, both of which were in a highly creditable condition.

There is one great advantage in these open plots; each tenant can watch his neighbour at work; and see the results of his labours. It is owing, no doubt, to the intelligence and industry bestowed upon their plots by the aforesaid successful competitors that such a high degree of average excellence is attained. There are two other circumstances, however, which contribute to the result—the abundance and cheapness of manure (which at present may be purchased and delivered at 1s. a load), and a constant supply of water conveniently situated in the centre of the field.

Bee-keeping has lately been started among the tenants. Last year six stocks, with suitable hives and supers, were presented by the Baroness, the only condition being that each owner of a stock should give one swarm, the first, to the tenant having priority of claim.

The annual exhibition of garden produce was held in a tent on the cricket-field near the gardens. The vegetables shown were unusually fine, and there were also creditable specimens of window plants, designs for garden window-boxes, and nosegays. During the afternoon the fine band of the Y Division of the Metropolitan Police performed at intervals, and the show and gardens were personally inspected by the Baroness Coutts. *Echo*, July 29.

TREES AND SHRUBS.

RUBUS PHENICOLANUS.

THIS is a very handsome Bramble, striking at first sight from the shaggy crimson glandular hairs with which it is so plentifully beset, and from which it derives its name (*phoenix*, red, *laxus*, shaggy). The leaves resemble those of the Raspberry, but are of a silvery white on the under surface. The flowers are in terminal panicles, the pedicels and elongated calyx-lobes densely clothed with long crimson hairs, each tipped with a small globular gland. The fruit is about the size of a small Cherry, clear orange-red, shorter than the persistent calyx-lobes. It is noteworthy that while the fruit is unripe and green the calyx-lobes fold over it, and thus protect it from the incursions of birds, while the viscid hairs keep off undesirable insect visitors, but when the fruit ripens the sepals unfold, spreading horizontally, forming a flat dish, on which the fruit is presented for the attraction and appreciation of birds, who after regaling themselves, secure unwittingly the perpetuation of the species by ejecting the seeds. The plant is a native of Japan, and for a specimen of it we are indebted to the Rev. Canon Ellacombe, in whose garden near Bristol it proves to be quite hardy.

PICEA GLEHNII.

We are indebted to Mr. Boehmer, of Yokohama, for a few cones of this Japanese and North-East Asiatic Spruce. The tree was described and figured in these columns in 1880, March 6, from specimens received from Mr. Maries, but it is at present not widely known. We should not suppose it to be a very ornamental species, but as a timber tree it might thrive in cold, wet localities, where the Spruce would not grow. At any rate, it would be worth trying.

GENISTA ANDREANA.

Under this name is described and figured in the *Revue Horticole*, a variety of the common Broom in which the side petals or wings are of a rich golden-brown, which contrasts well with the rich yellow of the standard. Judging from the figure this will make a very handsome addition to our shrubberies. As this is only a variety of the common Broom, *Cytisus scoparius*, we should prefer, for garden purposes, to call it *A. de's* *Cytisus*, for the purer vernacular, *André's* Broom, might be objectionable to our friend's feelings!

SAMBUCUS CALIFORNICA.

Our old friend and colleague, Mr. Thomas Moore, sends us from the Chelsea Botanic Garden a specimen of this Californian Elder, a hardy deciduous shrub, or low tree, of great beauty. The leaflets are narrower, more truly lance-shaped than those of the common Elder, and have a milky appearance, probably due to the profusion of very minute white

scales with which the upper surface is beset. The lower surface of the leaves, like the shoots, is covered with soft hairs, which give a velvety feel to the plant. The flowers are like those of the common Elder, but cream-coloured or pale sulphur-coloured, and are succeeded by black berries, so covered with glaucous bloom as to appear quite blue.

THE BLUE DOUGLAS FIR.

This is the Colorado form of the noble Douglas Spruce, and when well developed is as blue as the Blue Spruce (*P. pungens glauca*), the Picea, or Abies Parryana glaucus of gardens. It is a form well worth cultivating for its ornamental character.

FINE TREES AT MESSRS. LUCOMBE, PINCE & CO.'S NURSERIES.

At these nurseries, near Exeter, the following trees were noted this year:—

- Cupressus sempervirens, 26 feet high.
- Taxus baccata Davostonii, 25 feet high; girth of trunk near base, 42 inches; 15 feet wide.
- Araucaria imbricata, 32 feet high; girth of trunk near base, 5 feet 4 inches; 30 feet wide.
- Cupressus torulosa, 25 feet high; girth of trunk near base, 25 inches.
- Quercus Fordii, 20 feet high; two perfect pyramids, each about 40 feet around.
- Cephalotaxus Fortunei, 15 feet high; girth of trunk near base, 28 inches; 15 feet wide.

This plant was given to the late Mr. Pince by Mr. Robert Fortune, and is reputed to be one of the largest, if not the largest, specimens in Britain.

- Pinus parviflora, 18 feet high; girth of trunk near base, 38 inches; 21 feet wide.
- P. insignis, 50 feet high; girth of trunk near base, 7 feet; 25 feet wide.
- Thuja gigantea, 32 feet high; girth of trunk near base, 4 feet; 15 feet wide.
- Picea excelsa monstrosa, 30 feet high; girth of trunk near base, 21 inches.
- Juniperus pendula, 15 feet high; girth of trunk near base, 25 inches.

- Cupressus Lambertiana, 40 feet high; girth of trunk near base, 7 feet; 40 feet wide.
- Taxus baccata foliis variegatus (the golden English Yew), 15 feet high.

Two magnificent specimens, noteworthy from the fact of being the very plants which won the 1st prize at the great Exhibition at Manchester in 1874, when also Messrs. Lucombe, Pince & Co. were awarded the premier prize for their unique collection of splendid Conifers.

- Juniperus drupacea, 20 feet high; girth of trunk near base, 19 inches.
- Thuipinus borealis pendula, 30 feet high; girth of trunk near base, 35 inches.
- Athrotaxis selaginoides, 10 feet high.
- Chamaecyparis excelsa, 12 feet high; girth of trunk near base, 15 inches; 10 feet wide.

This fine Palm enjoys a prominent position in the rock garden here, and braved the inclement weather of the past severe winter without protection, save that afforded by neighbouring trees and shrubs and rocks. *W. Napper, Alington Cross.*

BOCHYM.

In that distant part of West Cornwall—the stony district of the Lizard—in the parish of Cury, stands the picturesque and historical house and manor of Bochym. A place distinguished for its antiquity and romantic history, moreover, Bochym is often spoken of as “The first and last gentleman’s house in England.” As seen from the coach as it rolls along the road to or from the Lizard, this grand old mansion is a familiar object, surrounded by great numbers of noble trees and shrubs—glimpses of its quaint gables continually arrest the gaze wherever the luxuriant foliage permits it. The landscape at Bochym is lovely—so distinct from the desolate barrenness of the adjoining downs, that the contrast, makes the place all the more beautiful. It was my good fortune to visit this place during the leafy month of June, just past; and I shall not forget the kindness of the owner (Sydney Davey, Esq.), and Mrs. Davey in showing me the gardens and grounds of their ancestral home. The entrance lodge is a pretty feature and from this point the winding carriage drive for a long distance is bordered on one side with a series of fish ponds, shaded by the overhanging trees of the

adjoining woods, their banks effectively planted with marsh plants and *Osundas*. These ponds have been formed by making dams of huge rocks, hemming in the silvery stream which rushes down from the rocky hills hard by. A stretch of land on the other side of the drive is planted with Pines and Firs and other coniferous trees, and deserves the appellation—a Pinetum. There are fine specimens of *Thuja Lobbi*, *Pinus excelsa*, *Abies Nordmanniana*, *Pinus insignis*, *Cryptomeria japonica*, *Cupressus macrocarpa*, *Taxodiums*, and others. Adjoining the house is a commodious conservatory of such an imposing appearance that it becomes in reality a wing of the building. It was furnished at the period of my visit with a variety of flowering plants, Palms, Ferns, and at the further end is a miniature rockery well designed and planted, the jutting crags and boulders affording effective positions for choice Ferns and other plants. Water of course is a feature that has been made much of by the designer. Almost directly in front of the mansion, but some distance off, are the kitchen garden, plant-house, and forcing-pits, the hidden more or less from the house by a number of remarkable terraces and flower gardens dating from a past age. One of these Mrs. Davey was pleased to call her own garden, and which to my mind is no attempt whatever at formal planting or strict training, simply a garden with grassy plots and gracefully serpentine borders, where you could ramble about among Sun-flowers, Poppies, Dahlias, Roses, Salvias, Anemones, and scores of herbaceous plants, and where at most seasons of the year flowers are to be found. Mr. Thomas Dorothy the head gardener, is a persevering and obliging young man, under whose management the gardens of Bochym are likely to be kept in good order. *W. Napper, Alington Cross.*

ARDISIA JAPONICA.

ONE of the prettiest berried plants for greenhouses is one which is made much use of at Kew for decorative purposes. As our illustration (fig. 44), taken from a plant in No. 4 house at Kew, shows, the plant as grown in a small pot forms a dwarf compact shrub with whorled leaves, which are lanceolate, serrulate, evergreen, tapering at both ends. The flowers are white and succeeded by globular red berries, which are produced freely, and form a nice contrast to the dark green foliage. It has the appearance of being nearly, if not quite, hardy.

FRUIT NOTES.

EARLY PEACHES (p. 216).

I CONSIDER Alexander, Waterloo, and Amsden almost identical and possibly quite so; if there is any difference Amsden is inferior in flavour. They are all earlier than Hale’s Early. I gathered Alexander, on July 12, and Hale’s Early, on July 31, from a cold house. Waterloo and Early Beatrice were ripe here outside on July 12 on a south wall. One large tree of Waterloo, 18 feet by 13, was moved out of the early Peach-house last autumn without any soil attached, and has perfected twelve dozen fruit, some of them very fine. This proves beyond a doubt that large Peach trees may be moved with perfect safety, and I consider they are benefited by it.

We were compelled to move every tree in our 180 feet range last autumn in order to put drainage in the borders, which from some unaccountable reason had been omitted when the borders were first made.

These trees have borne much more fruit this year than they did before; one large tree of Early Beatrice was brought from the 100 feet span-house; this measured 20 feet by 13; it was planted on October 13, and has borne fourteen dozen fruit, much finer than this variety generally is. The first one was ripe April 17. *W. H. Divers, Kilton Hall.*

APPLE LEYDEN PIPPIN.

This Apple was exhibited once or twice at the Con-

gress, and in the report is “damned with faint praise.” Here in Scilly, it is one of the most popular Apples, both for eating and cooking, and one of the most enduring of sea winds, is a variety called Box Apple, which appears very like the said Leyden Pippin. It ripens very early in the season, and has a very pleasant spicy flavour and sweet wital. The fruit varies much in bulk, but would be classed as medium-sized. The tree is vigorous and hardly ever fails to bear a respectable yield. It seems a suitable Apple to be planted in gardens by the sea, which are exposed to winds laden with salt spray. Perhaps the light sandy soil of these islands improves the flavour, indeed for early Apples, like Mr. Gladstone and Irish Peach, I am convinced it is especially favourable. *Il Vagabondo.*

GATHERING FRUIT.

Our contemporary, the *Revue Horticole*, calls attention to the desirability under certain circumstances of gathering fruit before it is ripe (*entre cueillage*). By this means, in the case of Apples and Pears, the fermentation and chemical changes go on more slowly and regularly, with the result that the flavour is superior and longer preserved. Winter fruits, on the other hand, should be allowed to hang as long as possible. Even in the case of Peaches and Nectarines our colleagues prefer to gather the fruits before they are ripe, and to allow them to mature in a dark, cool, well ventilated room. The fruits may be covered with thin canvas or even paper; their duration may thus be advantageously prolonged.

BEURRÉ HARDY PEAR.

This is one of the best autumn Pears, of middle size, regular pyriform shape, short stalk, obliquely set, shallow eye, reddish-brown skin, and white juicy flesh, pervaded with a delicate musky taste. It originated as a seedling with M. Bonnet, of Boulogne-sur-Mer. It succeeds best on the Quince. It is well figured in a recent number of the *Bulletin d’Arboriculture*.

COUNT OF FLANDERS PEAR.

This is one of those few Pears in which the seeds or pits are not developed. It is of large size, elongate pyriform, with a short stalk, green or yellowish skin, and white melting sugary flesh. The fruit is in season in December—January, and is of excellent quality. A good figure is given in a recent number of the *Bulletin d’Arboriculture*.

ROSES AT CHESHUNT.

THE name of the old nursery at Cheshunt naturally turns one’s thoughts to Roses, and though the times these scattered notes were taken—at the latter end of July—was late for the tide of exhibition flowers, yet, to see these was not the object I had in view, but rather to have a look at some varieties that have appeared during the last two or three years, and see how they are likely to meet the wants of Rose growers who, in addition to the kinds they cultivate, require them to be vigorous growers, free bloomers, and, as regards the hybrid perpetual varieties, that will give a succession of bloom such as to make them deserving of the name. The ability of new Roses to come up to this standard is not proved until a year or two has elapsed after their first appearance, and they have had time to get over the ordeal that now attends new varieties in the forcing and subdivision that they are subjected to with a view to get up the required stock in the shortest time.

Grandeur of Cheshunt.—One of Messrs. Paul & Son’s new Roses of 1883; it is an excellent variety, blooming early, and keeping on up to November. The flowers are large, colour vivid shaded crimson—in the way of Charles Lefebvre.

Marshall P. Wilder.—Amongst the new varieties that came out in 1884, this was in fine condition; the flowers very large, of good form, the colour being cherry-carmine; a free bloomer, and vigorous in growth. So striking is this variety, that at a distance from the quarter in which it was growing the long rows of colour stood out distinctly from the others growing with it. It is an American variety, sent out by Elwanger, and, independent of its merits as a show Rose, is likely to become as popular as a garden variety as A. K. Williams. Evidently the Americans are not disposed to leave all the plums to the Old World in the raising of new Roses.

Edair.—This is another telling Rose, in shape somewhat globular, petals reflexed; the colour is

vivid scarlet suffused with crimson. Keeps on blooming until stopped by cold weather.

Ella Gordon (W. Paul & Son).—A really fine Rose, globular in shape, and very full; colour cherry-red. Habit of growth free and vigorous.

Comte Benoit.—This Rose was in fine condition. The colour is a peculiar shade of red, brighter at the outer edge of the petals. Growth free and vigorous.

distinct appearance. It is likely to become a favourite, the form of the flowers being good.

Clara Soupert.—A pretty flower, salmon-pink in colour. A free grower, keeping on flowering until the autumn.

American Beauty.—A new American H.P., with a high character. The flowers, which are large, are of a pink colour and fragrant. Evidently it is a

identical in form with Catherine Mermet, having plenty of petals in it.

Sunset is another new Tea Rose of American origin, sent out by Hendetson of New York. This also is a sport, I understand, from *Perle des Jardins*; colour orange tinged with red. It differs from all other varieties, and is a profuse bloomer. A number of plants in one of the houses were covered with

FIG. 44.—ARDISIA JAPONICA: BERRIES RED. (SEE P. 232.)

Of last year's Roses:—

Victor Hugo is a fine variety, crimson shaded with purple, the flowers full. It beats that fine coloured but somewhat miffy-growing variety, *Navier Olibo*. The growth is not quite so strong as desirable.

Pride of Reigate.—This sport seems to retain the character of the flowers as it first appeared, whilst the successional habit of the variety from which it sprung (*Countess of Oxford*) also remains. The colour, white stripes on a pale crimson ground, gives it a

ree bloomer, as small plants on their own roots, received in December, flowered last March.

Grace Darling, H.P.—one of Bennett's Tea-scented seedlings—is likely to be a useful variety for cutting in the bud state; the colour is creamy-white, the petals edged with rose. It is a very free bloomer.

The Pearl.—The new Tea Rose, a white sport from Catherine Mermet, is much liked by Mr. Paul. There is little doubt that it will become a favourite variety for cutting in the bud state. It is all but

to an extent I have not before seen in any Tea Rose. It is an excellent forcer.

Comtesse de Frigneuse, one of this year's new Tea varieties, is evidently a good yellow Rose.

Several promising seedlings raised here have bloomed for the first time this season; they are distinct in colour and general character, and will probably be seen when they have undergone the usual trials here.

CLIMBING ROSES.

Waltham Climber, No. 3.—This seems to have

more Tea blood in it than Reine Marie Henriette. The colour is rosy-crimson; it is very fragrant, and is fitted for a climbing or pillar Rose, having plenty of vigour.

Paul's Single White.—An effective variety, adapted for scrambling over old walls, buildings, and the like. The flowers are single, 2½ inches in diameter, and quite white. Its habit of keeping on blooming is in its favour.

Reine Olga de Wurtemberg—an insufficiently known H.P.—is another remarkable climbing Rose that makes immense growth. The flowers are semi-double, of a bright crimson colour.

Of *Polyantha* Roses, one of the very best, if not the best, is Anna Maria Montravel; the flowers are very full, imbricated, pure white in colour, and produced in such profusion as to all but hide the leaves.

Those who require a Rose that will cover the greatest possible space in a short time should procure *R. Brunonis*, the Neapeuse Drier; when once established in fair soil it will make shoots 20 feet or more in length in a season. The flowers are white, single, and produced in bunches. In its way it is very effective. Amongst other Roses that are not so much grown as they deserve to be, is the North American species *R. lucida*; the flowers are single, rosy-pink in colour. It has beautiful toothed leaves which set off the flowers well.

R. macrantha is another single Rose with a distinct habit. The growth is compact, and it is a free bloomer. The flowers are 3 inches across, white, shaded with blush.

R. anomalaeflora.—A Chinese species; flowers blush, and, as its name implies, confused in the centre. A profuse bloomer.

R. tinophylla plena.—This is another desirable climbing sort, distinct in appearance. Of the numerous varieties of Double Roses we now possess, which are the outcome of many years of care and attention in seedling raising to say anything in their praise is like painting the Lily, but when people have learnt to see the beauty of the single and semi-double species and varieties of which the above-named are a few there will be a chance of Rose gardens having more beauty and interest attached to them than at present.

PLANTS UNDER GLASS.

Amongst numbers of other things in the houses is *Passiflora Constance* Elliott, a white form of *P. corallina*. It seems likely to be a desirable plant. *Solanum jasminoides* grows luxuriantly here. It is singular that this beautiful climber is not often met with; the plants are bearing quantities of flowers, and have been in bloom continuously ever since last November. The form and pure white colour of the flower are such as are very desirable in bouquet flowers.

Amaryllis are largely cultivated; some of the best named sorts are grown, and from them have been raised several thousand seedlings, the bulbs of which are large and strong. There is here a cross between *Valloia purpurea*, and one of the seedling *Amaryllis*; the character of the foliage and form of the bulbs partake of those of both the parents in a way that leaves no doubt as to the origin of the plant.

Calceyone cristata.—There is a fine stock of this. The plants are grown in full light, as they are kept within 6 inches of the roof of the house.

SHRUBS AND TREES.

Hybrid Rhododendrons.—Mr. Paul is trying to break fresh ground in this direction, having crossed a number of the best hardy hybrid kinds with some of the greenhouse varieties. The plants are covered with seed-pods, and in them may be seen the singular effect that the pollen parent sometimes has in causing an increase in the size of the seed-vessels of the plants with which it is crossed. In the case of the *Rhododendrons* in question, the seed-vessels are double the size I ever saw any of the hardy sorts bear where a cross of the ordinary kind has been effected.

Amongst hardy evergreen shrubs raised here there is a distinct and beautiful variety of *American Arbutus*; it differs in habit from the parent species, being of low compact growth, not unlike *Thuya aurea*. It is covered with dense foliage of a deep green colour, and is one of the best of all low growing evergreens for specimens.

Of *Berberis* there are numbers of distinct and beautiful varieties. They are seedlings raised from *B. aquifolia*, but differ so much from it, and from each other, that in the case of some the parentage is scarcely recognisable; in some the foliage is quite

glaucous, and in others different shades of green. The plants from which the seed was gathered were growing in company with other species, amongst which were *B. japonica*, and in all probability it is the pollen of this that has had something to do with the appearance of the plants.

In Junipers, of which there are a number planted, with a view to prove the best, the varieties *J. plumosa alba spicata* and *J. plumosa argentea*, are both fine distinct sorts.

Trees with self-coloured foliage, apart from those of the normal green colour, are now receiving a good deal of attention, and deservedly so, the contrast they afford to the green-leaved kinds forms an acceptable feature in the landscape when they are introduced to the right positions. They are free from the objections attached to some of the variegated trees and shrubs of which we have more than enough, as these latter are many of them very unsatisfactory, either from the effect they produce, or from the unhealthy look of the leaves. So far as can be judged, one of the best picture trees that has appeared is *Van Houttei's Elm*, *Ulmus Van Houttei aurea*; it is a paler shade of yellow than *U. plumosa aurea*, and a better grower. *Prunus Fissardi*, which is of the *P. myrobalana* section, is now getting well known. It improves with acquaintance, and as the tree attains size shows more of its character. It promises to be one of the most distinct purple-leaved half-trees we have. *Acer Reichenbachiana* is a variety of Norway Maple that is as yet but little known. It is an acquisition among purple-leaved trees, and has a beautiful effect in spring; it likewise retains its colour well through the summer. *Acer purpureum* is another of the Norway Maples that is well worth growing, as, like the preceding, its foliage is not only fine-coloured during spring, but remains effective through the season.

Another comparatively new tree, *Populus Boleana*, is in beautiful condition here, thriving as freely as any of the proverbial free-growing family to which it belongs. It has the fastigate habit of the Lombardy Poplar, and in addition has large foliage, white on the under side. So far it would seem as if this tree would in the future take the place of the Lombardy. The new Golden Privet is an acceptable addition to yellow-leaved shrubs, the leaves of which are wholly yellow, retaining their colour well, and it seems a good grower.

The comparatively new *Phillyrea decora* or *Vilmoriniana* is a handsome evergreen shrub, a dense growing sort that when it becomes better known will be preferred to the other varieties. It seems to be hardy.

Eulalia japonica variegata, much grown in pots for decorative use, is also a hardy example that has stood out in the borders here several years, is healthy as can be seen. It is an effective variegated plant for a front position in shrubby borders, where its pretty foliage backed up by green-leaved plants, is seen to advantage. The new *Clematis Jackmanni alba* was in bloom out-of-doors. Promising as this fine variety was when it first appeared, it seems as if on further acquaintance it would turn out even better than was expected. It is evidently a good grower, and a free bloomer. The trace of blue in the flower seems to bring out the purity of the white clearer.

ROCK PLANTS AT BRONX-BURNER.

THE middle of summer is not the time to expect much in the way of bloom on alpine and rock plants generally, but the collection has made good progress this season; most of the plants are now covering the surface allotted to them. Amongst those in flower may be named the following:—*Mesembryanthemum uncinatum*, which was dotted over with its purplish flowers; *Campanula pelviformis*, one of the pale blue sorts, and a good many others of the genus; *Linum cathartense*, one of the most distinct of the blue *Flaxes*; *L. flavum*. The lovely *Cistus florentinus* was covered with white flowers spotted with red. *Tropeolum polyphyllum* was also in bloom. The *Zebra Rush* and the *Corkscrew Rush* are both growing in the artificial swamp here, and are proved to be hardy.

Sarcocolla Drummondii is at home in the swamp, and though its horn-like leaves are small in comparison to what they are when well managed in warmth under glass, still they are perfect in shape, and of a high colour. *Lilium pardalinum* thrives here in the bog garden.

The old double yellow *Provence* Rose grows and flowers freely in a corner of the mound where chalk

debris has been mixed with the soil for the growth of such plants as require it.

There are quantities of beautiful and interesting plants thriving here in a happy-family kind of way, in the nooks and corners that have been duly prepared for them. T. E.

PRESENTATION TO MR. W. INGRAM.

VERY many of our readers have ere this made the acquaintance of the spring garden at Belvoir, which Canon Hole has on more than one occasion styled "the most beautiful garden in all England."

About 5 o'clock on Thursday afternoon, August 5, a numerous company of ladies and gentlemen assembled in one of the most picturesque parts of the garden, not far from Blackberry Hill where the Volunteer encampment was in full swing, to witness the interesting ceremony of presentation. Canon Hole, in a letter regretting his inability to be present, wrote—"No one admires and appreciates more than I do the taste and the labour which have made Belvoir in its vernal glory the most beautiful garden in England; and I need not tell you that I greatly regret my inability to be present on Thursday, when the victorious general will receive on the field of triumph some tokens from those who have watched, with a delightful wonder, his complete success."

The Rev. Canon Twells, in making the presentation, after some preliminary observations, said, addressing Mr. Ingram:—"You sir, would be the first to admit that the grounds of Belvoir Castle have great natural attractions; but those attractions have been increased from time to time by the thoughtful care and attention of those in charge of these gardens, and this has been most conspicuously the case since you yourself have been their responsible head. God has showed us how He can robe the Lilies of the field without human assistance; but God has also showed us how human study and human labour can at once develop and diversify His natural gifts. If all who have experienced pleasure from looking over the Belvoir gardens had given a single penny to this testimonial—as I feel certain they would have done if they could only have been asked—what a present would have been forthcoming! I often think that the beauties of Belvoir are practically maintained by the Duke of Rutland for the public rather than for himself; but while we feel grateful to the Duke for not shutting his gates against us, we are all aware how much of our enjoyment of the place is dependent upon the efficiency, and not only so, upon the kindness of the officials. I have now, sir, to request your acceptance of this testimonial, consisting of certain pieces of plate and a cheque for upwards of £50. May you long have health and strength for the performance of your responsible duties here! To the lover of Nature and of scientific enquiry, we believe that those duties bring with them their own reward; but we are sure they will be sweetened by the knowledge, of which this testimonial is a proof, of the hearty recognition of a large circle of friends.

The inscription engraved on the principal article ran as follows:—"Presented, with a purse of money, to Mr. W. Ingram, by his friends and neighbours, in appreciation of the manner in which he originated and developed the Spring Gardens at Belvoir Castle."

Mr. Ingram, in reply, said:—"Canon Twells, ladies and gentlemen,—I need not tell you how gratefully I receive the handsome gift which you have been so good as to convey to me. I may say that it has been my happy privilege to originate and develop in this place a style of gardening which was not much thought of previously; and I notice, from the inscription on one of the pieces of plate now before me, that this testimonial is intended as a special recognition of the fact that I have originated "spring gardening." Beautiful as this garden may be in the summer, it is, as you are well aware, much more beautiful in the spring of the year. We have gathered together here plants and flowers from distant regions, and I conceive that a garden may be made, not only exceedingly brilliant and beautiful, but also interesting and instructive. It has been one of my aims in gardening not only to make a pretty picture, but also to make a garden tell a story. Even the Cedar on the hill over there, from Mount Lebanon, has a story to tell; and we have only to look round about, and on every side are trees brought from other parts of the world in which we

are interested. Just as England may be regarded as an epitome of the world at large, so our gardens can be made to tell an instructive tale of what we possess and of what we are interested in abroad, by means of those plants and trees which travellers in other countries have discovered and sent home to us. You have made an allusion to gardening being the result of refinement. Travelling everywhere, I have observed that where people are savage and degraded, and we find their country without flowers, and their gardens devoid of a single shrub, or anything beautiful, and in proportion as people are refined and educated, and appreciate beautiful things, so you will see that they cultivate their gardens. I can only express the hope that my poor efforts here may be the means of spreading a taste—a proper and catholic taste—for all kinds of plants and trees. Canon Twells, the gift which you have so gracefully conveyed to me has added value from the eloquent words which you have spoken; and I trust that I shall always retain a grateful sense of your kindness, and of that of all those who have contributed to this testimonial. Canon Twells, ladies and gentlemen, I thank you very sincerely. Condensed from "*Grantham Journal*," August 7.

ROOTS AND THEIR WORK.

(Continued from p. 109.)

ROOT STRUCTURE.

The Root-Cap.—In addition to the compound cell structure of *Lemna* and *Pontederia crassipes* we notice a cap at the extremity. The same cap, though not so evident, exists in roots of most plants as a yellowish hard covering, in some cases, especially among aerial roots (of *Musa*, &c.) there is a flutty growth. (See also microscopic section of *Strelitzia*, fig. 47.) This growth is harder in some Palms, but it is always present.

We notice the root-cap of *Pontederia* magnified, but it is not easy to get sections of the growing point; we see the cells are denser near the extremity, however.

In the roots of seedlings we notice a central darker series of cells, and a more transparent outer part. In the *Wallflower* this central portion is more abundant, and the outer series of cells, also hardened, may be pulled away from it. Where root branches are given off, however, little branches from the harder central tissue remain attached.

This branching of all rootlets from the central more woody tissue is to be noticed throughout [nearly] all roots. In *Pontederia* (see diagram, fig. 45), we notice this branching from the centre in all its stages.

Root-Hairs.—We noticed among the external features of roots that more or less delicate root hairs were nearly always present. The microscope shows these hairs to be projections from the outer layer of cells. They, or the thin-walled surface cells, may be looked upon, then, as the essentials of every absorbing root. A cluster of hairs is present at first just at the neck of [very many] seedlings.

In *Primula Sieboldii*, we see them entirely absent from the very tip, where the root cap is. They are thickest towards the extremity, however, and gradually lessen in number to the upper part of the root.

In plants where hardening of the surface of the root goes on, they of course disappear entirely.

Further examination of the small roots of seedlings shows thin-walled cells at the outside, more thickened cells in the centre; the thickened cells, which among older roots look nearly black through the microscope, have broken rings upon their surfaces. This holds good of every root when seen in section in a young condition, but, as before noticed, there may be a thickened series of cells—a kind of bark, in fact—just at the outside.

Cross (transverse) sections of older roots show as in the diagram of *Strelitzia*, fig. 47, among the harder and denser cells to the centre, several larger spaces or circular [globular] cells. It is through these cells that the fluids most pass, and we may judge from the great amount of central harder tissue, in the *Wallflower* for instance, that the function of this kind of tissue is to carry the fluids necessary for the growth of the leaves.

If the outer series of cells be damaged, for instance in a *Rhododendron* stem or *Pelargonium*, we know that there is no (great) interference with the passage of sap upwards; and this I think proves to us the uses

of the different layers—1, the inner being to give strength and to convey fluids; 2, the outer, where thin-walled, to absorb the watery food.

We must notice how evidently in the diagram of *Strelitzia*, fig. 47, the root-branch grows from the central tissue, and also the softer tissue of its springs from about the same cells, and not, as we might suppose, from the outer softer layer.

We notice no softer pith [meristem] cells in the centre of our older roots; there are exceptions, as for example in *Ruscus*, where the woody tissue is in the form of a ring around, in, and also on very young roots there is pith perhaps because the cells have not thickened up enough.

USES OF ROOTS TO PLANTS.

Special Uses.—We have in considering the various forms of roots spoken of the probable uses for which many of them would be suitable—the strong root for the tall growing plant, the much branched fibrous root for the grossly feeding plant, the wedge-like root for such as need support and grow in crevices, &c.

Some plants require long roots to reach to considerable depths, as in many alpine plants where a stem and leaves 1 inch above-ground may have "40 inches below." This is to ensure that the plant gets a supply of water when the soil and surface of the ground are deeply frozen, and which the sun's heat would not affect, whilst the leaves of the plant would soon wither under its heat, no fresh supply of water coming into the tissues.

A *Statice incana* measuring some 9 inches to the top of its leaves actually measured $\frac{7}{8}$ feet from the neck to the extreme end of the roots. Six of these plants were grown round the edge of a pot, their roots had coiled round and round at the bottom, squeezing the cracks into the "hall." Here, doubtless, the length of the root might be abnormal—it might have grown at the expense of the plant, but evidently the root attains great lengths in its natural home, perhaps enabling it to penetrate among rocks to a fairly depth.

FUNCTIONS OF THE ROOTS.

But we have other than mere variations in the size of roots likely to be of aid in meeting special ends; we have general uses which roots fulfil, which we will briefly mention here:—

1. They support or fix the plants, as we have elsewhere alluded to, and as it is so evident a fact we will not further consider it here.

2. They are the means of supplying most of the [liquid] food necessary to the growth of the plant.

We notice that the leaves wither and dry up if they are severed from the root; they may last for a considerable time if placed in water; but it is evident by this that roots are the means by which plants obtain the large amount of water required by them.

If we take a leaf of *Eucharis amazonica* and place it between dry pressing papers we find, after drying it, that instead of being about one-eighth of an inch in thickness, it will now be less than one-hundredth of an inch. This shows how large a part of most plants is water alone. The solid part left after drying might be burnt to an ash, and we could learn what chemical substance it was composed of. It is very evident that these solid ashes could never travel up the plant or enter into it in a solid form, and they must have either got there [in solution] from the air or from the earth.

ACTION OF LEAVES.

We learn that there is not enough of the substances required for the plant's food in the air, even were the plant capable of taking it in. Carbonic acid gas, however, is plentifully taken up by the leaves, a very large amount of the ash being carbon. The greater part of the other constituent matter is dissolved in water, and so passes from the roots through the cells of the plant, and is so carried up to the leaves, &c.

Water may also be taken in by the leaves, as we know is the case when they are cut off and placed on the surface of water; also one use of a very damp atmosphere in some of our houses for young plants is to supply them with water, or at least not to allow the water already in the leaves to drain away by evaporation.

We might just note here that roots seem to have the power of turning towards moisture or to substances they seem to like to grow in, where also they are generally found emitting more root branches.

We learn also that roots have the power to secrete fluids [when in contact with particles of] the soil; at

times these secreted fluids are said to aid in dissolving solid matter (as marble even) which may be taken into their tissues when so dissolved.

Some roots store up starchy or other matter for the future use of the plant. We may see the swollen growth of the preceding year decaying away as the leaves form, and another reservoir for such starchy matter is built up. There are good examples of this to be met with among biennials, as many *Campanulas* with a thickly developed "first-root" or tap-root.

Dahlia also is a good example, and I expect that *Oxalis hirta* has its root developed for a similar purpose.

Potatoes are about the best example one knows, however, and it is a really marvellous sight to see the innumerable starch granules when exuded from a cut piece, under a powerful microscope; but we have considered Potatoes as branching from (underground) stems, though capable of emitting root fibres as well as buds; they also absorb fluid matter through their exterior which bulbs and corns of *Hyacinth* and *Gladiolus* are, I should imagine, unable to do, by reason of their "coat."

We might by "stretching a point" consider that roots, as the word is understood by horticulturists, of *Drosera*, *Primula* (and *Dodecaheon?*), had another use to perform, that is, to continue the species by budding.

THE MANNER IN WHICH ROOTS PERFORM THEIR WORK.

Bearing in mind the remarks made as to the structure especially, but also of the external features: 0 roots, let us discuss how they perform their varied works in aiding the life of the plant.

1. It is not difficult to see how they act as anchors or supports. The few fibrous roots noticed in the *Pinguicula* and *Drosera*, the swollen tap-roots of *Astragalus* or *Hippocrepis*, the huge branching roots of the Oak or Elm, all plainly tell us by their construction and direction that they support or fix the growths above them. Often the roots of a tree will extend underground as far as the branches do above. There seems a mutual dependence of one upon the other, causing them to grow more profusely, or stretch for further distances as required.

2. As to the absorbing of food by roots.

We have seen that the external tissue of all young roots is soft, and that this young tissue, either of cells alone, or of hairs and cells, is present everywhere in roots, from the moss to the highest tree.

As any soft substance will absorb water when placed in it, so we might assume the soft tissue of the root would do so. We can indeed see coloured water entering into the root-hairs when these are placed in it.

Most plants are not surrounded by very evident supplies of water, and it is here that the longer root-hairs become most useful. They stretch among the particles of soil, and abstract the watery films which we learn enclose all but the very driest particles.

All the solid food elements needed, if dissolved in water, would thus be able to enter into the plant.

We have next to see how such are taken from the root to the leaves, where we know the fluids undergo the necessary changes upon their distribution throughout the plant.

If we consider—1st, the action of a sponge or piece of sugar when placed in water; and 2d, the effect produced by sucking the air from a straw held in water, we shall have a partial clue to the *modus operandi*.

Capillary Action and Pressure of the Air.—We know that in both the cases referred to water will rise above its level in the dish in which sugar and straw were placed. This rising of fluid is due to simple physical laws, depending in one case on the closeness of the particles of sugar for its effect, the water rising up the thread-like openings between the particles, and in the other on the partial vacuum which would be caused by suction necessitating that the water should rise [by atmospheric pressure].

Osmosis.—The cells of a plant, as we saw, are so arranged that watery fluids would rise in or between them as in the sugar, and would be much helped by the evaporation going on from the leaves, compelling its rise, as the suction of water up a straw does. But we often have, as in winter-pruned Ivy, a great surface to be supplied with nutriment, and no leaves to aid in drawing fluids up

the stem. Clearly we have great need for another process by which it shall rise, and this has been found by botanists to be identical with a well-known physical process termed *osmosis*. Roughly, this process of osmosis takes place wherever a denser fluid is separated from a lighter one by any thin-walled substance, such as parchment, when a current will be set up from one to the other until the densities of the fluid on either side are similar.

With the cell wall instead of parchment the cell's denser contents might pass out into the earth, whilst water would be taken in were it not that the evaporation from the surfaces of the plant keeps up a continual inflowing, whilst the currents from one part of the plant to the other are stimulated by the denser contents of cells from evaporation takes place, drawing lighter fluids towards them. This ascent of sap is naturally much more vigorous and *vice versa* in summer, and nearly ceases in winter. Experiments have shown its force to be very considerable.

STEM CUTTINGS AND THEIR ROOTS.

These are mostly fibrous. At times, however, some are specially developed, and grow much in length, and harden very considerably.

If we place a suitable piece of stem in the earth, so that it produces roots, various changes take place at the cut end, as follows:—

1. The pith cells shrink slightly and become discoloured, owing to the decay of the damaged cells.
2. The cells forming the ring around the pith cells

FIG. 45.—ROOT OF PONTEDERIA, SHOWING LATERAL ROOTLETS, WITH THEIR CAPS.

grow so as to produce a ring of warty structure. This is called "the callus."

3. From below this ring or series of warty growths are given off in an ordinary manner a greater or less number of roots. In some cases these roots penetrate through the warty cells, but generally I have observed that they spring from below them.

PROBABLE REASONS FOR THESE CHANGES OF TISSUE.

1. We can understand that the pith cells should decay back where broken—possibly they harden a little—in some cases where a stem is cut at both ends one end may dry.

2. We see the necessity for the woody and fibrovascular cells to be sealed up by some means—as they are by the callus—or else the sap in them would not be properly subjected to the influence which would cause it to spread through the cutting.

3. We have seen that in all root-branches or roots such as these are that there is necessity for some of the denser central tissue entering into their structure. We should then expect that they would (as we saw in *Strelitzia*) start from the thickened layer of cells. These roots push through the surrounding cells in the ordinary manner.

I believe that before much or any root-growth takes place there must be some pressure of the fluid causing tension in the cells of the plant, and this state cannot well be if they are open in the ground or "bleeding."

A knowledge of the preceding facts will, I think, show us why in many cases we should not expect cuttings to strike.

WHAT WILL STRIKE.

1. We should not expect any stem destitute of a fair band of the harder (fibro vascular) cells, either to "callus" or subsequently to emit roots.
2. We should not expect plants having a very

which there was a great amount of woody or thickened tissue (in addition to little outer absorbing tissue) to callus readily enough to allow much change of growth before the cutting decayed.

Naturally we ask ourselves, Can we formulate any rules which will be fairly correct in regard to the chances of cuttings of roots "striking"?

We require the formation of leaf-buds here in addition to the formation of feeding roots. The giving off of fibrous roots we may consider even more likely as were they in a slightly undeveloped state I believe they might grow without callusing of the cutting.

But it will be considerably more difficult for stems or leaves to be given off.

1. A stem requires a pith or central medullary tissue as well as woody tissue. This we have seen is generally absent from roots.

Could the stem-buds, if present or dormant, find enough woody tissue, and also obtain pith perhaps from the outer layer, as they do when branching off from a root-stock, as in *Lysimachia*, we might fairly consider that our root cuttings would generally succeed. That they sometimes callus without producing leaves is a known fact.

LEAF BUDS FROM ROOTS.

An examination of *Primula cashmiriana* and *Drosera* has led me to think that the reason why these roots [stocks] give off leaves so readily, is be-

FIG. 47.—CROSS SECTION OF THE STOCK OF STRELITZIA, SHOWING ORIGIN OF ROOT FROM THE INNER TISSUES.

cause there is no central pith required; the growths are "stemless."

Dodecatheon will produce little rosettes of leaves from every root stock if once the crown has decayed away after flowering. This may not be a fair example of root-propagation, as it may be thought that some portion of a very slightly developed stem would be attached to the upper part of each root and from this leaves were given off.

RHIZOMES.

Wherever there are dormant leaf-buds, as on the rhizomes of *Helleborus* and *Dracena*, there is no difficulty in getting plants from small cuttings, but these are not true "root-cuttings." There are cases, as in *Ipeacuanha*, where stems are produced from annulated root-cuttings, where also there is no pith. It seems rather that we may take it as a fairly correct rule, that where stems are required from our root-cuttings there must be pith. In *Dandelion* and *Dock* when cut across we know there is the power to give off leaves.

We might consider here how universal in the vegetable kingdom is the readiness of certain tissues to emit roots. There must be a trace of a harder tissue than that which exists as an absorbing agent at the exterior of all roots. They are given off:—1, from scales, as in the *Lilium auratum*, *Pinguicula caudata*, and many others; 2, from bulbils borne among the flowers (in *Allium*) or from the axils of the leaves, in *Lily* or *Ranunculus Ficaria*; 3, from soft

FIG. 46.—ROOT OF PONTEDERIA, HIGHLY MAGNIFIED, SHOWING THE ROOT-CAP, B, AND THE ORIGIN OF LATERAL ROOTS FROM THE DEEPER TISSUES, A, A, A.

thick or hard epidermis to root, as the necessary absorption through thin-walled cells could not take place. Nor would the root branches be well able to pierce the epidermis did they commence to bud.

3. We should not expect portions of the stem in

leaves, as Begonia or Bryophyllum : from succulent leaves, as in some species of Echeveria, &c. ; 4, from almost any part of the stems and branches if treated carefully, from the end of Fern fronds, as in Adiantum Edgeworthi ; these organs, developed especially to feed the plant, are very freely given off from the other organs of vegetable growth.

PLACES FROM WHENCE ROOTS GROW OUT.

We are not surprised to see, then, that from many lower parts of stems roots and stems (the latter either ascending or creeping) are given off one above the other very indiscriminately. This can be seen in hosts of examples, from Palm (Phoenix) to bog-loving creeper.

Roots prefer to grow out from places, as in the swollen nodes in stems, where there is more fibro-vascular tissue, and as in the Philodendron, where, though having most of its bundles scattered through

relation to the differing functions of the two organs—stem and root. The one bears flowers and leaves spread out to all the influences of air and light—the other as a general thing chiefly developed to absorb water and food which may pass into the whole plant.

2. As to whether there is any difference in external or internal structure I believe is an undecided point. Internally the cells are, to all less thorough investigation at least, just the same. We certainly find that pith is oftenest present in stems and absent from almost all roots, except as in some trees where they branch from the trunk, the pith being present because growing as continuation of that in stem. This pith (though useful in giving more bulk to the stem, from which the leaves may more readily pass off) is needless to the root.

We can all see that the root is colourless generally, though when growing in the air at times, as in Chlo-

having similar rudimentary structures (in the thin-walled cell), although these may be developed differently according to their functions.

(To be continued.)

BARONHILL.

AMONGST the numerous quaint old country seats in the Isle of Anglesey, perhaps no other, whether for beauty of situation, extent of well-wooded, gently undulating grounds, or salubrity of climate, can compare with Baronhill, the residence of Sir Richard Williams-Bulleley, Bart. This estate may be said to occupy the entire eastern end of the isle, being bounded on two sides by the Irish Sea and Menai Straits, while a straight line drawn from Garth Ferry to almost the very point where that ill-fated vessel, the *Royal Charter*, was wrecked, some

FIG. 48.—HOLLY LODGE, HIGHGATE, THE RESIDENCE OF THE BARONESS BURDETT-COUTTS. (SEE P. 231.)

the softer tissue of the stem, there is yet a concentric layer below the epidermis of more substance, therefore more readily giving off roots.

I may mention that *Lysimachia verticillata* is an excellent example, showing the roots growing from the dense woody ring in the lower part of the stem if cut across, whilst the branching stems have a growth from the seemingly much-coloured pith (resin in the pith?) passing into them in the centre of the woody tissue.

THE DISTINCTIONS BETWEEN STEM AND ROOT.

Lastly, before passing on to consider the bearing of these facts upon cultivation, we will roughly try and note whether we find any distinction between stem and root, so nearly, as we have seen, do they resemble each other.

1. The growth of the stem upwards away from the more damp earth towards the light, stands out in great contrast with the tendency in all roots to grow towards moisture, and as a necessary consequence towards shady or dark places.

This growth in different directions is in direct

rophyton, it becomes green, or hard, brown, and stem-like, with bark on it. The epidermis in many stems whilst green has also breathing places, or "stomata." It is sufficiently evident that there would be no need for these in terrestrial roots, although botanists point out among aerial roots, as in some Orchids and in Mangrove, the marks of similar stomata.

3. As to the power in stems, and the absence of this power among roots, to give off leaf-buds, which we have already referred to somewhat fully, I may add that according to the functions of a root we do not need the presence of leaf-buds, and they are never present in true absorbing roots as we should perhaps restrict the term though whether present in storage roots at all frequently I cannot yet make out.

It is certainly difficult to draw a hard and fast line between these two organs, especially when in so many of our best text-books of systematic botany we read of "roots," and find such able to produce leaf-buds plentifully under certain favourable conditions. I think, however, that the greater number of botanists will look upon roots and stems both as complex structures

years ago, would define pretty accurately the western boundary.

Entering the park from Beaumaris, and almost alongside the once famous castle of the same name, the main drive, which is planted in a most artistic manner with numerous specimens of the rarer trees and shrubs, leads along past the great fountain, flower garden, and rosery, to the capacious and well-built baronial mansion. *En route* many rare Conifers may be seen, amongst which we took particular note of fine healthy specimens of *Abies magnifica*, *A. nobilis robusta*, and *A. nobilis glauca*, the latter in particular being a very desirable form, which for contrast and beauty should find a place in every well-arranged collection. *Podocarpus macrophylla* (wrongly named *P. aurea*) rather surprised us, for a 6 or 7 feet high specimen, abundantly covered with flowers, which contrasted strangely with the long dishevelled foliage, was rather more than we had expected. It seemed in perfect health—which we were glad to see—planted in a semi-shady and semi-sheltered part of the grounds, and in company with numerous fine trees of the Hemlock

Spruce (*Abies canadensis*). This latter is a grand tree for ornamental grounds, and nowhere (Eaton Hall excepted) have we seen it in such fine form or with such a sweep of healthy foliage as in the sheltered spots of this sea-girt park. What impresses the lover of trees most, however, is the gracefully irregular manner in which the finer cut-leaved forms of our various hardwoods are intermixed with the Conifer, thus imparting a remarkably pleasing effect from the toned-down appearance given to the otherwise somewhat stiff outlines of the Pines and Firs. Large, well-balanced trees of the cut-leaved Oak, Beech, Hornbeam, and Maple clearly show that at one time there had been particular favourites, for numerous are the examples of such, and the healthy, well-furnished appearance of which give unmistakable evidence of their having received that care and attention which, unfortunately, is too often neglected in trees of the kind. In many instances trees of 30 feet and 40 feet in height were the same in diameter of spread of branches, with the latter almost resting on the ground—the result of judicious management, but particularly the allowing of ample room at all times for their perfect development.

What a lovely tree is that rarely seen *Catalpa bignonioides*, with its large Lilac-like leaves and terminal panicles of violet-white flowers! Of course every plant will not produce trees of the size to be seen here; the largest has a spread of branches covering 42 feet in diameter, and is about 30 feet in height; but from its deep green leaves and abundance of peculiarly shaped flowers an attempt had best be made wherever a warm corner can be found to establish so distinct and desirable a hardwood. *Buxus balcanica*, with its large, glossy leaves and gigantic stature, stands out in bold relief from the lighter-foliaged shrubs near which it grows, and offers a particularly pleasing interest to the myriads of pure white flowers and light green foliage of a 12 feet wide specimen of that rare and beautiful shrub—*Fabiana imbricata*. There is a notion abroad, and unfortunately it has gained too much footing, that this plant is too tender for ordinary culture; but I believe such is not the case, for all through the Canarian, Sicily, and Anglesey, where frosts nipped hard enough during the past long winter, this pretty shrub thrives well and never was seen in finer form than during the present summer. In planting choose a rather dry, sunny corner, and all will be right, and you will soon have one of the most ornamental flowering plants imaginable, for its culture is simple and requirements few indeed. The *Escallonia* are fine shrubs for large grounds, the beautiful evergreen foliage of any of the half-dozen cultivated kinds rendering them of great value for winter decoration. For seaside planting they are likewise invaluable, some specimens within a couple of hundred yards of the coast looking the picture of health and happiness, with wide-spreading branches that in one instance covered a diameter of fully 20 feet. *Thuopsis delabrata* does well here, a couple of fine bushy trees having attained to heights of fully 16 feet, and with an abundance of bright healthy foliage regularly placed around the stems. Rarely, if ever, have we seen larger or more healthy looking plants of this desirable, and, as yet, somewhat rare Conifer, and we were not a little surprised to notice a fair quantity of cones on the upper branches of at least one of the specimens.

Amongst the Pine tribe the gaunt-looking *P. ponderosa* thrives well, one specimen of which we took particular notice being from 50 to 60 feet in height, with a diameter of spread of branches almost equalling the height. The branches are placed far apart—sure indication of luxuriant growth, and hang downwards, while the old matured cones, with their roughish brown bark, have a gradual taper from base to apex. This fine tree was, at the time we saw it, rendered peculiarly distinct and interesting from the large number of pollen catkins that were visible all over the branches, even the tips of the branchlets were literally loaded with the bright yellow catkins, which were set off to advantage by the intense green of the foliage. We could not help noticing how persistent the old matured cones were on this Pine, those for four or five years back still adhering thickly to the branches, a tuft of the long leaves marking off with great distinctness the division between each year's growth.

Near to this Pine numerous large specimens of *Libocedrus decurrens*—trees of 30 feet high and more—are interspersed with far-spreading Lebanon Cedars and upright-growing Cyresses, some of the latter (*C. horizontalis*) having reached heights of fully 30 feet, with well furnished stems, the whole outline, as is common in this tree, being strictly fastigate. *Ficus excelsa* and the nearly allied *P. Strobilus* looked well, their light silvery foliage being rather a pleasant change from the deep greens and bluey-greens of the tribe generally.

That rather uncommon tree, the Atlantic Cedar, is here in all its grandeur—indeed, we cannot remember having seen larger or more healthy looking specimens anywhere, some of the individual trees

measuring fully 50 feet in height, with a wide and easy sweep of the lower branches, these covering a spread in some instances of upwards of 40 feet. A remarkable difference in the colour of foliage is visible in these trees, some being of an almost Yellow-green, while others were light in the extreme, almost as much so as in the Indian species; but even this tree, again, is subject to great variation in tint of leaf.

Of truly gigantic proportions were some half a dozen trees of *Wellingtonia gigantea*, the produce of seeds sent from California some thirty years ago. Having been allowed plenty of room, the lower branches are thick and spreading, and the stems with a gradual taper throughout. Cones were unusually abundant on these trees, some of the lower branches being weighed down by their numbers and solidity.

When speaking of the Abies tribe we omitted making mention of *A. lasiocarpa*, a goodly specimen of which was growing to the leeward of a handsome cut-leaved form of the Hornbeam. Not often is one the pleasure of seeing anything like a fine plant of this Fir, and certainly the one in question was by far the largest we have yet seen, with light glossy foliage that indicated the most robust state of health

and contentment with its surroundings. Trained against the flower garden wall were several rare shrubs, notably the Oleanifer (*Nerium Oleander*) and *Cytisus nigricans*. The former is rarely seen out-of-doors in Britain, but the plant just referred to has been in its present position for many years, and has repeatedly during severe winters been cut to the ground, yet flourish it will, and judging from the myriads of pretty flowers with which it was adorned clearly proves that it was but little the worse for the trying weather with which it has successfully battled. The *Cytisus* was, in truth, a mass of bloom, about 6 feet square, and well it looked, few plants having a more ornamental appearance when trained against a warm sunny wall. *A. D. Webster.*

AGRICULTURAL RETURNS OF GREAT BRITAIN FOR 1885.

From the Agricultural Department, Privy Council Office, we have received the following summary. The returns were collected on June 4 in the years 1884, 1885, and 1886:—

		AVERAGE OF LAND IN GREAT BRITAIN, ENGLAND					
		Wheat.	Barley.	Oats.	Potatoes.	Hops.	
1884	2,777,000	2,168,800	2,945,363	3,656,483	69,233	
1885	2,878,318	2,257,209	2,940,420	3,175,731	71,577	
1886	2,836,064	2,244,669	3,084,704	3,533,929	69,979	
compared with 1885	Increase	141,211 or 4.8 per cent.	5,259 or 1.6 per cent.	
	Decrease ..	192,254 or 7.3 per cent.	16,650 or 0.7 per cent.	1,250 or 1.9 per cent.	
compared with 1884	Increase	72,416 or 3.3 per cent.	166,338 or 5.7 per cent.	709 or 1.0 per cent.	
	Decrease ..	193,271 or 11 per cent.	11,058 or 2 per cent.	
TOTAL NUMBER OF LIVE STOCK IN GREAT BRITAIN.							
		Cattle.			Sheep and Lambs.		Pigs.
	
1884	6,296,411	10,384,863	9,668,491	26,048,354	2,381,014	
1885	6,597,064	10,337,669	9,907,028	26,521,635	2,403,269	
1886	6,646,783	10,176,479	9,344,924	25,524,334	2,321,557	
compared with 1884	Increase ..	377,644 or 6 per cent.	
	Decrease	208,183 or 1.3 per cent.	338,567 or 3.5 per cent.	517,070 or 2.1 per cent.	366,811 or 14 per cent.	

The Apiary.

LAZY BEES.—Much as I respect Dr. Watts, I have at times had grave doubts of the truth of some of his sacred poetry. In my earliest years, when I read about "darkness, fire, and chains," I thought the good old doctor was rather stretching the matter, and under certain circumstances I have found the following true:—"How doth the little *lazy* bee," &c.; and here again, you see, I differ in opinion from the same learned doctor. I have this year had a stock of bees which have been simply idle. They would not swarm, and they would not go into a super. The hive held nine frames. Last winter, being generously disposed—as of course I always am—I left these same bees the nine frames full of honey, thinking that by this act of generosity they would breed early, and would either send forth a fine swarm, or fill for me a good super. I did not want a swarm, but being very loyal, I thought I would have a gigantic jubilee super, and I intended sending this jubilee super as a present in a certain direction, being ambitious enough to wish it to stand on the dinner-table of Windsor Castle itself. But man proposes. I got me a terrible glass super, 20 inches in diameter, and fixed it over the bees. I got holes drilled in the glass so that the bees should not be suffocated, and put some thin foundation for them to have less labour. When the weather was cool I covered them up warm, and when it was hot I ventilated them. But these stifle-necked bees played me horrible pranks. Sometimes they would go up into the super in shoals, and take

honey up there too. Then would they see fit to take it down. This went on all the summer, and roused my indignation to such a pitch that I vowed summary vengeance.

Therefore about a week ago I went to this hive and dealt them a fearful volume of smoke. Then I took off the huge jubilee super, removed the hive on one side, stood the super in its place, and after dealing smoke still more fearful in quantity than before I took out every scrap of honey (nine frames completely filled), and I put the bees into the super, which now formed the stock hive. I just gave them a bottle or two of syrup by means of a special contrivance, and they have done more in one week than in all the summer before. The bees are bringing in pollen and honey, and the queen is very busy also. As I did this in good time there is little doubt but that the bees will get enough food for winter even now. Some may say that the bees will not live in glass hives. I would refer them to a previous article of mine on glass hives. I think I have cured these lazy bees of their bad habits, and got, say, 32 lb. of honey out of them. Go thou and do likewise. *Water Chilly, Feveay.*

The Herbaceous Border.

CAMPANULA MACROSTYLA.

MR. MOORE sends us from the Botanic Garden, Chelsea, specimens of this remarkable annual Campanula. The plant is 1-2 feet high, of rather straggling habit, from the distance between the long spreading branches. The upper leaves are sessile and lanceolate; the flowers are borne in loose terminal cymes, each flower measuring about 2½ inches across, and provided with a leafy calyx of five lance-shaped segments, with ear-like processes at the base, as in the Canterbury Bell. The corolla-tube is broadly bell-shaped, as long as the sepals, the limb spreading into five distinct or broadly triangular segments of a bluish lilac colour, while the interior of the tube is white, with a network of violet veins. The stamens are shorter than the corolla, with long-pointed purplish anthers, which ripen off and disperse the pollen before the stigma of the same flower is ripe for impregnation (protandrous). The style protrudes beyond the corolla in the form of a stoutish column, dividing at the end into three broad, strap-shaped divisions as long as the style itself, but of a dull purple colour. The upper or inner surface is smooth and shining, the lower or outer surface being the true stigma. These stigmatic lobes are usually erect, and applied one against the other, forming a spindle-shaped termination to the style, but sometimes the three stigmas separate more or less widely.

Those interested in the ways of flowers and their "goings on" with insect visitors, will probably find this flower worthy of their attention. The plant is an annual, and is strikingly handsome, quite apart from the peculiarities of its floral structure and the interest attaching to its habits of life. There is a pink variety called *rose-flora*, which does not seem to differ, except in the colour of the flowers.

The plant was introduced in 1877, and was noticed in our columns, October 26, 1878, as requiring a warm, light, and rich soil, in a sunny position.

The Flower Garden.

CUTTINGS OF EVERGREEN SHRUBS.

CUTTINGS of evergreen shrubs may now be put in, beds being prepared for them in a shady situation. A little river or other sand and leaf-mould should be worked into the natural soil. Cuttings of the younger wood should be chosen; these may be from 4 inches to 1 foot in length. They should have the leaves removed from that portion of the wood which is inserted in the mould only; the tops should not be removed. The soil should be kept moderately moist and shaded sufficiently to keep them from becoming flaccid. A few rods stuck in the ground and bent over the beds to support a mat or evergreen boughs will serve the purpose. The shading should only be allowed to remain on when the sun is shining, but at all other times the beds should be exposed to light. When Conifers are raised from leading shoots, or the tops of seedlings, they will make, in most instances, handsome plants, in some cases, as in *Araucaria*, better furnished plants than seedlings, and which, in the young state especially, are useful for many purposes.

PERENNIALS AND SEEDS.

Advantage should be taken of wet days for planting out hardy perennials, such as Wallflowers, Sweet Williams, Sweet Rockets, Campanulas, Lunarias, &c., but if the weather should prove dry the operation had better be deferred a little longer.

Flower seeds, whether of annuals, biennials, or perennials, should be speedily gathered after they become fit, and ere they are shaken out of the seed vessels by the wind. Unless the species be rare or curious, seed sowing is scarcely worth the trouble, as most perennials propagate freely from cuttings or subdivision. Any ordinary species of any of the above can be purchased much cheaper than they can be saved.

ROSES.

Roses will require constant attention with manure-water. Fading flowers should be removed ere the

petals are shed, as they blow a considerable distance over the surface of a smooth lawn or gravel walk and impart an untidy appearance. *Wm. M. Bullie, Luton Hoop Gardens.*

THE ORCHID HOUSES.

EAST INDIAN HOUSE.

THE *Acerides* and *Saccolabiums* in this house are best potted in the spring, and those grown on stages should be arranged so as not to be obliged to interfere with them during the growing season. If we can endure the sight of a few dirty pots it is all in favour of these plants, with such rambling roots, not to be turning them about every week, as the tips of the roots are sure to get injured. Should the sphagnum in which they are potted be getting bad on the surface it should be taken away, and the pot top-dressed lightly with some which has been freshly gathered. In potting *Acerides* and *Saccolabiums* it is not good practice to bury all the roots. Some growers might do so for appearance's sake, but the plants pass much safer through the winter if the roots are left exposed, as the plants are then not so likely to get spot or to lose the bottom leaves. Now flowering in this house is *Pachystoma Thomsonianum*, a very pretty little Orchid not often met with; it grows very well on the north side suspended near the root, and should be supplied with plenty of water whilst growing, but very little after the leaves drop off. *Angræcum Kotschyi* is a very slow growing plant. The best place we can find for this at present is at the dry warm end of this house, grown in a hanging cylinder; it delights to root on the dry wood, and refuses to grow in damp moss or peat. *Vanda Saenderiana* is growing suspended at the coolest end of an East Indian house which stands north and south; it is now sending out spikes freely. Several plants of this species are as interesting as *V. tricolor*, varying like this variety in their shades of colour and markings.

CYPRIPEDIUMS.

Those that are well rooted might be improved by putting them into pots a little larger than those in which they stand. In the compost for these, I like to add a few lumps of light yellow loam, choosing that which has but little fibre, and not breaking the lumps too small; this keeps the plants sweeter at the roots than when so much peat is used.

DENDROBIUMS.

Many of these will now begin to finish up this season's growth. It is not necessary with us to place *Dendrobium* in fruit-houses to mature their pseudobulbs, as the house they are grown in is about 40 feet long, and we can vary their treatment in this house. Those plants that have made their growth are placed at the cooler end here, giving plenty of top ventilation, also at the bottom; and in the other half of the house we keep the top ventilators closed, with plenty of moisture about when the weather is bright. Where *Dendrobium* are grown in the East Indian and Cattleya house, it is necessary to place some species in an atmosphere that will induce them to ripen, and not start a second growth, and a very good place for this purpose is a lateinery where the Grapes are colouring, in which the season is past for shutting up and damping down. If the laterals on the Vines are thinned it will suit the Orchids better, and care should be taken not to remove the plants too early from their growing quarters when they appear to have finished, but rather place them where they will receive more sunlight for a time. It must not be forgotten that *Dendrobium* are very active in making root at this time of year, so that a sudden change of treatment will give them a severe check that may cause the pseudobulbs to shrivel, and when taken back into the warm house again they start to grow, instead of flowering. If the plants are placed in ainery they should be watered once or twice a week to prevent their roots from perishing, using the same kind of water the plants have been accustomed to.

GENERAL DIRECTIONS.

Now that *Coleogyne cristata* is beginning to form its new bulbs it will take plenty of water; but be careful not to let any fall into the growths. This Orchid is growing here in different houses, but those in the Cattleya-house do best. During the present month the temperature in the East Indian-house should not fall

lower than 70° at night, and the intermediate-house be kept at about 65°, keeping a little bottom ventilation on for the Cattleys. *C. Woolford, Downside.*

PLANTS AND THEIR CULTURE.

PLANT HOUSES.

THERE is no time in the whole year so suitable for these structures to be thoroughly examined and repaired as the present, as the inmates can be temporarily placed either out-of-doors or in pits and frames. Cut off blooms of Everlastings as they approach their full size, for if left on beyond that period the flowers lose colour and the petals drop. The best of the ornamental grasses must not be overlooked; these will be found useful in house decorations, as the flower-heads when tastefully arranged, give an elegant finish to the design. *Stipa pinnata* and *S. elegantissima*, *Paspalum elegans*, *Gymnoxithrix latifolia*, *Coix lachryma*, *Eragrostis elegans* and *E. papposa*, *Eulalia japonica zebrina*, *Brizia* in variety, and *Bromus briziformis*—if none of these have been grown for the purpose there are numerous sorts that are common in our woods and on roadsides that almost equal them for elegance. They should be gathered when dry, placing them in an upright position in an airy room, using for the purpose of holding them together large glasses or flower-pots. If the common Bryony be looked after now, and the shoots pulled out straight, there is little difficulty in getting long useful herried lines for festooning, at Christmas time when decorations with berries are very appropriate. *Physalis Alkekengi* is another hardy berried plant that can be used with good effect.

PROPAGATING.

Cuttings should now be put in of such stove plants as are required. I refer to such subjects as *Franciscas*, *Ixoras*, *Dipladenias*, *Toxicophlax spectabilis*, *Vincas*, *Clerodendrons*, *Allamandas*, *Kondeletias*, *Aphelandras*, *Hoyas*, *Hibiscus*, &c. The cuttings should be put into small pots singly, using peat with plenty of sand, and the more robust sorts should have a soil that is somewhat nutritious put at the bottom of the pots, as they will have to stand the whole of the winter in them. The advantage of striking the above in the autumn instead of the spring is, that they have a good start, and will bloom much earlier and freer than later struck plants. Of fine-foliage plants, which may with advantage be put in now, are *Cissus*, *Pothos*, *Crotons*, *Sonerilas*, *Papavomas*, *Spherogyas*. The different varieties of *Nerium* should be seen to; these require to be kept very moist; they may also be struck in bottles of water, in which they root freely. The sweet-scented *Verbena* (*Aloysia citrodora*) strikes more freely now if the cuttings taken off are not too much matured; get in all the cuttings procurable of *Poinsettia* and *Euphorbia jacquiniiflora*, Fern fronds should be laid on pots or pans of soil with a glass over them. *A. Evans, Lytch Hill.*

FRUITS UNDER GLASS.

POT STRAWBERRIES.

THE young plants which were layered into the fruiting pots early in July should be detached forthwith from the parents, and the pots be stood on brick walls enclosing Vines, or other similar places, or on coal-ashes, in any situation well exposed to the south and west, so that the plants have the benefit of the sun-heat to ripen their crowns, without which a satisfactory crop next spring cannot be ensured. Continue to give the plants, when established, liberal daily supplies of weak liquid manure until they have completed their growth, towards the end of next month, and with the object of concentrating the energies of the plants to the formation of large and, as already stated, well-ripened crowns, remove all runners, and any small crowns that may spring from the principal ones as soon as they appear.

VINES.

These, in every stage of growth, should have abundance of air admitted during sunny weather, and a dry rather than a humid atmosphere should be aimed at day and night. Keep the water in the pipes sufficiently warm at night to prevent the temperature from falling below 65°, and at 75° by day in houses containing thick skinned varieties of Grapes, such as *Lady Downe's*, *Black Alicante*, *Mrs. Pince's Black Muscat*, *Gros Colmar*, *Gros Guillaume*, *Gros Maroc*, and *Chiswick Seedling*, so as to get them well ripened by the middle or end of next month, otherwise they will not keep well. *H. W. Ward, Longford Castle.*

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY,	Aug. 23	Special Trade Sale of Dutch Bulbs, at Frothero & Morris' Rooms. Sale of First-class Dutch Bulbs, in lots to suit the Fancy, at Stevens' Rooms. Royal Horticultural Society's Meetings of the Fruit and Floral Committees, at 11 A.M.; also Cottagers' and Artizans' Show.
TUESDAY,	Aug. 24	Shows at Reading, Battle, and Harpenden. Clearance Sale of Stove and Greenhouse Plants, at Clarence House, Clapham Park, by Frothero & Morris. Sale of First-class Dutch Bulbs, in lots, at Stevens' Rooms. Shows at Wickham.
WEDNESDAY,	Aug. 25	Special Trade Sale of Dutch Bulbs, at Frothero & Morris' Rooms. Shows at Sande, Bedfordshire.
THURSDAY,	Aug. 26	Special Trade Sale of Dutch Bulbs, at Frothero & Morris' Rooms. Shows at Sande, Bedfordshire.
FRIDAY,	Aug. 27	Sale of Imported Orchids, at Frothero & Morris' Rooms. Special Trade Sale of Dutch Bulbs at Frothero & Morris' Rooms.
SATURDAY,	Aug. 28	Sale of First-class Dutch Bulbs, in lots, at Stevens' Rooms.

STERN utilitarians of the GRADGRIND school have been known to scoff at the fancies of the florists, or at best to look with an eye of pity on the labours of the rosarians, the tulipomanics, and other members of the floral fraternity. "Very pretty," is about all they can express when brought into contact with the tuberous Begonias of the present day, which did not even exist ten years ago! "Ah, very nice!" is all they can say about the Pelargoniums, which SWEET himself would not recognise now-a-days could he but see them. And so with most of the productions of the florist.

Not only the members of the GRADGRIND school, but even the public in general, have little or no idea of what they owe now, still less of what they will owe in the future, to the patient labours of the experimentalist. An apology is sometimes made for horse-racing on the score that it encourages the breeding of horses, and secures the progressive improvement of the race to which the noble animal belongs. Perhaps it does; we are willing to admit that it may do so, for in this particular we have a fellow feeling with the horsey ones. We know for our own parts that the fancies of the experimentalists have led in the past, do now, and will increasingly in the future, lead to results which must in their consequences materially benefit the whole race of mankind, even though now they seem only to satisfy the whims and caprices of the specialists. Whatever the utilitarian may think of Pansies and Auriculas he will not refuse his sympathies to the labours of the agriculturist. He can appreciate their present and prospective value, and he has been known even to quote, without, however, knowing much about it, the advantages of combining science with practice—the good easy man being unaware that good practice and good science are really inseparable—necessary components of one whole. Possibly our friend may have heard the adage that "Horticulture is the parent of agriculture," and remembering the Garden of Eden and the pastoral and agricultural results that followed upon the expulsion of our first parents from that paradisaical retreat, he may be inclined to admit its truth, but it has scarcely occurred to him that the adage is as true now in this nineteenth century as ever it was. It has not come home to him that the labours of the physiologist and of the gardener, of such men as DARWIN and KNIGHT, and the host of experimenters and raisers of new Peas, new Strawberries, new Pears, and so forth, are of any importance to him as a man of practice. The gardener knows better; he knows it so well indeed that he takes it as a matter of course. To him hybridisation, cross-breeding, selection, are things of everyday occurrence. He knows that he owes his best Broccolis, his choicest Potatos, his most esteemed Grapes, to one or other, or both, of these practices; he adopts the results as they come to him, and as they suit his purpose, and he is eagerly on the look-out for future improvements from the same sources. Once get the practical man (as he calls himself, but with

scant reason) to see this, and he will no longer be disposed to scoff at practices from which so much has been done in the past, from which so much may be expected in the future.

Up till lately selection and hybridisation have been chiefly practised by the florist, with what results our exhibitions testify. The seedsmen have followed suit, as their "improved selections" and "new strains" of garden vegetables show; now, at last, the agriculturists are beginning to find out that it is worth their while to ascertain whether the same procedures which have wrought such marvellous results with the florist may not be of use to them also. It is, however, hardly just to the seedsmen to give agriculturists the credit for this, as it is really mainly to the seedsmen that the advance is due.

Two special illustrations occur to us as we write, but they are only two among many, of the tendency to employ the methods of experimental science to the furtherance of agriculture. We allude to the experiments carried out at Reading by Messrs. SUTTON in the case of the POTATO, and to those of Messrs. CARTER, at Forest Hill, in the case of WHEAT. Space does not permit us now to enter into detail as to either of these interesting series of experiments, but we may find another opportunity of alluding to them. In the meantime we may refer to our article, October 25, 1885, for a general account of the numerous experiments undertaken by Messrs. SUTTON. In that article—to cite only one case—we narrated what the "magicians of Reading" had been enabled to do with the Solanum Maglia, or the DARWIN Potato, and we pointed out that even at that time the Solanum Maglia was much more nearly related to the ordinary cultivated Potato than the plant figured as *S. tuberosum* by Mr. BAKER. The question has been taken up also by the veteran botanist, M. ALPHONSE DE CANDOLLE as we had recently occasion to remark (p. 176). After another year's cultivation Messrs. SUTTON have been able to show experimentally a further advance. The distinctions between ordinary tuberous and the so-called Maglia have been, not wholly but in great measure obliterated, and at any rate the presumption that the Maglia form was the parent of our cultivated Potatos has been greatly strengthened. *S. Maglia*, to speak broadly, has been converted in a great measure into *S. tuberosum*. Botanically it comes to this, that there is but one species, of which there are several forms, differing according to climatal and other considerations. These forms not only interbreed but their characteristics are more or less interchangeable, and may be made to interchange by the art of the cultivator to his own advantage.

"Well, what if all this be true?" says the practical man. "Of what use is all this to us? Very interesting to men of science, no doubt, but of no value to us." Here we join issue. We believe every fact, proved to be such, is or is capable of being either directly or indirectly beneficial to those who know how to apply it aright. At any rate, in the present instance the practical interest lies in this, that the Maglia from Chili is harder than the forms derived from the Andes, and in all probability better adapted to our climate.

Traces of the wildness of Maglia may be recognised in the statement of Sir JOSEPH HOOKER, that for some years after its introduction to Kew it produced no tubers at all, though it does so now; and similar evidence is forthcoming at Reading in the fact that the tubers are not produced "at home," as the phrase goes, *i.e.*, that the stolons are not short but long, and produce their tubers at a relatively long distance from the centre of the haulm; and, moreover, these same stolons, instead of confining themselves to producing tubers, end in long shoots

like suckers, which throw up new haulms like Strawberry runners. We are not sure that Messrs. SUTTON will thank us for revealing this rather undesirable peculiarity of their Maglias, but as they are not likely to "send them out" before they have been civilised into good behaviour there is no indiscretion, in the interests of science, in mentioning the fact. In the meantime it is certain that Messrs. SUTTON have very materially broken down the barriers between the so-called *S. Maglia* and *S. tuberosum*, and at present we cannot fully appreciate what the precise consequences of such iconoclasm may be; suffice it to say, from the experiments in general, that the constructive elements promise to outweigh the destructive ones, and induce us to look forward with firm confidence to results of much future practical value.

Adverting now to Messrs. CARTER'S experiments on CROSS-BRED WHEATS which are being carried out under the superintendence of Mr. SHARMAN, at Forest Hill, we may point to them as affording excellent and hopeful illustrations of the benefits which will accrue to the agriculturist from the adoption of methods long familiar to the florist and raiser of new plants. Why agriculturists have been so slow to see the advantages of the plans followed by their gardening friends, and so chary of adopting them, is a mystery to us. Be this as it may, however, farmers and those interested in physiological questions connected with cross-breeding, may find much to interest them just now at Forest Hill. Those who know the structure of the Wheat flower, and its tendency to self-fertilisation, will appreciate the care and nicety required in effecting cross-fertilisation. The glumes have to be separated at a very early stage, the anthers cut away, and the pollen applied to the stigma—a procedure that occupies at least an hour for each ear operated on. One main object of Messrs. CARTER has been to raise a variety of Wheat which, while possessing other desirable characteristics, shall ripen its grain more quickly than the ordinary kinds. How important this may be in our climate no one will fail to see.

It was obvious also how destructive birds are, and it was curious to observe that, in addition to the use of muslin bags and nets to keep the marauders off, attempts were being made, and, as it seemed, successfully, to breed varieties with close-set, sharply-pointed glumes, sufficient to keep intruders at bay. Attempts are also made to secure short, thick, well-set ears, rather than long ones, in order that there should be proportionately greater produce in less space, so that, amongst other advantages, there should be less tendency in the straw to become laid by wind or wet.

Messrs. CARTER have so arranged that rows of the hybrid WHEATS are placed between similar rows of the parent forms—male on this, female on that side; hence, the visitor may see for himself, and contrast the characters of both the parents and of the offspring. Moreover, they have collected the grains (berries the corn factors call them) from both parents and from the cross, and kept each apart, so that the visitor has all the facts before him. It is interesting to note that while all the varieties show flower about the same time (all the 120 varieties were sown on the same day, October 20), yet that there is very great difference in the time of ripening, and that while the male parent seems generally to influence the colour and the form of the grain, the female parent governs the general form of the plant and of the ear. We do not profess to be able to assess the probable practical value of the results, but we can testify to the very remarkable results which speedily make themselves apparent, in stature, earliness or lateness of ripening, size, shape, colour of ear and

grain, smoothness or hairiness of chaff, and many other points. Two things especially struck us in these cross-bred Wheats—one the increased robustness of the hybrid offspring, thus amply confirming DARWIN'S views as to the advantage of at least an occasional cross; and next the look of superior refinement and improved caste, if we may so say, in the hybrid grains. On the ground we were told that these appearances were not deceitful, but that Mark Lane factors, daily accustomed to inspect and handle samples, recognise superior quality, and detect better milling properties in some of these cross-bred productions of fine outward appearance.

We may then conclude, as we began, by urging our great seedmen to continue to follow the practices of the gardener and of the florist, confident, from our own daily experience, that the procedures that have wrought such wonders in the one case will be no less productive in the other.

— **INJURIOUS INSECTS.**—MR. JAMES FLETCHER has addressed to the Secretary of the Canadian Department of Agriculture, Ottawa, an interesting and valuable report on the insects injurious to crops of various kinds, with the remedies appropriate in each case, following thus in the lines of Miss ORMEROD and of Mr. WHITEHEAD in this country. The difficulty now-a-days is not so much in supplying trustworthy information, but in getting people to avail themselves of it.

— **THE FEDERATION OF BELGIAN HORTICULTURAL SOCIETIES.**—Many of us know well the zeal and energy our late friend, Professor MORREN, bestowed on this Association, as on so many others of a similar character. The Federation has also lost the services of M. AMÉROSE VERSCHAFFELT. These are very serious losses, but we congratulate the Federation on filling up the vacancies by two such competent men as Count KERCHOVE, of Denterghem (Vice-President), and M. LUBBERS, of the Brussels Botanic Garden, as Secretary.

— **FRINUS PISSARDI.**—MR. FOSTER, of the Nurseries, Stanmore, sends us some branches of this fine hardy ornamental tree laden with fruit. The leaves are of a deep reddish-purple, and the globular fruit is of a similar but lighter colour, and of an agreeably acid flavour. The tree evidently takes rank not only as a first-rate ornamental tree for the sake of its foliage, but is by no means despicable as a fruit tree.

— **VEGETABLES.**—M. VAN HULLE counsels us if we would preserve the flavour of our vegetables not to wash them before cooking, if it can be avoided. The vegetables, whether leaves, beans, or roots, should have the dirt removed with a brush or a cloth, or if washing be indispensable, it should be done rapidly immediately before placing them in the saucepan.

— **THE "BOTANICAL MAGAZINE."**—The plants figured in the last number of the *Botanical Magazine* are:—

Kanunulus Lyallii, t. 6888.—The stately New Zealand species, with bold peltate leaves and panicles of large flat white flowers, figured in *Gardeners' Chronicle*, 1885, vol. xxiii., p. 351, fig. 67.

Iris Milioti, FOSTER, t. 6899.—A north-west Himalayan species, originally described in our columns by Professor FOSTER, 1883, vol. xx., p. 231. It has lilac flowers, the keel on the sepals or falls being deeply serrated, so as to form a link between the imbricated and the bearded Irises (Cambridge Botanic Garden).

Cointhe minor, t. 6890.—A hardy Boraginaceous plant, with sessile cordate leaves, and arching clusters of yellow bell-shaped flowers intermixed with the leaves.

Disa atropurpurea, t. 6891.—No fewer than 100 species of *Disa* are, it is said, described. The present has narrow linear pointed leaves and solitary rosy-lilac flowers on the ends of erect flower-stalks. Each flower is about 1½ inch in greatest length.

Ribes exocanthoides, t. 6892.—An American Goose-

berry, and one which Sir JOSEPH HOOKER recommends as well worth cultivating for the sake of its fruit. The clustered berries are globular, lilac, and of the size of small Cherries. It is described as an unfailing cropper, flourishing when the ordinary Gooseberry flags for want of moisture.

— **FROUDE'S "OCEANA."**—Many readers of this attractive book will be interested in the accounts incidentally given as to the vegetation, especially of New Zealand. The author is no botanist, and he indulges in popular or rather vernacular names, which are exasperating, as they convey to the lover of plants no indication of what plants are really meant. Enquiries have reached us as to some of these, such as the *Ti*, which is none other than *Cordyline* (or *Dracena*) *indivisa*, and *C. australis*, so well known in our greenhouses. The *Pobutukawa* trees, of which so remarkable an illustration and description is given, is *Metrosideros tomentosa*. A reference to HOOKER'S *New Zealand Flora* would have enabled the author to furnish the botanical as well as the vernacular names, to the satisfaction of botanical readers. If in literary matters an author were to follow on the same lines as Mr. FROUDE has done in matters botanical, what would that very censorious critic say? We do not expect literary men to be botanists or gardeners, but when they profess to give information on topics interesting to those classes of the community they should take pains to make it correct by reference to easily accessible books, or by availing themselves of the services of some specialist.

— **ILLUSTRATIONS OF THE FODDER GRASSES OF THE PLAINS OF NORTH-WESTERN INDIA.**—This is a series of forty "Nature-printed impressions" of grasses, produced by Mr. T. D. BONA, of Rourkhee, and issued under the superintendence of Dr. DUTHIE. The botanical analyses have of course to be drawn in the ordinary way. The illustrations suffice to give a rough general impression of the plant, which is supplemented by botanical details drawn in the ordinary manner. The "habit" of the plant is well preserved. The descriptive text will be issued subsequently.

— **BAILLON'S "HISTOIRE DES PLANTES."**—The last part of this useful publication contains an account of the order Aristolochiaceae, which are included Nepentheaceae, a collocation which will surprise many, though they may not be so startled to find *Rafflesia* and *Cytinus* under the same heading. Cactaceae, Mesembryanthemaceae, and Portulacaceae are also treated of with, by fancy, rather less than M. BAILLON'S usual elaboration, perhaps from the necessity of bringing the work to an earlier conclusion.

— **"ILLUSTRATIONS OF THE FLORA OF THE PACIFIC ISLANDS."**—M. E. DRAKE DEL CASTILLO has recently published the second fascicle of his *Illustrations* containing twenty lithographic plates, with accompanying descriptions of the plants of the Pacific Islands, Tahiti, the Society Islands, the Sandwich Islands, &c. The work will thus supplement the information already collected by SEEMANN, HEMSLEY, and others.

— **"A PRACTICAL TREATISE ON THE GROWING AND CURING OF TOBACCO IN IRELAND"** (Dublin: M. H. GILL & SONS).—Our readers will remember the discussion that took place in our columns at the beginning of the year on the culture of Tobacco in these islands, and those interested will find further details in the little pamphlet above cited. The objection raised, that it is an exhausting crop, is met by a proper system of rotation, and by the circumstance that the plant does not occupy the ground for more than four months. The difficulties of the curing process seem to us, however, more formidable. It is doubtful if the Irish growers would give an equal amount of care as the Americans do. The pamphlet before us contains a large amount of very useful information on both culture and curing.

— **TOBACCO CULTIVATION AS A FIELD CROP IN ENGLAND.**—MESSRS. JAMES CARTER & CO. desire us to announce that their acreage crop of Tobacco (growing within 10 miles of London) in seventeen kinds, is now ready for inspection, and cards to view can be obtained without charge from them, with particulars of the locality in which it is being grown. They are also prepared to make

special appointments to accompany any one interested in the subject who may wish them to do so.

— **GHEENT HORTICULTURAL SOCIETY.**—At the usual monthly meeting the following plants received the Certificate of Merit:—*Pothos nigricans* and *Lalichia Malouana*, shown by M. Linden, of the Compagnie Continentale; *Begonia Madame Louis Desmet*, shown by M. Louis Desmet; *Pescatorea Lehmanni*, shown by MM. Vercaet & Co.; *Ctenokawia Kirki*, shown by M. L. Van Houtte; *Begonia Arthur Malet*, shown by M. Godefroy-Lebrun, of Argenteuil. Commendations for merit or novelty were given to the following plants:—*Miltonia Kegnelli var.*, shown by MM. Boilens Frères; *Begonia*, tuberous, *Le Flambeau*, shown by M. Arthur Desmet, of Lelebourg; *Cyrtipedium cænanthum*, shown by M. Van Geert, père; *Caragata Andraena*, shown by MM. Jacob Makoy & Co.; and *Cyrtipedium Roelbelii*, shown by MM. Vercaet & Co.

— **CHINESE PLANTS.**—MESSRS. F. B. FORBES and HEMSLEY have published in the *Journal of the Linnean Society* the second part of their "Enumeration of Chinese Plants." The list will be most serviceable, and will be the more useful, as most complete it will form a separate volume. The present part brings the enumeration down to Leguminosæ. The introduction will doubtless contain a bibliographical summary of what has been written on the Flora of China.

— **"NAMELESS ROSE."**—What is in a name? Here is a Rose specifically distinguished by the "nameless Rose." We suppose that a Rose without a name at all might smell as sweet as if it were called by some other name than Rose.

— **NEW TERRORS FOR ORCHID GROWERS.**—Herr WAHRICH has lately described in the *Botanische Zeitung* (July 16, 23) various fungi affecting the roots of Orchids. We hope on a future occasion to give further particulars as to these new pests. It would be interesting if it should prove that some of the forms of spot on the leaves were connected with the presence of fungus in the roots.

— **ALOCASIA (?) LINDENI.** *Illustration Horticult.*, t. 603.—A very handsome stove Aroid from the South Sea Islands, whence it was introduced by M. AUGUSTE LINDEN to the Compagnie Continentale d'Horticulture. The erect leaf-stalks are glabrous, ivory-white, the cordate-acute leaf-blades green, with golden veins. We anticipate for this plant, of which at present we have only seen a small specimen, a distinguished position among ornamental foliage plants.

— **CRYPTOGAMIC SOCIETY OF SCOTLAND.**—The twelfth annual conference will be held in Aberdeen, under the presidency of Professor J. W. H. TRAIL, on September 29 and 30, and October 1 next. Should the season prove favourable there will be a show of cryptogamic plants. It is requested that those who have papers to read will communicate with the secretary, The Rev. Dr. STEVENSON, of Glamis, Forfarshire, is the Honorary Secretary.

— **THE LIVERPOOL EXHIBITION.**—M. JOLY has published a pamphlet in which he narrates his impressions of the Colonial Exhibition, of the "Shipperies" at Liverpool, and of the late Provincial Show in that city. Those who feel ruffled at the amusing criticisms of M. MAX O'RELL on England, will have their equanimity restored by the perusal of M. JOLY'S somewhat caustic criticisms of his own country, and will welcome what he has to say about ourselves as the verdict of a highly competent critic of great and varied knowledge of men and things in many countries, and one moreover gifted with a fluent graphic style. What M. JOLY says of Mr. BARRON will be cordially endorsed as correct. There is at the Royal Horticultural Society, says M. JOLY, an excellent man—one of few words, but of great energy, accessible to all, indispensable either as an organiser of flower shows, or as superintendent at Chiswick. Commenting on the boiler trials, M. JOLY describes the measures taken and the awards made, but adds, slyly, that all this was done without advancing the matter one step. He considers that his countrymen have nothing to learn from us in the matter of boilers or pumps. He stigmatises our summer-houses as heavy and tasteless, our glass-houses as good for cultural purposes, but monotonous

in appearance and inelegant. Here in England the substance goes for more than the form—the reverse of what happens in France. To sum up, he says that we are admirable cultivators, but deficient in the art of grouping, and generally crowd our plants unduly. He comments on the deficiency of Palms, Cycads, and Tree Ferns, which figure so prominently in the Belgian shows, and condemns our bouquets and floral decorations as too crowded. Hardy fruits and vegetables did not commend themselves to this critic, who, however, has a word of high commendation for our Grapes and forced fruits generally, all of which (as applying specially to the Liverpool show) we must admit to be on the whole a correct judgment.

— **GYMNOGRAMMA FARINIFERUM.**—This singular and elegant Fern, figured in the *Illustration Horticole*, t. 504, is said to be a seedling variety of *G. schizophyllum*. Two seedlings among a whole batch were observed to be covered with mealy pubescence, and were specially cared for. In time they produced spores from which the young plants have been raised, with the same characters. The elegantly cut foliage, dusted over with white meal, forms a striking contrast with the shining brown leaf-stalks. M. DE NOBLE has analysed the mealy powder, which he finds to be composed of a substance allied to wax. There appears to be no special glandular structure, so that the "ceroylin" must be exuded from the whole epidermal surface.

— **A GIGANTIC OAK.**—One of the sights of Paris at this moment consists in the trunk of a gigantic Oak placed in an iron boat especially constructed for the purpose, and moored in the Seine near the Pont de la Concorde. According to M. CH. THAYS, in the *Revue Horticole*, this trunk was found accidentally in the bed of the Rhone at La Balme as long ago as 1874, when, during a period when the water was low, a branch was observed sticking out above the surface. On closer examination this was found to proceed from a huge trunk embedded in the bed of the river. Not till ten years later—1883—was the level of the water again sufficiently lowered to enable the tree to be exhumed. Five months were occupied in the task of removing it from the bed of the river, some 10 meters of sand and gravel having had to be removed in order to liberate it. Ultimately on March 25, 1884, it was brought to shore, when the huge dimensions of the trunk were ascertained as follows:—Length, 31 metres = 101.7 feet; circumference at the origin of the roots, 9 metres; circumference at the level of the soil, 6 metres. The actual weight of the tree is 55,000 kilogrammes. The age of the tree is estimated at from 400 to 450 years. The boat, called the *Dryophore*, or Oak bearer, is intended to transport the tree from river to river, and we may perhaps see it moored alongside Cleopatra's Needle, whose adventures in a similar boat will be remembered by our readers.

— **AGAVE AMERICANA.**—A noble specimen in flower of the American Aloe (*Agave americana*) may be seen at the present time in the conservatory of the Royal Horticultural Society at South Kensington. The stem is about 15 feet in height, and is crowded at the top with yellowish-green flowers. The specimen in question came from the princely gardens of his Grace the Duke of DEVONSHIRE, at Chatsworth, and proved a conspicuous feature with other Chatsworthian contributions in the garden way at the last Indian reception at the Colonial Exhibition.

— **TUBEROUS BEGONIAS AT STANSTEAD PARK NURSERY.**—The number of Begonias at this establishment keeps on increasing, larger breadths than ever being planted with them. Both single-flowered and double varieties are getting better able to pose their flowers in an erect fashion. So far they fill the place of "bedders," for being below the eye they look upwards, and display their colours better than drooping kinds. Mr. LAING is keen in pursuit of a good white of this pattern, but as yet the desirable form has eluded him, and so likewise has the purity of the colour, for the whites hitherto are on the outside of the petals pinkish, a bluish that detracts from their usefulness as bedding plants. The yellows, scarlets, and crimson are of many shades, and are very well suited for outside uses or for the adornment of the greenhouse in summer time. If tuberosus Begonias were employed instead of Pelargoniums and

the like for some of the uses these plants are put to in the flower garden and conservatory, there would be a lessening of labour, as well as a gain in space in the houses during the winter months.

— **LAPAGERIA ROSEA.**—Mr. McLEAN, the gardener at Vinter's Park, Maidstone, sends us blooms and foliage of this plant, grown in the open air, which in perfect development equal those grown under the protection of a greenhouse. The aspect is west, and the wall to which they are attached is that of a Cucurbit-house. The plant withstood 21° of frost last winter—a fact to be attributed to the warmth afforded by the wall of the forcing-house.

— **INULA GLANDULOSA.**—Notwithstanding its introduction in 1804 this noble species is comparatively a stranger in British gardens. It is a native of Georgia and the Caucasian Alps, and is really a prince among its kind. A fairly good representation is given in the *Botanical Magazine*, t. 1907, but it fails to give an adequate idea of the living plant, at all events of a form that has been flowering for a considerable period in the herbaceous department at Kew. The species is to some extent variable, and a form has been introduced and described under the name of *I. grandiflora*. The distinction lies in the leaves being serrated in the latter form with gland-tipped serratures, while those of *I. glandulosa* are obsoletely serrate and glandular. These characters, however, vary even on the same plant in different seasons. The form at Kew has distinctly serrated leaves, and conspicuously glandular serratures. The solitary flower-head terminating a leafy flower-stem measures quite 6 inches in diameter, and amply compensates for the more numerous heads possessed by commoner but less effective species. The whole head is of a bright yellow colour, and the numerous narrowly linear rays resemble in no mean degree some of the finer Japanese *Chrysanthemum* of that colour. Were its flowering period a little earlier, when flowers are less abundant, it would doubtless receive a fuller meed of praise.

— **CYPRIPEDIUM ARIETINUM.**—This species, heretofore only known in Canada and the North-eastern United States, has lately been found on the mountains of Yun-nan, which may be looked on as continuations of the Himalaya in South-western China. As at present, the plant is not known to occur anywhere else, the fact is one of great interest. M. FRANCHET, to whom the publication of the fact is due, suggests as an inference, that this plant is one of the last existing evidences of the common origin of the Himalayan flora and those of the colder parts of North America. But if this be so, asks M. FRANCHET, is not the complete resemblance between the Canadian and the Chinese plant, separated by so vast a lapse of time and space, an argument in favour of the fixity of specific characters? It is worth notice that in this plant the three sepals are all distinct, as if it were an older type from which the present *Cypripediums* are modified descendants.

— **A LUNAR RAINBOW.**—It may interest some of our readers to learn that a magnificent lunar rainbow was seen in Staffordshire on Monday night last; it appeared at 8.55, and lasted until about 9.30. The bow hung in the west, and nearly the whole time the arc was perfect, and the prismatic colours very clearly defined.

— **RUBUS LEUCODERMIS.**—A striking wall plant is this white barked Bramble. Just now at Chiswick it is in flower and is very conspicuous, the bark giving the idea of its having undergone a process of whitewashing. To all lovers of wall plants, the walls at Chiswick have always some interest. The visitor is arrested by some subject that is captivating in its beauty—one that he looks upon in all its glory for the first time perhaps: to mention only the Cambridge colour of the fine *Ceanothus Gloire de Versailles*, still in grand form, to which brief allusion was made last week.

— **PREPARATION FOR GARDEN HOSE.**—Any principle which will tend to render canvas piping, garden netting, and such-like material more durable is essentially a matter of importance to the gardener. Messrs. MERRYWEATHER & SONS, a firm well known in London, some three years since took out a patent for rendering the above articles proof against rot, and they ask us to state that they are

willful to advise any one desiring information as to its application. It appears that the process is similar to that employed in the dressing of leather, viz., "Oak bark tanning." In a pamphlet issued by the firm are given some particulars, from which the following is an extract:—

"This liability of all canvas hose to deterioration by 'rot' is very well known by all who use it, but we question if the cause is generally understood. In fact, the nature of mould or mildew was for a long time very obscure, and even the ablest scientific men were divided in opinion upon the subject. Some supposed it to be a kind of chemical action or slow combination with oxygen continually going on in the material, while others attributed it to the action of extremely minute insects. Now, however, it is almost universally admitted to be a vegetable growth, originating in invisible spores or cells, constantly floating in the atmosphere, and which, when caught upon a soil congenial to their development, grow into a fungus called mildew. These spores or cells are so infinitesimal as to be invisible even with the aid of microscopes of the highest power; but Professor TYNDALL, in his recent investigations into floating matter in the air, has demonstrated by numerous experiments with a powerful beam of light, that they are always present in large numbers in the ordinary atmosphere.

"Before, however, these spores can actually develop into fungoid growths, they must come into contact with material in which the necessary conditions are present, just as the germ of disease must come into contact with its own nidus before the disease can establish itself in the body of the animal. These conditions notably exist in damp cotton, linen, leather, and other organic substances. If the conditions can be removed, the liability to damage by mildew will be avoided.

"The object we have had in view for some years is to remedy this great defect in canvas hose, by discovering some means of rendering the material sterile to the germs constantly deposited by the atmosphere; and we have at length attained it by means of a treatment which formed the subject of a patent application last month.

"By this process the hose is treated under pressure with solutions of Oak bark and other substances containing large quantities of tannic acid; and the effect is to make the hose absolutely proof against rot or mildew, or any damage from heating when put away wet; it also renders it more impervious to water, more supple, and practically unflammable."

— **GARDENING APPOINTMENTS.**—Mr. JOHN THORNS, late Head Gardener at Swift's Park, Cranbrook, Kent, has been appointed Head Gardener to ARTHUR WHITAKER, Esq., at West Grinstead Park, Horsham, Sussex.—Mr. J. BRYAN, late of Alderbrook, Cranley, has been appointed Gardener, &c., to EDWARD H. PALMER, Esq., Collingwood Lodge, Farnborough Station, Hants.—Mr. HENRY SWIFF, late Foreman at Burgley Gardens, Stamford, has been appointed as Head Gardener to CHR. NICHOLSON, Esq., of Balrath Barry, Kells, Co. Meath.—Mr. W. HAAMAN, late Foreman at Possingworth Gardens, has been appointed Head Gardener to the Earl of DENBIGH, Newnham Paddox, Luttrell, Warwickshire.

CYPRIPEDIUM MORGANÆ.

Puzzling as the results of the hybridist's work may be to botanists, at all events he has the excuse to offer that by cross-fertilisation he produces many beautiful flowers which could not be obtained by any other means. With Orchids especially we have ample proof that Nature is not slow to avail herself of cross-fertilisation as a means of improving or renovating a genus, but in a wild state, as a rule, only those which grow near together can cross, whereas in gardens the most beautiful products of widely distant regions are available, and hence the importance and usefulness of the hybridist's patient work. There is also another strong plea in favour of home-raised varieties, viz., that in most cases they are much easier to cultivate than imported species. If we want proof of this we have only to run over in our minds the numerous *Cypripediums* raised at the establishment of Messrs. Jas. Veitch & Son of Chelsea, and confirming facts are soon supplied. *C. Fairrieanum* is a well-known stubborn plant, and yet its offspring, *C. vexillarium* and *C. Athurlanum*, are very free growing; *C. Schlimii* is a plant which but few grow successfully, yet *C. Sedeni*, which was raised out of it as well as the whole line of grand *Sedeniform Cypripediums*, which resulted, are weeds to grow and flower perpetually. Again, who would ever have imagined that a union of *C. Roezlii* and *C.*

caudatum, which latter is not a good doer in many places, would result in the giant *C. grande*, which is noble in flower and in growth, the habit being more like a *Phormium* than a *Cyrtopodium*.

C. Morganæ, also, the subject of our illustration (fig. 49, p. 241), which was prepared from a plant which recently flowered with Mr. Ballantine, in Baron Schroder's collection, gives a fine example of the beauty and vigour of growth to be obtained by judicious unions. The plant was raised by Messrs. Jas. Veitch & Son a few years ago, by crossing *C. Veitchii* with *C. Stonei*, with what happy results a glance at our illustration will serve to show. The broad petals which much resemble those of the rare *C. Stonei* platyanthem, are white, slightly tinged with sulphur, and profusely blotched with purplish brown, the dorsal sepal white, tinged with rose and veined with red, lip white, tinged and veined with rose. The foliage is broad and handsome, green, very slightly tessellate, and altogether the plant is a grand production. It was named in honour of Mrs. C. Morgan, of New York, and requires to be grown in the warmest house with the Bornean species.

DISEASES OF CARNATIONS.

HELMINTHOSPORIUM ECHINULATUM, B.

DURING the last few years a destructive broom mould has been very common on Carnations. In bad cases whole collections have been destroyed. The name of the fungus which causes the mischief is *Helminthosporium echinulatum*, and its external appearance is shown natural size on the upper part of the accompanying illustration, fig. 50, p. 245.

The fungus was first described, with a small illustration, by the Rev. M. J. Berkeley in the *Gardeners' Chronicle* for March 19, 1879, since which time the attacks of the parasite have greatly increased both in frequency and intensity. The superficial appearance of the fungus as it grows on both sides of the leaf is very distinct, and may be immediately recognised by its correspondence with the accompanying figure.

The mycelium or spawn of the fungus, the threads of which are comaratively very thick, creeps in a radiating fashion inside the leaf immediately below the leaf epidermis. From the inside of the leaf the fruiting threads burst through to the outside in a series of black concentric circles like minute Fairy-rings. The appearance of one series of small black circles within another, each circle consisting of fruiting threads, is shown natural size on the leaf illustrated in the upper part of fig. 50.

When a fragment of one of the miniature Fairy-rings is removed with the point of a lancet, and examined under a microscope with a power of 400 diameters, the fungus is seen as in the lower part of the illustration. The mycelium is very thick and lumpy, and the supporting stems of the spores are also very irregular in shape, and jointed. The spores themselves, which are borne on the top, or at the sides of the fruiting threads, are very handsome, and are either without articulations, or have from one to five joints or septa, as illustrated. The spores are very finely and beautifully echinate; they are slightly constricted at the joints, and each spore is furnished with a very minute but perfectly distinct footstalk, as shown. When spores are jointed, as in the examples before us, each joint is capable of reproducing the fungus on germination.

As the fungus vegetates between the two membranes of the leaf it cannot be reached by any sulphuring process without destroying the leaves; the only mode of action, that can be taken therefore, against the fungus is to very carefully pick and destroy every infected leaf.

Dr. Cooke has described, under the name of *Helminthosporium variabile*, a fungus not to be distinguished from *H. echinulatum*. *H. echinulatum* sometimes leaves Carnations, Sweet Williams, &c., amongst the Caryophyllaceæ, and infests *Ornithogalum*: when on *Ornithogalum* the fungus is named (for a change) *Heterosporium ornithogali*. Three years after Mr. Berkeley had published the plant before us under the name of *Helminthosporium echinulatum*, he republished it in the *Annals and Magazine of Natural History*, May, 1873, under the name of *H. exasperatum*! The fungus, therefore, has four names—two given by the same author, and two which must be regarded as synonyms.

The worst part of the study of mycology is the

names. Two dozen long and unouth names for one fungus is nothing uncommon. The families of fungi sometimes have diverting names, as the Cienkowskiæ of Rostafinski. Non-professionals are apt to smile when no one is looking. When synonyms are not given an earnest beginner is likely to find himself in a dense mental fog, if not in a madhouse. Nature has been badly treated by some botanists, especially by young mycologists with a penchant for inventing new, long, meaningless or misleading names. *Worthington G. Smith, Dunstable.*

HOME CORRESPONDENCE.

FIGS.—I venture to ask a question. The Vicar of St. Peter's, of this place, who is a great amateur, has two Fig plants in his garden, which he thinks came from seed dropped by birds. There is a large Fig tree in this garden, but it is about 20 yards from where these young plants are. I told him I had read in the *Gardeners' Chronicle* some months back that the Fig did not ripen seeds in this country, and that in order to do so the presence of the Caprifig, which I understood to be the male plant, was necessary. The leaves on the supposed seedling plants are exactly similar to those of the Fig existing in the same garden. I can hardly think the plants can be seedlings. It is possible they may have been suckers which have been pulled up and thrown accidentally where they now are. A. D. [Never, within our knowledge, have seedlings been raised from English Figs. We have never found male flowers in English Figs, and we do not know of any duly authenticated record of any person having found any such. We have received seedling Figs "supposed" to have been raised from seed borne in English fruit; but our appeal for careful observation and experiment to remove this question from the region of doubt has apparently met with no response.

It has, however, been asserted or stated generally that Fig trees have been raised from English ground seed, and we are not prepared to deny this, although no properly authenticated instance has been brought before us. As was suggested in the abstract of Count Solm's essay in these columns (n.s., xix., p. 530) the production of seedling Figs in the absence of the pollen of the Caprifig may be due to parthenogenesis, or what has been so named by some botanists, while others describe it as something analogous to the formation of bulblets in the ovary. Another possible explanation of the circumstance is that individual Fig trees, like some other dicecious plants, may sometimes bear crops of male flowers. Evidence bearing on this subject was summarised in n.s., xx., p. 22, and we have really nothing more at present to add. We can only recommend it as an interesting subject of inquiry for those who have the means of investigating the matter. Ed.]

Single Dahlias at the Botanical Gardens, Chelsea.—It is said that the single Dahlia is rapidly declining in the popular estimation. Having been elevated into the front rank of floral pets, it has ceased to be so fascinating as it formerly was; and it is now suffering the usual fate of favourites, and experiencing that fickleness is a characteristic of Flora's as of other courts. But the fall of the favourite is not so much its own fault as that of the raisers of new varieties; they, in their haste to produce them for an indulgent public, selected very tall and coarse-growing types, spare of bloom, and producing large saucer-shaped flowers that had in great measure lost the charms of elegance and simplicity which marked the earliest flowers that gained the notice of the public. If the single Dahlia is to remain a floral favourite, there must be something like a new departure in the selection of varieties, and the sooner the path is entered upon the better. Ever since the single Dahlia appeared as a candidate for public favour, Mr. Thomas Moore, of the Chelsea Botanic Gardens, recognising the capacities of the flower to suit the public taste, set himself to work to raise new varieties after a type set up for his ideal, and he succeeded to a large extent. He accepted the type of *D. gracilis*, with its dwarf free growth and elegantly cut leaves, as furnishing an approximate model of habit, and combining with this varieties intermediate between *D. gracilis* and the older type of growth, he has produced, and has now in bloom in the Chelsea Gardens, a batch of varieties that seem to me to sum up the chief requirements in the way of single Dahlias. They are of dwarf growth, generally averaging 2 to 2½ feet, of free branching and yet compact growth, and singularly floriferous, with medium sized flowers of good shape, and distinct colours. A few of the leading varieties are as follows—Edina, white, flushed with bright lilac; Figaro, a bright yellow variety of the *gracilis* type; Uriel, rosy-violet, very fine in all respects; Buffalo, buff, tinted with red;

Inoenge, blood-crimson, very free, and good habit; Angelo, purple-crimson, with white centre, novel and distinct, a little tall, about 3½ feet; Fido, deep magenta-crimson; *gracilis rubra nana*, about 18 inches in height; good colour, very free and excellent; Pyro, bright crimson-scarlet; Juvo, pale lilac-pink; Venus, light orange-scarlet; Oberon, shaded rosy-magenta; Sancho, vivid crimson, extra fine for its rare shape and rich colour; Thomas Moore's deep maroon, shaded with crimson at the base of the petals, very good; and Phyllis, brilliant pale crimson. R. D.

White-flowered Forms of British Plants.—During the present season I have noted large patches of the white-flowered *Ajuga* in a woodland here; *Pedicularis palustris*, with pure white flowers, in a mountain swamp; and the Harebell, Wood Betony, *Ornithogalum latifolium*, and *O. maculata* of the same colour. In a high-lying woodland, and over a space of perhaps 20 acres, a variegated-leaved form of the Wood Sorrel almost carpeted the ground, nearly every leaf having at least one of the lobes pure white, and occasionally one of the others mottled or spotted. Such a quantity had an appearance as pleasing as it was uncommon. A. D. W.

Pea Telephone.—This variety has behaved here this season in a similar way to Mr. Rust's sorts (p. 215). Prodigy and an unnamed variety of the same type are also identically affected; but in our case the injury is caused by an attack of mildew just before the majority of the flowers opened. We have had only a very few good pods on these varieties, while others of the smaller podded class, such as Standard, Marvel, Goldfinder, President Garfield, &c., have done remarkably well; in fact, my employers tell me they never had such good Peas in any previous season. I consider, therefore, that Telephone and others with large inflated pods are more susceptible of injury by mildew than the compact podded varieties. W. H. D.

Peach Alexander.—Mr. Ward at p. 210, is reported to say he intends removing this Peach into an early Peach-house. I would say don't! Both Alexander and Waterloo don't appear to relish either tropical climes or glass skies. At the great Peach place, Ketton Hall, they have had fair trials, under the best of management, and both have failed to bear satisfactorily. Two large trees were taken out of glass houses—one of each kind—planted on a south aspect, and have borne crops very good for the season, I quite agree with Mr. Ward as to the flavour of Alexander being perhaps the best of the early section, although I like Amsten Peach, taking it all round. R. Gilbert.

The Sweet William.—Sometimes written of as a florist's flower, but more often referred to simply as a border flower, the Sweet William may well claim to higher attraction than it now obtains. It ought to be difficult to find a bad strain of these anywhere; it is probable, however, that inferior strains are yet too plentiful, hence myriads of those who cherish varieties, for old-fashioned flowers, have so far had little experience of the great beauty now found in Sweet Williams. In the old types the blooms were small, lacking form, quality, and distinctiveness of hues and marking; now the flowers of the best strains almost rival in size and richness of colouring the beautiful annual Dianthus, and probably excel these even in variety of markings; then not only are the individual flowers so fine, but the trusses are large also, and if florists have tastes for form, smooth edges, and defined markings, they may find them to their heart's content. It does not seem as if florists had created for the Sweet William any special points, although what are not inaptly termed ringed flowers seem to find much favour in some quarters, these too, being usually smooth-edged. Generally, at exhibitions, where sometimes good Sweet William may still be found the largest and most attractive blooms gain the honours. Without doubt, ringed flowers are very charming, but in lacking variety seem to lose one of the chief charms found in this fine old border flower. The most attractive forms now are found in the flaked and matted flowers, and these are indeed, both varied and beautiful, and indeed indescribable. Very striking also are the dark self hues, especially crimsons, scarlets, and purples, and these not the poor small things with which many are conversant, but huge flowers fully 1 inch across and of fine form. There are sometimes found very good whites or shaded hues, but these are less common, and amidst so much rich colour are hard to preserve. A really pure white Sweet William is a good thing if the blooms be as correspondingly large as are those of the dark hues ones. Not so long since there were special strains, in which those displaying a slightly the smooth-edged ringed flower were Annulicæ, having white eyes with rich coloured grounds and serrated edges; and Barlow's, a good general strain. Now we may find all the best of these forms

through care and attention rolled into one, and any good strain of to-day should possess all kinds and forms in hue and marking finely developed. General evenness in habit is also desirable, but less easy to obtain. Some plants will break more freely and produce many stems or trusses of bloom, and of course do not get so tall. Others produce fewer stems and taller ones. Very much may, however, depend upon the time of sowing, and those who would have good plants for next year should have their seedlings almost ready to plant out now. Really seed should be sown out-of-doors in April if strong plants that will carry from six to twelve heads of bloom are to be secured the following year. It is better to sow in rows well following. When planted up in beds and in rows a foot apart the effect is good indeed, if all the plants stand well, as they should, for they are very hardy. A really good even mass of mixed Sweet Williams is something to be proud of. *A. D.*

Crinum Powell.—My clump of this handsome hardy border plant, with eight spikes of its large bright rose-coloured flowers on flower-stalks 4 feet high, is now very beautiful, if only I could find some means of preventing the most-crawling slug or snail from eating the petals of the young flowers just as they are about to open. *W. E. Gambelton.*

Xanthoceras sorbifolia.—Referring to this plant I may mention that the fruits attain a larger size than those figured at p. 205. The late Dr. Hance told me when I was at Whampoa in 1874 that the fruit was sold as an edible fruit in the markets of Northern China. The racemes of flowers are erect, but the fruit hangs from its weight. The flowers are white with a yellowish eye, which turns to a lovely pink. The figure you gave in the *Gardeners' Chronicle*, August 14, is perfectly correct, as also that in Van Houtte's *Flore des Serres*. The shrub is hardy in Belgium, but its weak point is at the collar. My plant has been twice killed to the ground through decay there. It may be easily propagated by root cuttings. *J. Van V., Brussels.*

The Boiler Competition at Liverpool.—In your publication of the 7th inst. a letter appears signed "J. B. Jun." (and which has only just come under my notice) on the above-named contest. I thank him for his compliment to my boiler, and as his letter purposes to be a reply to a communication of mine, previously inserted in your journal, I ask the favour of commenting on "J. B. Jun.'s" remarks, who seems to be of opinion that rules may be evaded, as Rules Nos. 5 and 6 were, and not adhered to by my competitors. I admit the contest was between the boilers, but on equal footing as to rules. It was to discover which boiler could obtain the greatest heat in cases of emergency. I take it a little extra fuel should be of no consequence to produce immediate or prompt heat during severe frost, and the fire kept up to maintain the same. Is it feasible to make readers interested in the question believe that a boiler with 43 inch rise (as mine only had) is not at a disadvantage in the contest with one of 11 inch rise and the same length of pipe? Mine also was the smallest boiler, and yet attained the greatest heat. Had I had the same rise as my competitors I could have obtained a far greater heat. Every competitor was supplied with rules a considerable time previous to the contest, and each should have complied with them, as I did, or have been disqualified. In reference to water-bars, which "J. B." alludes to, I maintain they should in all cases be connected with the boilers, and have only one flow, the same as I had, as specified in the rules. Another point he alludes to is the levels which he credits me with being highest in temperature. I consider this no compliment, as I won the points fairly, although I burnt about a bushel of coke extra, and had the best fire after two hours' banking, and it would have lasted seventeen hours' altogether, and had no recourse to improper means. I have no doubt it would be interesting to the interested if all that transpired at the contest was reported as it came under the judges' notice. I would suggest at any other boiler contest, that if valves are inserted they ought to be locked or sealed, and no competitor should have control of them, and that all fuel not supplied by the judges' during the contest should be removed or not combustible. As the rules laid down were allowed to be infringed on, notwithstanding that I strictly adhered to them, I leave those interested to judge if I have had justice done me, and to find a reason why the rules were allowed to be broken. *T. Wood, Rudgatey House, Eastville, Bristol.*

Lilium formosanum.—I have sent a spike of the beautiful *Lilium formosanum*, which succeeds well here in the open border, being perfectly hardy—in fact, much more so than the common longiflorum, from which it differs in several respects, the stems being purplish-brown, extending along the three outer segments of the perianth, which are not so

widely revolute as in any other variety of longiflorum. Its fragrance, too, is different, reminding one more of *Lilium odorum*, which it resembles more than any other Lily; and I think that when better known it will become a great favourite. It was introduced by Mr. Maries from the island of Formosa, and flowered in the nursery of Messrs. Veitch in the autumn of 1880, and received a First-class Certificate from the Royal Horticultural Society. *Taylor Shiers.* [The flowers sent resembled *L. longiflorum* var. *Takesima*. Ed.]

Carnation Lady Agnes.—I enclose a few blooms as cut off my seedling, Lady Agnes, which is a favourite here; being of a salmon-pink it is very telling, and is a profuse bloomer, averaging over 250 blooms and buds on each plant. It is one of the earliest to open, and continues until the frost cuts the buds, and withstands the sun and rain without the colour running. It has proved itself a hardy sort. I have two borders, each 34 yards long, of mixed varieties, including the old Clove, which have succumbed to the severeness of the past winter, but this variety survived the cold and wet. *A. Evans.* [Apparently a useful sort for cutting, but apt to burst its calyx. Ed.]

FIG. 59.—FUNGUS DESTRUCTIVE TO CARNATIONS: HELMINTHOSPORIUM OCHLADRATUM.

Double Flowers (p. 208).—We have this season a plant of the wild Poppy, *Papaver rhoeas*, which came up by chance in the herbaceous border, and has produced flowers, beautifully double. This seems likely to be a valuable plant for cutting from and also for the garden decoration, if prejudice is not too much against it in a garden. Has a double variety of this plant ever been noticed before by any one? [plenty]. *W. H. Divers, Ketton Hall.*

"Our Native Flora."—The subject of the preservation of our native flora was ably dealt with by Mr. Shirley Hibberd, who recently read an interesting paper before the Horticultural Club, in London. Evidence was given to show that many of our British Ferns had already become extinct in certain districts, and some flowers were now scarcely to be met with. This is greatly to be deplored, and as a member of the Club, now that the season for botanical rambles and village flower shows is at hand (or rather, the authorities are making their arrangements), will you allow me to bring the matter forward and urge that the directors of these rambles to discourage the ruthless rooting up of specimens, and to take care that species are not entirely destroyed by every specimen being taken.

These spoils of the woods and fields, thus dragged from their native soil in ninety out of one hundred cases fail to grow, and many of the nosegays gathered get no further care on their owners reaching home, and may generally be found in the dust-bin next morning. For all practical purposes, foliage and flower are enough for study and comparison. The case of Fern hunters was specially mentioned; some millions must annually be destroyed by the itinerant hawkers of the beautiful plants, and their ravages soon take effect as they are but slowly reproduced, and when made up for sale with moss and cones, are destined soon to become unsatisfactory. If any of your botanical readers chance to find a rare species, let him or her have the glory of showing the same as a cut specimen to his friends, but the habitat should remain a dead secret, or extinction must inevitably follow. The system of giving prizes for wild flowers at exhibitions is to be commended, as the love of flowers cannot be too much extended—but, alas! frequently the "poies" put up by school children are mere bunches of blossom destitute of tasteful arrangement, and by no means things of beauty. To foster enquiry and research, prizes should be offered for a stated number of varieties, say twenty-four or thirty-six, and a similar class for grasses, limited to three pieces of each; probably some amateur would gladly name them, and thus lead the way to study. The committee should provide small bottles or vases for the purpose, as set stands are costly; and in lieu of money prizes (which to many juveniles mean sweets at *tab.*) suitable elementary book on wild flowers might be given. While on this subject may I also put in a plea for the moths and butterflies? As an old collector it was my custom to kill any rubbed or damaged specimens, as they could be left for the preservation of their species, and never to take more than a few of any kind, more especially the rarer ones. It is well known that the avidity of trade collectors has caused certain insects to become all but extinct, and my object in writing these few lines is to aid in the preservation of these interesting and lovely objects for the benefit of posterity. The growth of towns, and the great increase of cultivated land, meaning less woods and fewer open spaces (where the flowers and insects suffer extinction), have left Nature a smaller field for her operations. Let us then do our best to preserve those treasures bequeathed to us, and instruct our children to do the same. *A Lover of Nature, in "Kent County Standard."*

Cycas revoluta.—One would hardly call the Cycas a hardy plant, yet a case which came under my notice, at Betchesanger Park, Kent, the seat of Lord Northbourne, of one having safely withstood the rigour of the past winter is worthy of mention. The plant in question is a fine specimen. Originally growing in the stove it flowered in 1880, the inflorescence resembling a tuft of woolly pinnate leaves curving inwards, borne in the centre of the crown. The following year it threw up forty new leaves and flowered again in 1882, and was photographed. Ultimately, becoming too large for the stove, it was transferred to a large conservatory, remaining there until the summer of 1885, when it was taken outside, and left to take its chance during the past winter. Last June, the old leaves being somewhat browned, they were cut off and the plant taken back into heat to ascertain if life still existed. At the present time, judging from the vigorous growth shooting up, the plant is apparently little the worse for the somewhat unnatural treatment to which it has been subjected. *A. Herrington, R.H.S., Chiswick.*

Mice v. Elder.—Not unfrequently one reads of sad destruction amongst young trees, and, indeed, old trees too, by some vermin or other troubling the bark from around the stem and branches. This has usually been attributed to rats, squirrels, and mice, rarely the latter, when the gnawing is done at a height greater than that to which hares and rabbits can reach. I have always been somewhat sceptical of such condemnations, but as "seeing is believing" I am once and for all convinced of the accuracy of the statements, for twice during the past fortnight have I seen the common field mouse feeding on the leaves and young succulent twigs of the Elder at a height of fully a dozen feet from the ground. *A. D. W.*

Sweet Brier Hedge (*Gardeners' Chronicle*, June 26).—Since my last note on the culture of the Sweet Brier, I have received from a gentleman a wholly different account of the best way to grow it. Mr. Frederick Clowes of Windermer, my correspondent, having kindly given me leave to publish his suggestions, I have now much pleasure in submitting them to your readers. Mr. Clowes writes that I have over-estimated Sweet Brier a short time myself, but I learned how to do it from Mr. Swinburne, who lived here, the father of the present Sir John Swinburne, of Capheaton. Mr. Swinburne was long successful with his hedges of Box as well as of Sweet Brier, which were well known at the time. His plan—add the right plan—is to follow the natural habit

of the plant where it flourishes. Instead of pruning—which should never be done—bead down nearly to the ground all the long one-year's shoots from time to time, securing them by hooked sticks or tying them to other shoots as may be most convenient. These will send up other shoots, and so you get a thick hedge. If this is done from the beginning, it is all that is required. Of course there is in time a lot of dead and some little living wood which, with a little common sense, may easily be removed. Mr. Swinburne, who has been dead many years, practised this plan for some twenty years in two different residences. The hedge should be well exposed to the sun; but the frequent bringing down of the long shoots is the only matter of importance." I thought that a photograph of Mr. Clowes's hedge would supply material for an interesting illustration for these pages; but my correspondent informs me that his hedge is not in a good situation either for growth or photography. It would (he writes) scarcely show any character, because it has been long enough established, and, moreover, has been neglected. *W. H. Sewell, Yaxley Vicarage, Suffolk.*

Sulphide of Potassium.—This remedy for mildew (first recommended in the *Gardener's Chronicle*) has now been extensively used by a large number of our leading gardeners, and as I have been mainly instrumental in getting its merits tested by some of our best men, I am glad to be able to report that the anticipations of the discoverer of its value as a remedy for mildew have been fully realised. As it is a remedy at once cheap and effectual, I am anxious to make its merits better known, and to point among my fellow amateurs and gardeners generally. I shall be glad to receive a line from all who have tried the sulphide detailing their experience, with a view to publishing the results for the benefit of the gardening community. As mildew is very prevalent this season I hope every one who is troubled with this pest will test the sulphide, and report whether it proves successful or not. *Edward W. Badger, Mosley, near Birmingham.*

A Remarkable Lime Tree.—This is to be seen in the grounds of the Hon. W. Matlock Bath; and it is reported to be at least 100 years old, and local records say, probably with much truth, that it is one of the largest in the kingdom. When, and under what circumstances it was originally planted is not known. The tree measures 300 feet in circumference; the branches sweep down to the ground, and are propped up by strong supports in all directions, and the points of the branches resting on the ground impart to it a very unique appearance. Mr. Thomas Tyack, the proprietor of the New Bath Hotel is very proud of this arboreal wonder; and he informed us that he has frequently dined between 200 and 300 persons under its branches. Visitors to Matlock Bath should not fail to inspect this really wonderful tree, which is carefully preserved by Mr. Tyack, and shares with the petrifying wells, the grand scenery of the Derwent Valley, the veteran carp in the town pond, the trout fishing in the Derwent, the warm springs, &c., the honour of being one of the sights of this charming Derbyshire place. *R. D.*

Bandina Boxwood.—Mr. John R. Jackson, of Kew, has recently forwarded a small slice of this wood cut from a block now being exhibited at the Fijian court of the Colonial Exhibition, with a request that I would try and report on its character as a wood for wood engraving purposes. The wood cuts equally well with good Box, but its colour, a very dark brown, will always prevent its use. It is impossible to get a white surface for drawing, and owing to its dark colour an engraver cannot tell the kind of line he is cutting. Its extraordinary weight is also a great defect. Its closeness of grain, density, and toughness, it is perfect. English Yew is, however, quite as good, or even better; Hawthorn next. Mr. Jackson does not know the tree which produces "Bandina Boxwood." *W. G. S.*

The Double White Lily.—I enclose you some spikes of *Lilium candidum*, and would very much like to ascertain the cause of their becoming deformed in the flowers; as least 90 per cent. of them have come the same as the enclosed. Some of the bulbs have been planted two years, some longer, perhaps for four or five years, on the same ground (not transplanted). I may mention they have come more or less like the enclosed flowers since three or four years. *James Shaw, Gr., The Gardens, Bellintra.* [The specimens sent were those of the so-called double variety cultivated in old-fashioned gardens from time immemorial. No perfect flowers are produced, but in their place the flower-stalk bears towards its upper end a series of white, bell-shaped flowers scattered spirally at short distances apart. As to the cause of the change we are in the dark; we presume that some check

occurred in a very early stage, preventing development of the flower in the ordinary manner, and causing it to produce these white leaves instead. If, as we infer from our correspondent's letter, the bulbs are originally produced flowers in the ordinary way, and they or their direct successors now become double, the case is very interesting. Ed.]

The Cyclamen persicum.—Few occupants of the greenhouse are so popular as these, and it follows, as a matter of course, that if plants become popular they are also carefully cultivated by the public, and interest it is to supply the public with what they require. New and vastly improved forms are also periodically added to those we already possess, and the interest is thereby stimulated and sustained. Those who have to keep up a large supply of Cyclamens for winter flowering cannot very well do so by purchasing plants, at least, not at a reasonable price. The best Cyclamen seeds are rather expensive, but it would be poor policy to save a few shillings by purchasing seeds of inferior quality, when the results of twelve months' labour would be a poor strain of flowers, taking the same house-room and as much valuable labour expended on their culture as the best. One of the first questions asked by the cultivator is, What is the best time to sow the seeds? The best time is when the seeds can be sown to produce flowering plants that will be of the least trouble and expense to grow to flowering size. Now of all cultivators of plants, on strictly business principles, the growers for Covent Garden Market are the most likely to be right in this important matter of economy. They must do two things. The first, and most important, is to grow the plants well; the next is to grow them cheaply. One of the best cultivators for market, told me he sowed his seeds about the first week in July in pots or pans, and placed them in a cold frame at that date, a cold frame would, with a little management, be kept at a temperature of 60° to 65° at night, with 10° higher by day. The seeds would vegetate towards the end of July, and could be potted off singly into thumb-pots in August. They make good progress in the cold frame until the middle or end of September, when they are placed in a moderately warm house on a shelf near the glass; from 50° to 55° would be a good night temperature at that time, but in winter 45° to 50° is quite high enough. The plants are potted on as they require it, but taking care not to over-pot them as they will do well in 5 and 6 inch pots. About the end of May the plants are again removed into cold frames, and by-and-by, as the summer advances, they are treated to the lights being removed at night, but placed over them by day with plenty of ventilation. A light shading is thrown over the glass to protect them from direct sun-shine; exposure to the full sun at midsummer, would check their growth, which must be continuous up to the time the plants are in full bloom. Once they are required in the winter season, and fine healthy specimens with from fifty to sixty flowers all open at once, are very valuable in the market, especially a good strain of white varieties. When looking over Messrs. Sutton's collection of plants in their experimental nursery at Reading recently, I saw a house full of large well grown specimens ripening their seeds, and as the plants were so fine I naturally inquired how they had been grown. The seeds, I was told, were sown in November, and by the next November the plants had produced each of them 150 to 200 flowers. They had been grown in a hothouse temperature except during the summer months—not a very high temperature, as that would draw up the leaves and flower-stems weakly. The object of growing these plants was merely to save seeds from them, and experience had taught the Messrs. Sutton that the above was the best way to obtain the desired end. One of the best collections of Cyclamens I ever succeeded in raising were from seeds sown in January in a heated propagating house. The seeds vegetated in from two to three weeks in a gentle bottom-heat, and as the plants became large enough they were potted on into thumb-pots, and subsequently into 4 and 5 inch pots; but they never were outside the house which was kept at a moderate stove temperature, and always very close to the glass. They produced from twenty to thirty flowers on each plant in November following, and were a beautiful feature in the greenhouse all the winter. The soil in which they were potted was composed of three parts turfy loam, one of peat, one of leaf-mould, some small pieces of charcoal, and a little sharp sand. Cyclamen flowers are very useful in the winter months for decorative purposes, but the stems must not be cut or broken, as the parts of the stem that remain would rot, and injure or quite destroy the plants. The stems with the flowers attached can readily be pulled out by the hand quite from the base, and this is the right way to gather them; doubtless most people are aware of this, but some are ignorant of it. I may add that old specimen plants, if it is intended to grow them again, should be placed in a cold frame facing north, and they should receive but a moderate supply of water at

the roots. If the nights are cold leave the glass lights over the plants, but on warm nights they are better to be left off altogether. Young plants intended to be grown on quickly to a large size will do better over a hot-bed than an ordinary one. The heat ought not to be violent, as that would be injurious; a very mild sweet bottom-heat would produce large healthy foliage. Air ought to be rather freely admitted. *J. Douglas.* [It may be mentioned as showing the want of unanimity amongst trade growers as to the best time to sow, that a well-known firm sows its Cyclamen seed in January and February, not crediting the fiction that the seed will not keep till then. Ed.]

Reports of Societies.

THE SCOTTISH ARBORICULTURAL.

THE thirty-third annual general meeting of this Society was held on Tuesday, August 3, in the committee-room of the International Exhibition, Edinburgh, Dr. Cleghorn, President, in the chair. In the minutes of the Council it was recorded that Dr. Cleghorn had intimated his intention of resigning the office of President, and that the Council had expressed their thanks to him for his services to the Society. Sir Herbert Eustace Maxwell, M.P., had been requested to allow himself to be nominated as President, and had agreed to do so. Letters of apology were intimated from Sir Herbert Maxwell (who, as Colonel of the Galloway Militia, is at present with his regiment in camp), and from Mr. Robert Hutchison, of Carlouvie.

NEW MEMBERS AND OFFICE-BEARERS.

SEVENTEEN new members were proposed and were duly admitted. Sir Herbert Eustace Maxwell, Bart., M.P., Monreith, was unanimously elected President; the Chairman observing, in proposing his name, that Sir Herbert, being on the Parliamentary Committee dealing with arboricultural matters, would be of valuable assistance to them in the new Parliament.

THE RETIRING PRESIDENT'S ADDRESS.

Dr. Cleghorn said the first thing that occurred to him was that they should record their thanks to the Executive Council of the Exhibition for their kindness in granting them the use of their room. The last period of presidency to which their address had elevated him having expired, the Society had elected to the vacant chair Sir Herbert Eustace Maxwell, Bart., M.P., a most energetic landed proprietor, well known for his love of arboriculture, and his attainments in archeology. He had been an active member of the Parliamentary Committee on forestry two sessions, and would no doubt render valuable service when Parliament met again. They had hoped that he would do so, but he had favoured them with the annual address, but as they had been informed by the Secretary, their new President was unavoidably absent. The Society continued to maintain its important position, and now numbered about 800—viz., honorary members, 18; life members, 120; ordinary members, about 600. Additions to the library had been received from various quarters, and the collection of forest literature was now varied and extensive, including many valuable works, British and Continental. The difficulty of locating their collections remained. They were temporarily stored at St. Andrew Square until matters regarding the Forestry School were arranged. The new part of their *Transactions* had just been published, and he ventured to say that the contents were of special interest to all of them. During the past year several members had been removed from their death. In the newspapers of last Saturday was recorded the demise of a very distinguished Scottish forester, and an eminent arboriculturist, Mr. James Eburn, LL.D., late of Craigmuir, Stirling, who died at Ontario, Canada. He was well known and highly esteemed by many of their older members, and his work, *The Forester*, has passed through several editions. It still was a standard work of reference. One of his sons, Mr. J. E. Brown, was doing excellent work as Conservator of Forests, Adelaide, and was bringing about a better forest flora of the province which was under his care. Other deceased members were Mr. John Ferguson, late Deputy Conservator of Forests, Malpas; Lord Waverley, and Mr. Colquhoun of Luss. The premature dissolution of Parliament having brought the deliberations of the Select Committee appointed to consider whether, by the establishment of a forest school, or otherwise, their woodlands could be rendered more remunerative, to a sudden close—the report issued on July to contain the evidence of five witnesses (Colonel Pearson, Dr. Crombie Brown, Dr. Schlich, Inspector-General of Forests, Mr. Julian Rogers, Secretary, Institution of Civil Engineers, and Mr. Alexander Mackenzie).

The subject was pretty well threshed out, and the witnesses were all agreed on the main question, although they differed as to minor details. There was but one opinion, that foresters should be instructed as to the theory of their craft. How this might be best accomplished, and where the conveniences in Great Britain for establishing a Forest School capable of imparting the special knowledge acquired in Continental schools existed, was still open to discussion. Dr. Brown and himself (the Chairman) spoke strongly in favour of Edinburgh. Other witnesses advocated the Agricultural College, Cirencester, Gloucester, Downton, and Cooper's Hill Engineering College in Middlesex. When the forest school, or schools, might be established was uncertain; but that the forest school must come there was no doubt. In a time of extraordinary commercial depression there have been unusual obstacles. In conclusion, the Chairman adverted to the splendid collection of forest produce that was to be seen at the Indian and Colonial Exhibition, and remarked that no one could visit the Exhibition without being impressed with the magnitude and resources of the Colonies. The Indian forest trophy was a splendid piece of work, and included no fewer than 3000 specimens of Indian timbers. He specially alluded to the value of the conferences which had been held in connection with the Exhibition, at which as he indicated, much valuable information had been exchanged between experts, which would, he was convinced, be of the greatest importance. He trusted that as many arboriculturists as conveniently could do so would visit it.

Mr. W. M'Corquodale, in moving a vote thanks to Dr. Cleghorn for his address, took occasion to refer to his retirement. He specially alluded to Dr. Cleghorn, he said, had given much valuable time and labour to the interests of the Society. They all regretted his retirement, but they hoped he might be long spared to go in and out among them.

The Chairman said his connection with the Arboricultural Society had been a great pleasure to him. He was spending the later years of his life in retirement at St. Andrews, but he could come over as often as he could to be present at the meetings of the Society.

ACCOUNTS.

The Treasurer reported that the income and expenditure for the year had about squared each other, viz., £245 18s. 10d. The capital of the Society amounts to £328 13s. 5d.

Mr. Dana, Dalkeith, in moving the approval of the accounts, said he trusted that by another year the Society would be in a flourishing financial state. It was doing a good work in the country, and it deserved to be supported even more than it had been on account of its eclectic character, its membership including landed proprietors, gentlemen interested in arboriculture, foresters, and assistants. He thought that on the whole they had great reason to congratulate themselves.

Mr. D. F. Mackenzie, Morton Hall, seconded the motion, which was unanimously agreed to.

COMPETITIVE ESSAYS.

On a report by the Judges, the following honours were awarded for competitive essays:—

1. The Rearing and Management of Hardwood Plantations—Bronze Medal, A. Macdonald Grant, assistant forester, Hopetoun.

2. Specifications and General Conditions of Contract for Works to be Executed in the Erection of a Forester's Cottage—small Silver Medal, W. McIntosh, 5, Thistle Street. Commended: Alexander Pitcaithley, forester, Kinross.

3. Plantations and Trees on the Estate of —, in the County of Ross—small Silver Medal, Alexander Pitcaithley.

4. The Native Trees and Shrubs of Carnarvonshire—small Silver Medal, A. D. Webster, Penryn Castle, North Wales.

5. Hedgerows and Field Timber—Bronze Medal, A. D. Webster.

6. Hedges: Useful and Ornamental—Bronze Medal, A. D. Webster.

7. Old and Remarkable Trees on the Estate of Penryn and Kewales—small Silver Medal, A. D. Webster.

8. The Present State and Future Prospects in Arboriculture in Hampshire—Gold Medal, John Smith, surveyor, Romsey.

9. The Forest—Forestry—Gold Medal, to the writer "Deus Nobis," &c., Gold Medal on condition the essay was finished.

10. Best size of Plants, and Method of Planting to produce the best Results in different Soils and Situations—small Silver Medal, J. B. Ramsey, Iron.

11. Best size of Plants and Method of Planting to produce the best Results in different Soils and Situations—small Silver Medal, David A. Glen, assistant forester, Gartshore.

12. Collection of Conifer Seeds—Silver Medal, James Birby, Stevenston, Devonshire.

In submitting the report, Mr. Dana said the judges were of opinion that the essays were all very creditable to the authors, and valuable to the Society. He

trusted that the foresters, and especially the young foresters, having now got settled down after the excitement of the Forestry Exhibition, an increasing number of them would be found in the ranks of the competitors. As many of them as possible ought certainly to take the hint of the Chairman and visit the Colonial Exhibition. But they need not despair by what they saw there, for he believed, that so far as circumstances would admit, Scotsmen could grow as good trees, and put them to as good use, as any other people in the world.

AN ARBORICULTURAL JOURNAL.

In connection with the demise of *Forestry*—the magazine which was the recognised arboricultural organ, a discussion, initiated by Mr. Baxter, Dalkeith, took place as to whether or not something should be done to remedy the matter. The meeting seemed to consider that it was a very desirable thing that arboriculturists should have a special journal, and a remit was made to a committee to consider the whole matter and report to a meeting of Council.

SILVER FIR FOR RAILWAY SLEEPERS.

Mr. M'Corquodale said it might be interesting to the members to know that quite recently an examination had been made of several Silver Fir sleepers which had been put into the railway line at Lanercy, near Perth, nine years ago. He was glad to say that at this date they were still quite sound, and looked as if they would last another three years at least. No creosote or other preserving substance had been used. He believed Silver Fir would yet be acknowledged the best wood for railway sleepers.

The Chairman added that the usual life of a Larch sleeper was eight years, and of a Scots Fir three or four.

MISCELLANEOUS.

Mr. John Methven, Edinburgh, asked an expression of opinion from the members as to a proposal which had been mooted to establish a benefit society for decayed foresters. He knew there were great difficulties in the way; but if there was any general desire for such a society the matter might be further looked into. Mr. Baxter, Dalkeith, in moving that no action be taken in the matter, remarked that as a rule foresters were thrifty, and connected themselves with existing benefit societies. Mr. Dewar, seconded the motion, which was agreed to. Mr. Methven being at the same time thanked for the trouble he had taken in the matter.

A number of presentations were intimated to the library, and in formally reporting the housing of the Society's forestry specimens in the Museum of Science and Art Mr. Dana said he understood that when the new wing of the museum was completed, one of the features of it would be a forestry collection. As the Museum had also the Society's and Society's specimens, the Director had also the nucleus of a first-rate collection.

A letter was read from the Secretary of the proposed mining, &c., exhibition at Newcastle-on-Tyne next year, which is to have a section devoted to woods, asking the Society to bring the exhibition before the members. A remit was made to the Council on the subject, a general feeling prevailing that the Society, as such, should not incur any financial liability in connection with the exhibition.

A conversation having taken place in regard to the place of next year's excursion—Upper Deeside being suggested—the arrangements for the excursion to Bate and Inverary were intimated, after which on the motion of Mr. J. Watt, Carlisle, the Executive of the Exhibition were thanked for the use of the committee-room.

THE EXCURSION.

The annual excursion of the members of the Scottish Arboricultural Society was commenced on Wednesday, August 4, under the most favourable circumstances. This year it had been arranged that a visit should be paid to the woodlands of the island of Bate and to the woods and policies of Inverary, permission for this purpose having readily been granted to the Society by the Marquis of Bute and the Duke of Argyll. The company, numbering over forty gentlemen, wearing badges of Scotch Fir, travelled from Edinburgh at 9 o'clock by train to Wemyss Bay, where they took boat for Rothessay.

At Rothessay the party was met by Mr. James Kays wood manager to the Bute estates, and carriages being in waiting, they drove to the "Queen's Hotel," when the Society was hospitably entertained to lunch by the Marquis of Bute. After visiting the ruined castle of Rothessay, and measuring the old Thorn tree near the chapel, the party drove to Mountstuart House, and spent the remainder of the day in inspecting the house, policies, and woods, and in taking measurements of the more remarkable trees. The grounds of Mountstuart have long enjoyed a reputation for great natural beauty, but they were a good deal devastated by storms in December, 1853, and January, 1854. On these occasions no fewer than 2000 trees were blown down, and damage otherwise done which it will take a lifetime fully to

repair. The bulk of the fallen timber, however, has now been removed, and already the signs of the wreck have been greatly covered by a luxuriant crop of bracken. Among other trees which were measured, the tape being passed in all cases round the trunk at a height of 5 feet, were a Douglas Fir, 5 feet 3 inches in circumference and 65 feet high; a Menzies Fir, 39½ feet high and 2 feet 7½ inches in girth; a Beech, 14 feet in girth, with a spread of branches of 66 feet; a Cedar of Lebanon, 6 feet 11 inches in circumference, with a straight bole up to 25 feet; a Californian Hemlock Spruce 1½ 43 feet high and 4 feet in girth; a Spanish Chestnut, 8 feet 5 inches in girth; a Pinus insignis, 3 feet 10 inches in girth; four Scotch Firs, from 8 feet to 8 feet 11 inches in girth. The trees seen were, perhaps, not so large as have been measured on other occasions, but one feature about them was the luxuriant way in which they were furnished with foliage. Several beautiful avenues of Limes and Beeches were traversed, and in the gardens the company was very much struck by some plants and shrubs growing in the open air, which generally only do so in such climates as that of the South of France or Spain. One feature, which gave great pleasure, was to view the "nursery park," which was laid out from the Marquis of Bute's original designs in 1871, and is in its way a perfect picture. The members of the Society had also an opportunity of seeing the colony of kangaroos which are kept in an enclosed 4 acres of wood; and the beaver wood, where the habits of this wonderful "woodcutter" may be studied. There are only a pair of beavers of a once considerable colony; but on a burn running through one of the woods may be seen an interesting series of dams built by these clever little animals, and signs all round of the manner in which they cut down the trees.

On Thursday morning the excursion party proceeded by the *Lord of the Isles* from Rothessay to Inverary, where they were met by Mr. John Loch, Chairman to the Duke of Argyll. On the way up Lochgilphead rain began to fall, and it was very wet for the rest of the afternoon. The party, however, nothing daunted, had a good four hours' walk through the Castle policies, and in the Duniquah woods, under the direction of Mr. John Stewart, forester. The whole district is beautifully wooded, a feature in the landscape which adds greatly to its effectiveness. Individually, as well as in the mass, the trees were considered by the arboriculturists well worthy of inspection. The policies are heavily timbered, many of the hard woods and Firs alike being handsome trees. A striking character of the trees on the lawn was their foliage, which extended from the topmost twig to the very ground. Many of those examined could not have been less than 300 years old, and were of great height and girth. Some of the measurements obtained were considered worthy of special note.

An old Ash on the Castle lawn girthed 15 feet 7 inches; a Beech, on a side of the river was 18 feet 6 inches in circumference, and upwards of 100 feet high; and a grand Plane at the narrowest part of its bole gave 14 feet 5 inches. So heavy Oaks and Spanish Chestnuts as those examined are not often seen in abundance on this side of the Border. Out of a large number of Oaks around which the tape was passed one measured 12 feet 11 inches in circumference, another 12 feet 10 inches, and 7 inches; while of the Spanish Chestnuts one was 17 feet 8½ inches in girth, a second, near the farm offices, measured 19 feet 9 inches. The stem of this tree was twisted like a rope, and not a few of its gnarled boughs were covered with the common Poly-pody. The soil, especially on the slopes of Duniquah, seems particularly suited to the growth of coniferous trees, the woods in that respect recalling to mind some of the best timber districts of Perthshire. There is a tradition that the Firs on Inverary were planted by Atholl men, and it can be said for them that they do credit to themselves and to the estate. They are of the true type of Scotch Fir, with thick scaly bark, and they have grown to a great size. One of the largest which was measured was 13 feet in girth and 116 feet high, and there were many others little inferior in bulk. A Larch which was tapped 10 feet 5 inches in girth and 130 feet high, the height in all cases being determined by dendrometer measurement, of great many magnificent Silver Firs were met with on Duniquah. One of these turned out to be the tallest tree measured. Its height was 144 feet, and its girth 13 feet 8 inches. One adjoining was 15 feet 3 inches in circumference, but not quite so high. The Spruces in the same locality were growing splendidly. One, which was planted fifty years ago, is now 80 feet in height, and girth 8 feet 4 inches. In the grounds are many memorable trees planted by royal and other distinguished personages. A melancholy interest attached to a Douglas Fir, the label on which told that it had been planted on September 31, 1875, by Prince Leopold. There was a Silver Fir planted by the Queen in 1875, which unfortunately has this year lost its leader, apparently by the depredations of squirrels. Several of the newer Conifers planted beside the old lime-kiln were found injured in the same way, though it were

hard to blame the little nut-crackers for all such damage. It should be mentioned that the Castle itself was thrown open to the party, the members of which greatly enjoyed the sight of the beautifully furnished apartments. The Loch Dhu Beech avenue having been examined, the party returned to Inverary about 7 o'clock, dripping wet; but they found comfortable quarters for the night at the "Argyle Arms" Hotel, and kindly attention on the part of the proprietor, Mr. Clark.

On Friday the weather had improved from that of Thursday; but rain fell in the forenoon while the members were pursuing their inquiries in the midst of this charmingly-wooded region. By 7 o'clock most of the party were afoot, and, under the direction of Mr. Taylor, visited the Castle gardens, which were found in excellent order. After breakfast, they left the "Argyle Arms" in conveyances, and enjoyed, despite the wet, a three hours' drive through the woods along the northern shore of Loch Fyne, which, like those previously visited, were found richly furnished with splendid trees. Taking their way by the famous Beech avenue which opens into the town, several trees were there tapped. One of the Beeches girthed 18 feet 6 inches, and there were not a few nor short of that measurement. The avenue has suffered a good deal of late by violent storms; but it was noted with satisfaction that the gaps were nearly all filled up with the same kind of trees. In the Killbride, Clonary, and Barrayrack woods the company had frequent occasion to admire the great size and quality of the Silver Firs, growing for the most part on the hillsides upon rocky soil. One of these is quite a historical tree, having been planted by the present Duke's grandfather, who commanded the Argyllshire Highlanders at Culloden. It is now a grand tree, running up 45 or 50 feet as straight as an arrow before forking, and girthing at 5 feet up 16 feet 4 inches. Mr. Kay's very handy dendrometer was tried upon it, and gave it a height of 121 feet. Another great Silver (in the Barrayrack wood) girthed 16 feet 10 inches, had a height of 133 feet, and by the usual calculations was estimated to contain 750 feet of serviceable timber. Among other trees around which the tape was passed in the course of the drive was what is known as the "Marriage Tree" (noted by Loudon, *Arboretum*, vol. iv, p. 2593, 2594), where a curious ingraft between two limbs of a Beech has taken place. At the narrowest part of the bole the girth was 15 feet 4 inches, and at 5 feet up it was 16 feet 2 inches. A very fine Sycamore was also measured, it being less remarkable for its size than for its beautiful head. Its girth, however, was by no means contemptible, the measurement giving 12 feet 8 inches. A fine lot of Oaks and Scots Firs were also met with the journey, which included a visit to an old Roman bridge on the Douglas Water still in a remarkably good state of preservation. In returning an opportunity was given to the party by Mr. Stewart, the forester, to see a number of young plantations. By violent gales within the last few years the Inverary woods, which extend to about 4000 acres, suffered very severely. Most of the blown timber has been removed, and to supply the gaps made a good deal of Douglas Fir—which seems to thrive here—has been planted on. On returning to Inverary the party broke up—some of the members going by coach to Dalmainy, while the larger portion of it came on by the *Lord of the Isles* to Glasgow and Edinburgh. *Scotsman*.

NATIONAL CARNATION and PICOTEE (NORTHERN DIVISION): August 14.

UNDER the most favourable circumstances the Northern growers of Carnations and Picotees held their annual show in the Botanical Gardens, Old Trafford, Manchester, on the above date. There was a very good exhibition indeed. It was a rare show for the North, and though occasionally a higher average of quality in the blooms might have been seen, at the same time not a few, distinguished by high characteristics of quality, were seen on that occasion, especially in the case of those produced by that well known raiser and cultivator, Mr. Robert Lord, of Todmorden. The Rev. F. D. Horner, the Hon. Secretary and Treasurer, informed us that the Carnation and Picotee had had on the whole a generous season in the North, as was shown by many of the flowers being of full substance and very bright. It was also pleasant to note as decidedly satisfactory that five or six new exhibitors had competed for the first time, and that some old ones who had not previously shown for a few years past had again put in an appearance with these flowers. There was a good attendance of those especially interested in the flowers. The day was beautifully fine.

CARNATIONS.

Four stands of twelve Carnations competed in the class, open to all, and Mr. Robert Lord, Hole Bottom, Todmorden—whose absence from ill-health was generally regretted—was 1st, with superb blooms

of the following:—C.B., Master Fred (Hewitt), a bloom of surpassing beauty; S.B., Melville (Doddwell); C.B., John Harland (Adams); S.B., Admiral Curzon; (Easom), this fine old flower in delightful character; R.F., Sybil (Holmes), perfect in development; C.E., J. D. Hextall (Simonte); P.F., Squire Meynell (Brabbin), a flower that must have been in cultivation nearly half a century; P.P.B., William Skiving (Gorton), a fine flower raised from seed supplied by Mr. E. S. Dodwell; S.B., Edward Adams (Dodwell); S.F., Sportsman (Hedderley), a brilliant sport, from Admiral Curzon, which appears to have become quite fixed in character; C.E., E. S. Dodwell (Hewitt); and R.F., Rob Roy (Gorton), in the finest character. 2d, Mr. B. Simonte, Rough Bank, Sheffield, with his fine P.F., James Douglas, a flower that ranks A 1 in this division; S.B., Tom Power, (Dodwell); R.F., Seedling; P.P.B., Seedling; C.B., Merer Fred (Hewitt); P.F., Mayor of Nottingham (Taylor); C.B., Mrs. Gorton (Dodwell); S.F., Sportsman (Hedderley); P.P.B., Sarah Payne (Ward); C.B., Seedling; R.F., Seedling; S.B., Robert Lord (Dodwell). 3d, Mr. George Geggie, Waterloo Nursery, Bury, 4th, Mr. F. Laws, Carnation Gardens, Rochdale.

Then came a class for twelve Carnations, nine at least to be dissimilar, open to growers of 500 pairs or less. Here Mr. John Whitham, Bank View, Hebdon Bridge, was 1st, with R.B., Master Fred (Hewitt), two blooms; S.F., Henry Cannell (Dodwell); P.F., George Melville (Dodwell); P.P.B., Sir Garnet Woseley (Hewitt); P.E., James Douglas (Simonte); C.B., Edward Adams (Dodwell), two blooms; C.B., Thomas Austiss (Dodwell); P.P.B., E. S. Dodwell (Hewitt); C.B., J. D. Hextall (Simonte); and S.B., Admiral Curzon (Easom). 2d, R. Gorton, Esq., President of the Society, Gildabrook, Eccles, Lancashire, with P.P.B., Geo. Melville (Dodwell); P.P.B., William Skiving (Gorton), two blooms; S.F., John Ball (Dodwell); P.P.B., Sarah Payne (Ward); P.F., Harrison Weir (Dodwell), two blooms; R.F., Sybil (Holmes); P.F., Squire Whithorn (Dodwell); S.F., Robert Morris (Dodwell), and the rest unnamed. 3d, Mr. E. Shaw, Moston, near Manchester. 4th, Mr. William Taylor, Middleton, Lancashire. Eight collections competed in this class.

The class for six Carnations was confined to growers of 250 pairs or less, and here Samuel Barlow, Esq., 1st, Stake Hill House, Astleton, Manchester, was 1st, with excellent blooms of S.B., Robert Houlgrave (Barlow), a fine bright full flower of striking character; S.F., Dan Godfrey (Holmes); R.F., John Keat (Whitehead); S.B., Admiral Curzon (Easom); P.F., Squire Meynell (Brabbin); and P.P.B., Sir Garnet Woseley (Hewitt). 2d, Mr. Thomas Madock, Loftbooth Hall Gardens, Wakefield, with S.B., Seedling; R.F., Sybil (Holmes); C.B., J. D. Hextall (Simonte); P.P.B., Falcoberrie (May); S.B., Admiral Curzon (Easom); and S.F., Sportsman (Hedderley). 3d, Mr. J. Bleackley, Prestwich, Manchester; 4th, Mr. S. Lord, Healing Hall, Rochdale; 5th, Mr. William Bacon, Derby; 6th, Mr. Kitching. Eight stands competed in this class.

In the various classes for single blooms a large number of flowers were staged. S.B.'s were numerous and brilliant. The best was Admiral Curzon (Easom), from Mr. R. Lord; and he was 2d with Fred (Hewitt); Mr. S. Barlow was 3d and 5th, with Robert Houlgrave; and Mr. R. Lord 4th, with Master Stanley (Dodwell). C.B.'s were very fine. The winning blooms were massive and brilliantly coloured, and Mr. R. Lord was 1st, 2d, 3d, and 5th, with Master Fred (Hewitt), probably one of the richest coloured C.B.'s in cultivation; and Mr. Geggie 4th, with the same. The 1st prize for P.P.B.'s was won by Mr. R. Lord, with a fine bloom of Gorton's William Skiving, Mr. B. Simonte being 2d with Mr. S. Lord (Dodwell), and 3d with William Skiving; 4th, Mr. J. Bleackley, Prestwich, Lovells, Birmingham, with Sarah Payne (Ward); 5th, Mr. R. Lord, with E. S. Dodwell (Hewitt).

The best P.F. was James Douglas (Simonte), extra fine; Mr. J. Whitham being 2d, with the same; Mr. T. Helliwell, Todmorden, was 3d, with Dr. Foster (Foster); Mr. R. Lord 4th, with Mayor of Nottingham (Taylor); and Mr. Geggie 5th, with James Douglas.

The best S.F. was Clipper (Fletcher), shown by Mr. R. Lord; Mr. Geggie being 2d and 3d, with Annihilator (Jackson); 4th, Mr. R. Lord; 5th, with R. Lord; 6th, Mr. R. Lord being 5th, with Ivanhoe (Lord).

All the five prizes for R.F.'s went to Sybil (Holmes), beautiful flowers being shown, Mr. S. Lord, with 1st and 2d, Mr. R. Lord 3d and 5th, and Mr. T. Helliwell 4th.

The premier Carnation was C.B., Hewitt's Master Fred, shown by Mr. Robert Lord, a grandly developed flower.

There was a class for twelve self or fancy Carnations, and but two prizes were awarded, though three stands competed. Mr. R. Gorton was 1st, with a stand of flowers, all self coloured but very fine in quality; Mr. F. Law 2d, having a few fancy varieties mixed with selfs, but neither lot was named.

PICOTEE.

The next class was for twelve Picotees, nine at least to be dissimilar; open to growers of 500 pairs or less, and here Mr. J. Whitham was 1st out of seven competitors, with a good stand consisting of H.P., Zerlina (Lord); L.P., Clara Penson (Willmer); H.R., John Smith (Bower); H.R., Lady Holmesdale (Schofield); L.R., Miss Wood (Wood); H.R., Edith d'Ombrin (Turner); L.P., Ann Lord (Lord); L.R., Thomas William (Flowdy); H.P., Mr. A. Braccator (Turner); L.P., Ann Lord (Lord), H.P., J. B. Chyner (Ingram); H.P., Zerlina (Lord). 2d, Mr. E. Shaw, with good blooms of H.P., Muriel (Hewitt); H.S., Mr. R. L. Todd; L.R., Miss Wood (Wood); H.R., John Smith (Bower); H.R., H.R. Valentia (Kirtland); L.P., Clara Penson (Willmer); H.P., Muriel (Hewitt); L.R., Daisy (Dodwell); H.R., Miss Hyver (Lord); H.R., Mrs. Dodwell (Turner); L.B., Thomas William (Flowdy); H.R., Elise (Kirtland). 3d, R. Gorton, Esq.; 4th Mr. W. Taylor.

There were ten competitors in the class for six Picotees, confined to growers of 250 pairs or less, and here Mr. T. Helliwell was 1st with H.R., Brunette (Kirtland); H.R., Mr. R. Lord (Lord); L.P., Clara Penson (Willmer); H.P., Alice (Lord); H.P., Fanny Hele (Niven); and L.R., Miss Wood (Wood). 2d, Mr. J. P. Sharp, with H.P., Muriel (Hewitt); H.R., Mrs. Sharp (Sharp); L.R., Thomas William (Flowdy); H.R., Mrs. Payne (Fellows); L.R., Seedling; and H.P., Zerlina. 3d, Mr. J. Bleackley; 4th, S. Barlow; 5th, Mr. J. Edwards; 6th, Mr. W. Kamshill, Wakefield.

In the classes for Picotees, single blooms, there were a great number of flowers staged. The H.R. class Mr. R. Lord was 1st, 2d, and 3d, with John Smith (Bower), and Mr. Geggie 4th and 5th with Henry (Matthews); L.R.: Flowdy's Thomas William won all the prizes in this class; Mr. B. Simonte was 1st, and Mr. R. Lord 2d, 3d, 4th, and 5th. H.P.: Mr. F. Law was 1st, 2d, and 3d, with Zerlina (Lord); Mr. Geggie 4th, with Muriel (Hewitt); and Mr. T. Helliwell 5th, with Mrs. Niven (Niven). L.P.: Mr. T. Helliwell was 1st, with Clara Penson (Willmer); Mr. J. Whitham 2d, with the same; and Mr. S. Barlow 3d, with the same; Mr. R. Gorton was 4th and 5th, with Ann Lord (Lord). H.R.: Mr. R. Lord was 1st, with Fanny Helen (Niven); Mr. J. Sharp 2d, with his Mrs. Sharp; Mr. R. Lord 3d, with Lady Louise; 4th, with Mrs. Sharp; and 5th, with Edith d'Ombrin. In the class for L.R. edges, Favourite (Liddington) was 1st and 2d, shown by Mr. R. Lord; 3rd and 4th, shown by Mr. B. Simonte; Mr. R. Lord being also 5th with Mrs. Aldcroft.

The Premier Picotee was L.R., Favourite (Liddington), shown by Mr. R. Lord in his stand of twelve blooms.

Four stands of twelve dissimilar Picotees competed for the four prizes open to all, and Mr. Robert Lord was 1st, with very fine blooms of H.R., Master Norman (Norman); L.R., Favourite (Liddington), perhaps the most highly finished flower in the whole show; H.P., Zerlina (Lord); L.R., Thomas William (Flowdy); H.S., Mrs. Sharp (Sharp), a beautiful new variety; H.R., Fanny Helen (Niven); L.P., Mary (Simonte); H.R., John Smith (Bower); H.R., Mrs. Payne (Fellows); L.P., Ann Lord (Lord); L.R., Mrs. Aldcroft (Turner); H.P., Muriel (Hewitt). 2d, Mr. B. Simonte, with L.R., Favourite (Liddington); H.R., Seedling; L.R., Clara (Bower); H.R., Lady Holmesdale (Schofield); H.R., Princess of Wales (Fellows); L.P., Clara Penson (Willmer); H.S., Mrs. Sharp (Sharp); L.P., Mrs. Gorton (Simonte); L.P., Ann Lord (Lord); H.R., Seedling; L.P., Mary (Simonte); H.P., Zerlina (Lord); 3d, Mr. G. Geggie; 4th, Mr. F. Law.

CERTIFICATES.

First-class Certificates of Merit were awarded to S.B. Carnation, Robert Houlgrave (Barlow), shown by S. Barlow, Esq., a very fine and bright flower, regarded as an improvement upon Admiral Curzon; and to H.S.-edged Picotee, Mrs. Sharp (Sharp), shown by Mr. R. Lord, a flower of fine build, pure in the ground, and heavily edged with bright scarlet. A similar award was made to this flower at the meeting of the Oxford Union held at Mr. E. S. Dodwell's in 1885.

Messrs. James Dickson & Sons, the Upton Nurseries, Chester, sent a large collection of Carnations and Picotees nicely set up in bunches, and a number of various hardy perennials, which attracted a good deal of notice from visitors.

WESTON-SUPER-MARE: August 10.

THIS Society held its annual show in the Grove and Rectory Field on the above date. Rain fell heavily in the morning, but it ceased about 9 o'clock, and the weather during the remainder of the day was every thing that could be desired for the holding of such an exhibition, and the show, as the whole was an excellent one. The most noteworthy plant in the exhibition, and perhaps the finest of the kind ever before saged, was *Ixora Duffii*, staged by Mr.

Cypher, of Cheltenham, having thirteen trusses, each 10 inches in diameter, of bright orange-scarlet flowers and luxuriant foliage.

PLANTS.

Mr. Cypher was 1st for twelve stove and greenhouse plants, showing a grand lot of highly-coloured Crotons and grandly flowered *Ericas*, &c. Mr. Lock, gr. to W. B. Cleave, Esq., Newcombe House, Crediton, was a good 2d, and Mr. Willis, gr. to Mrs. Pearce, The Firs, Basset, 3d—the latter showing a superbly flowered *Statice profusa* in his collection.

Mr. Willis was 1st for six flowering plants, and Mr. C. Jones 2d, both showing well. Mr. Hughes, gr. to 11, Pethick, Esq., had the best four flowering plants; Mr. Holland, gr. to W. Ash, Esq., the 2d best, and Mr. Lewis the 3d, all three showing well.

Mr. Hughes was 1st for a specimen greenhouse plant, and Mr. Lock was 2d; the last-named exhibitor had the best six ornamental foliage plants, showing an excellent lot, being followed closely by Mr. Cypher. Mr. Willis and Mr. Brooks were 1st and 2d respectively for six exotic Ferns. Mr. Lock and Mr. Derryman, gr. to E. Cole, Esq., taking 1st and 2d in that order for eight exotic Ferns, clean well grown plants being staged in both collections.

FELARGONIUMS.

These were shown largely and in some classes remarkably well, notably in that for six zonals, which were grandly flowered. 1st, Mr. Adams; 2d, Mr. Brooks. *Fuchsias*, *Begonias*, *Coleus*, &c., were also pretty well represented.

CUT FLOWERS.

Roses were very good for the time of the year, the Campbell, gr. to Dr. Budd, Bath, was 1st for twenty-four trebles; Mr. Matlock, Oxford, being a close 2d; and Mr. Yorkshire a good 3d.

Mr. Hobbs, Bristol, had the best twelve blooms, and Mr. Warden, gr. to Sir F. H. Bathurst, Bart., Clarendon Park, Salisbury, the second best.

Mr. Campbell was 1st for a like number of Teas, being followed closely by Mr. Matlock and Messrs. Cooling & Sons, Bath.

BOUQUETS.

were well shown, equal 1st going to Mr. Cypher and Messrs. Perkins & Sons, and the 3d and 4th to Mr. Garraway, Bath, and Mr. Cole in that order.

COLLECTIONS OF FRUIT.

There were four collections of eight kinds put up in competition for the three prizes offered, the three prize winners being very close to each other in point of merit. 1st, Mr. W. Iggulden, gr. to the Earl of Cork, Marston House, Frome; 2d, Mr. W. Nash, gr. to the Duke of Beaufort, Badminton House, Chippenham; 3d, Mr. H. W. Ward, Longford Castle, Salisbury. Mr. Iggulden's collection consisted of good *Cayenne* Pine, Black Hamburg and Foster's Seedling Grapes, well-coloured Barrington Peaches, Victoria Nectarines, Hero of Lockinge Melon, Moor Park Apricot and Brown Turkey Figs. Mr. Nash's best dishes were Bellegrave Peaches, large and highly coloured, and Black Tartarian Cherries, very fine; and Mr. Ward's best were a Queen Pine, Muscat Grapes, and Blenheim Orange Melon, 6½ lb., beautifully netted and well coloured.

GRAPES.

These were shown in fairly good condition. Mr. H. W. Ward was easily 1st for three bunches of Muscats; Mr. G. Neton and Mr. Iggulden being 2d and 3d.

Mr. Thomas was 1st for a like number of bunches of any other white variety with good Buckland Sweet-water; Mr. Lloyd, gr. to J. Stuckley, Esq., was 2d, with good Foster's Seedling; and Mr. Nash was 1st for another black table Hamburg with three fine well finished bunches of Black Alicante. Mr. Duffern, gr. to Mrs. Walker, and Mr. Lloyd taking 2d and 3d in that order with good bunches of Madresfield Court, but which were wanting in colour.

Mr. W. Yard, gr. to the Rev. Canon Pratt, was 1st for Black Hamburgs, showing rather loose but fairly coloured bunches; Mr. Moss was 2d, and Mr. Edwards 3d, with compact, even, well finished though smaller bunches.

There were only two Pines staged, a large Black Pine, 8½ lb., but not in good condition; and a medium-sized *Cayenne*, for which Mr. Iggulden was awarded a 1st prize.

MISCELLANEOUS.

Twenty fruits of green and scarlet fleshed kinds of Melons were put up. Mr. Goddard was 1st in the latter class with *Nead's*, and Mr. Holland obtained a like award in the former with Sutton's Horticultural Prize. Mr. Ward had the best dish of Peas in Jarzelle, and Mr. Nash the best dish of Cherries with Black Tartarian.

Mr. Duffern had the best Peaches and Nectarines, the latter being large and highly coloured fruits of *Etage*; Mr. Lloyd taking 2d with large fruits of Oldenburg.

Mr. Ward exhibited, not for competition, a handsome piece of Hero of Lockinge Melon, weighing 4½ lb., rich in colour and beautifully netted.

VEGETABLES.

These were shown largely and well. There were eight good collections put up. 1st, Mr. Filchey, gr. to Colonel Colgrave; 2d, Mr. J. Hall; 3d, Mr. W. A. Harris, gr. to Colonel J. A. Law.

Mr. Ward was 1st for Cauliflower. Mr. J. Day was the most successful exhibitor in the single dish classes.

Potatos, Carrots, Marrows, Tomatos, and saladings were well represented.

HASTINGS AND ST. LEONARDS:

August 11.

The annual exhibition of this Society was held in the Alexandra Park. The entries scarcely equalled those of last year in numbers, but if deducted on this point there was no falling off in the quality of the exhibits, which were good throughout, many a deserving collection having to be passed over where the competition was strong; notably was this the case with vegetables, which were among the very best that we have seen this season. A word of praise, too, is due to the superior quality of the vegetables and cut flowers shown by the cottagers of the district, each of which evinced high cultivation.

PLANTS IN FLOWER.

These are always a strong feature at this show, and this occasion was no exception to the rule. In the open classes Mr. Portnell, gr. to Sir A. Lamb, Beaport, was well in advance with eight plants of moderate size, fresh and healthy and in abundant bloom, his most notable examples were *Dipladenia amabilis*, very fine, with flowers of exceptional size; *Isora Brasen*, *Bougainvillea glabra*, lot of flower; *Erica cernithoides coronata*, with examples of *Kalosanthes coccinea superba* *Erica*, *Atonia turgida*, and *Statice imbricata* var. *Gilbertii*. Mr. Hobden, Clive Vale Nursery, was a good 2d, staging one of the best flowered plants of *Allamanda grandiflora* we have seen, and a well done piece of *Rondeletia speciosa major*, a plant not nearly so much grown as it deserves to be.

For six specimens, Mr. Lucas, gr. to C. Liddle, Esq., Peasmarsh, was 1st, having among others a good example of *Vinea oculata*; in the 2d prize collection, from Mr. Duffern, gr. to S. Green, Esq., was an unusually bright and well flowered plant of *Kalosanthes coccinea superba*.

In the limited classes, Mr. Portnell again came to the front with another good collection of six plants, conspicuous among others being a capital example of *Erica Fairriana*, and also of *Statice profusa*.

Single specimens in flower were shown in excellent condition, equal 1st prizes being awarded to another well done *Allamanda grandiflora* from Mr. Hobden and an all-round plant of *Bougainvillea glabra* from Mr. Portnell.

Felargoniums, both single and double zonals, were displayed in capital condition, the plants healthy and floriferous, and, what was equally creditable, not too stilly trained.

Mr. Hobden took 1st for both sections in six of each, Mr. Portnell following closely in each instance.

Gloxinias were shown in first-rate order, full of flower, and in good variety by Mr. Gadd, gr. to P. Eagles, Esq., St. Leonards; and Mr. Gregory, gr. to Admiral Maxse, Eastbourne; the first-named also taking 1st for four *Begonias*, most abundantly flowered.

Ericas were shown in considerable numbers, consisting of the best varieties for the season. Mr. Portnell taking two 1sts for six and four respectively.

For six *Fuchsias* the same exhibitor was likewise 1st, with healthy vigorous plants of the best kinds.

Some pretty examples of dinner-table plants were shown, the best coming from Mr. F. Bishop, Croydon.

Foliage plants and Ferns were shown in considerable number, being, with one or two exceptions, of medium size, but in good condition. For eight foliage plants Mr. Jupp, gr. to the Mayor of Eastbourne, was 1st, having among others a very fine plant of *Croton majesticum*, brilliantly coloured; and *Alcasia Thibautiana*, in good condition. Another collection, strong in Palms, came from Mr. Portnell, and took 2d place.

The best specimen foliage plant was a grand piece, in robust health, of *Areca sapida*, from Mr. Dennis.

For eight Ferns Mr. Bolton, of Coombe Bank, Sevenoaks, took the 1st place with a noble plant of *Dicksonia squarrosa* and a good specimen of *Davallia polyantha* in his collection; Mr. Jupp followed, having some well grown *Gymnogrammas* and a fine *Asplodia excelsa*.

In a smaller collection Mr. Morris, gr. to C. J. Edden, Esq., came to the front with neat well grown plants.

In a miscellaneous collection of plants the 1st prize again fell to the lot of Mr. Portnell, in whose collection we noticed a healthy specimen of *Rhopala corcovadensis*.

CUT FLOWERS.

These in their various classes were shown in considerable numbers, and of excellent quality. The central portion of the marquee was devoted to the table decorations, each exhibitor being allowed a separate table, around which there was plenty of room for inspection by the visitors.

In the open class, Mrs. Seale, of Sevenoaks, won the 1st prize with three stands, even beyond her usual degree of excellence; the 2d prize being well won by Mrs. Bishop, of Croydon.

For the prizes restricted to amateurs only, Mrs. Gilmour, of Hawkhurst, took 1st place with three stands, light but free in their arrangement; but was closely followed by a local exhibitor, Miss Stewart, St. Leonards, whose only failing was in not having secured a ground work of moss to start upon, the stand being plainly visible.

Boxes of Roses were exhibited in good numbers, Messrs. Woollard, Cooksbridge Nursery, Lewes, and Mr. Slaughter, of Steyning, taking the premier positions.

Stove and greenhouse cut flowers made a good show, *Lapagerias*, *Ericas*, *Dipladenias*, and *Allamandas*, were prominent features in the 1st prize lot from Mr. Portnell; a capital boxful being also shown by Mr. Nicholls.

Amongst *Dahlias*, Mrs. Seale and Mr. Robinson, gr. to Mrs. Meryon, Kye, shared the honours with bright fresh flowers.

Mr. Bunyard, of Ashford, won the 1st prize for twelve *Gladioli*, and Mr. Morris that for six, each with good spikes.

Asters and *Phlox Drummondii* were shown in considerable quantity, the latter from Mr. Lavender, gr. to Lieut.-Col. Tulloh, St. Leonards, being very fine.

Bouquets and baskets of flowers produced a lively competition, Mrs. Bishop, Mr. Woollard, and Mr. Freeman, being the most successful exhibitors.

FRUIT.

The Grapes were a prominent feature in this department, Mr. Allen, gr. to Lord Brassey, winning easily with three bunches of Muscat of Alexandria, finely coloured, and taking 2d also for Black Hamburg, with good bunches and very fine berries; the 1st being awarded to Mr. Gadd with better coloured samples, more compact in the bunch.

Of Melons, Lord Beaconsfield (green) and Blenheim Orange (scarlet) were prominent, each kind being to the front in each of four classes, and Mr. Eagleton the most successful exhibitor.

For a collection of eight dishes of fruit Mr. Portnell again came to the front, winning with a nice even lot of fruit.

Peaches and Nectarines were hardly sufficiently advanced, still some good dishes of each were brought forward—Royal George of the former, and Downton of the latter were the best.

VEGETABLES.

Collections of nine sorts were shown in first-class condition, each of the nine exhibitors staging productions of a high order of merit—Mr. Crossman, of Coghurst Hall, and Mr. Apps, of Ore, taking 1st and 2d prizes respectively; these were among the very best collections that we have seen this season. The vegetable classes throughout were well represented in each respective kind, Celery being remarkably good for the season; so also were the Carrots (Sutton's new Red Intermediate, very fine); some fine bulbs also of Rousham Park Onion were shown Messrs. Sutton, Apps, and Gilmour being the chief prize-takers.

Mr. Gilbert, of Springfield Nursery, Old London Road, Hastings, staged a most effective group, not for honours, of choice flowering and foliage plants, occupying the entire end of one tent.

TAUNTON DEANE HORTICULTURAL SHOW: August 12.

The display of horticultural productions brought together in the Vivary Park is such as to place the exhibitors of this Society at the front rank of provincial gatherings. In each department the competitors are usually numerous, whilst the character of the productions is of a description to give conclusive evidence that gardening is well done in this part of the country. The show day is kept as a general holiday in the town, to which the inhabitants of the

surrounding districts flock in large numbers, thronging the six or seven roomy tents in a way that is rarely seen. On the present occasion stove and greenhouse plants, both flowering and fine-foliaged, were, as usual at Taunton, represented in a manner that is not surpassed at any summer exhibition in the kingdom.

OPEN CLASSES.—STOVE AND GREENHOUSE PLANTS.

Mr. Cypher, Cheltenham, took the lead, his group consisting of an *Ixora Duffii*, which bore thirteen heads of bloom, the largest of which was 10½ inches through; the plant was covered with healthy leaves down to the pot; J. Pilgrim, and I. Fraser, each bearing from 130 to 140 trusses of their reddish-orange flowers, and a number of other subjects of great merit. Mr. Lock, gr. to E. W. Cleave, Esq., Crediton, who was 2d, had amongst others, an immense plant, well-flowered, of *Erica Sweriana*, and *Eucharis amazonica*, bearing about forty-five spikes; 3d, Mr. Wills, gr. to Mrs. Pearce, Southampton.

Six stove and greenhouse plants.—1st, Mr. Cypher.

FINE-FOLIAGE PLANTS.

These were very well shown, the plants large and in excellent condition; Mr. Lock took 1st honours with eight, his best specimens being *Lalania borbonica*, *Eucephalatos villosus ampliatius*, and *Kentia Behnoeana*, each some 15 feet across, with *Croton Warrenti* and *C. Willdianii*, large, and beautifully coloured; and *Gleichenia splendens*, 9 feet in diameter; 2d, Mr. Cypher, in a good group having *Kentia Canterburyana*, and a very fine specimen of *Cordyline indivisa*.

FERNS.

Eight exotic varieties.—Mr. Lock took 1st with a fine collection, in which was *Davallia polyantha*, D. Mooreana, and the beautiful *D. fijiensis*, with *Cyathea dealbata*, and a very fine specimen of *Marattia Cooperi*; Mr. Wills, who was 2d, staged nicely grown but smaller plants.

ORCHIDS.

Four Orchids.—Mr. Cypher was the only exhibitor of these, taking 1st with *Scacelabium Blumei*, bearing five spikes; *Cypripedium Stoecki*, *Cattleya Dowiana*, and *Oncidium Lanceanum*.

RARE OR NEW PLANTS.

One new or rare plant in bloom.—1st, Mr. Lock, with *Dipladenia Eliotti*, a distinct variety, with full-sized flowers, the segments unusually broad; the colour is a rich salmon-red, edged with white; in the leaves, deep green, are comparatively small, thick, and leathery.

With a new fine-foliage plant Mr. Lock was also 1st, having *Alocasia Sanderiana*; 2d, Mr. Cypher, with *Croton mortefontaineensis*.

FUCHSIAS.

The best of these came from Mr. Godding, Taunton; 2d, Mr. Henley, gr. to F. Woodland, Esq.

TUBEROUS BEGONIAS

were well shown, Mr. Godding being 1st, with large, well-flowered plants of good varieties; 2d, Mr. S. Tottle, Taunton.

ZONAL PELARGONIUMS.

These were well represented, the plants of medium size, and beautifully flowered. With eight single varieties Mr. Godding took the lead; 2d, Mr. S. Tottle.

Eight Nosegays.—1st, Mr. Godding, who here again staged beautifully flowered examples.

Eight double zonals.—1st, Mr. Henley; 2d, Mr. Lewis, gr. to J. E. Cole, Esq.

Eight tricolors.—1st, Mr. T. Tidbury, Taunton; 2d, Mr. Godding.

COCKSCOMBS.

With four Mr. Cowill, gr. to H. F. Manley, Esq., Taunton, was 1st; 2d, Mr. Keed, gr. to F. J. C. Parsons, Esq., Bridgewater.

AMATEURS.

Twelve stove and greenhouse plants.—Mr. Wills was placed 1st, having a group composed of eight fine-foliage and four flowering specimens; Mr. Lock 2d, his collection consisting of all flowering plants, medium sized examples in nice condition.

Six stove and greenhouse plants.—1st, Mr. W. Marshall, Taunton, who with others had a nice specimen of *Rondeletia speciosa* major.

Four stove and greenhouse plants.—1st, Mr. Wills; 2d, Mr. Marshall.

FINE-FOLIAGE PLANTS.

1st honours for six went to Mr. Lock, who in a nice half dozen had a good example of *Alocasia Thibautiana*; 2d, Mr. Wills.

FERNS.

Exotic Ferns.—Here again Mr. Lock was 1st, with medium-growing varieties, amongst which were well-managed examples of *Davallia Tyrermannii*, *Gleichenia rupestris*, and *Adiantum trapeziforme*; 2d, Mr. Lewis.

Hardy Ferns were well shown, Mr. Lock taking 1st, with twelve fresh, well-grown plants; 2d, Mr. Wills.

LILIES

were shown in nice condition, Mr. Marshall taking 1st with the white and spotted varieties of *L. speciosum*; 2d, Mr. F. W. Newton, Taunton.

LYCOPODIUMS.

These also were present in beautiful order, Mr. Lock taking 1st, and Mr. F. W. Newton 2d.

ACHIMENES

were better done than we often see them, Mr. Marshall being 1st for four, with *Mauve Perfection*, *St. Margaret*, *Dazzle*, and *Ambrose Verschaffelt*; 2d, Mr. Parish, gr. to Mrs. Eden, Taunton.

BEGONIAS.

Here, as in the open class, these were well shown; Mr. W. B. Hellard taking 1st, and Mr. Woodland 2d.

GLXONIANS

were in excellent condition, Mr. Cooper, gr. to C. L. Collard, Esq., being 1st with erect flowered varieties; 2d, Mr. Lock.

ZONAL PELARGONIUMS.

In the class for six Mr. Woodland had 1st, with beautifully bloomed plants; 2d, Mr. Hellard. Double zonals.—1st, Mr. Hellard; 2d, Mr. Woodland.

CUT FLOWERS.

Roses were in good condition, taking into account the advanced season.

Forty-eight varieties, single blooms.—Mr. Mattock was well in front, putting up a clean lot of flowers; 2d, Mr. Campbell, gr. to S. P. Budd, Esq.

Twenty-four varieties, three blooms of each.—1st, Mr. Campbell; 2d Messrs. Cooling, Bath. Mr. Mattock would have been 1st in this class also but for the unfortunate mistake of staging two sets of *Alfred Colomb*; mistake it clearly was, as both trees were labelled correctly. An extra prize was awarded to the stand.

Twenty-four Dahlias.—Messrs. Keynes & Co., Salisbury, secured 1st honours, staging splendid flowers, conspicuous amongst which were *William Bainbridge*, *Joseph Ashley*, *Harry Keith*, *Spirifer* and *Defiance*; the last named is a seedling, a medium sized flower of beautiful form, the colour is a peculiar shade of scarlet; 2d, Mr. Nation, Taunton.

Twelve Dahlias.—1st, Messrs. Keynes, again showing beautiful flowers; 2d, Mr. Nation.

Twelve fancy Dahlias.—1st, Messrs. Keynes; 2d, Mr. Nation.

Twelve single Dahlias.—1st, Mr. Mattock, with a very good dozen, very distinct in colour; 2d, Messrs. Keynes.

Twenty-four Hollyhocks.—1st, Mr. W. Smith, Bristol, with better flowers than we have been in the habit of seeing for some time.

Twelve Hollyhocks.—1st, Mr. Smith; 2d, Mr. Jones, gr. to J. S. Pope, Esq., Bath.

Twenty-four German Asters.—These were very well shown, Mr. Jones taking 1st, with a beautiful stand; 2d, Messrs. Cooling.

Twenty-four French Asters.—1st, Mr. Jones, here also staging a good lot of blooms; 2d, Messrs. Cooling.

Twenty-four Gladioli.—1st, Mr. Godding; 2d, Mr. S. Tottle.

Twelve varieties of stove and greenhouse flowers.—Here Mr. Lock took 1st, with an excellent stand.

TABLE ARRANGEMENTS.

Of a dinner-table arranged in the usual style Miss Cypher was the only exhibitor, and took 1st; Miss Cypher likewise had a well-merited 1st for a stand of flowers, Mrs. E. Blake, Taunton, being 2d.

FRUIT.—COLLECTION OF TEN KINDS.

Fruit was present in quantity, and mostly in good condition. Mr. Iggulden, gr. to the Earl of Cork, Frome, was well in front, showing good examples of Black Hamburg and Foster's Seedling Grapes, Barrington Peaches, Lord Napier Nectarines, Moor Park Apricots, Brown Turkey Figs, a Smooth Cayenne Pine, Black Tartarian Cherries, Jargonelle Peas, and a Melon; 2d, Mr. Ward, gr. to the Earl of Radnor, Longford Castle, Salisbury, who also had a good collection; 3d, Mr. Crossman, gr. to J. Brutton, Esq.

Eight dishes.—1st, Mr. Lloyd, gr. to V. Stuckey, Esq., who, amongst others, had Foster's Seedling Grapes, good bunches, finely coloured; Oldenburg

Nectarines, Violette Hative Peaches, Moor Park Apricots, and a Melon; 2d, Mr. Crossman, whose best dishes were Waterloo Peaches, Madresfield Court Grapes, and Pitmaston Orange Nectarines.

Four dishes.—1st, Mrs. Walker, who had Madresfield Court Grapes, Grosse Mignonne Peaches, Elrige Nectarines, and Royal Hybrid Melon, all in nice condition; 2d, Mr. Iggulden, his best examples being Muscat of Alexandria Grapes and Grosse Mignonne Peaches.

Two Pine-apples.—1st, Mr. Brooks, Dillington Park, Ilminster, who showed a pair of Queens; 2d, Mr. Iggulden.

Three bunches of Black Hamburg Grapes.—1st, Mr. Iggulden, with well-coloured examples a little thick of bloom; 2d, Mr. W. K. Wait, Bristol.

Three bunches of black Grapes, not Hamburg.—1st, Mrs. Walker, who had Madresfield Court—fine bunches and good berries, just a shade short of colour; 2d, Mr. Crossman, with Black Alicante.

Three bunches of Muscats.—1st, Mr. Ward, with Muscat of Alexandria; 2d, Mr. W. K. Wait.

Three bunches of white Grapes, not Muscats.—1st, Mr. Westacott, with Duke of Buccleuch—handsome bunches, in beautiful condition; 2d, Mr. Lloyd, who staged good examples of Foster's Seedling.

One Melon.—1st, Mr. T. Faulk.

Dish of Peaches.—1st, Mrs. Walker.

Dish of Nectarines.—1st, Mrs. Walker.

Dish of Apricots.—1st, Mr. F. W. Newton.

CERTIFICATES.

Mr. Lock was awarded a First-class Certificate for *Croton Cleave*, a distinct and very handsome variety; the leaves are much like *C. Disraeli* in shape, but quite three-fourths of the entire surface is bright yellow, the leaf-stalks are deep crimson; altogether it is a very fine kind.

Messrs. Kelway received a First-class Certificate for new *Gladioli Gabinus*, a full-sized flower, ground colour pale peach blossom, shaded with pink; *Lady Salisbury*, a fine shaped flower, ground colour white, barred and shaded with crimson, a conspicuous white throat; *Dr. Farrant*, white centre, outer portion of petals shaded with bright crimson.

Messrs. R. Vetch, of Exeter, staged, not for competition, a good collection of miscellaneous flowering and leaf leaved stove, greenhouse, and other plants, including Orchids.

Messrs. Kelway contributed, not for competition, a very fine stand of *Gladioli*.

NATIONAL GOOSEBERRY SHOW, OLD TRAFFORD: August 2.

We append a list of the exhibitors and the weight of the various fruits shown on this occasion. The meeting took place in the Botanical Gardens, Old Trafford, Manchester:—

DISHES OF TWELVE BERRIES. RED VARIETIES.

Exhibitor.	Name of Berry.

James Leicester, Crompton Road Nurseries, Macclesfield, Secretary.

YEOVIL HORTICULTURAL.

THE annual show of this Society was held on Tuesday last, the 17th inst., in unfavourable weather, and under dispiriting circumstances. Last year a little over £100 was taken as gate money, and there was an adverse balance of about £21. It is feared this year that instead of "making up" and "wiping off," the gate money will show a falling-off equal to last year's deficit. This is to be regretted, for the show was very creditable, and a number of influential persons sent contributions from a distance; the Earl of Cork sending fruit from Marston, and Mr. Brinsley Sheridan sending from Frampton, in Dorset. Messrs. Keynes sent Dahlias, and Mr. Drax, of the West Park, a variety of garden products. Cottagers sent especially well grown vegetables, and many monstrous size Potatoes, showing a preference for Reading Russets.

Aug. 12.—Fine day, frequently dull; fine night.
 13.—Rain early in morning and a little before noon, dull till after 9 p.m., then fine.
 14.—Very dull till 1 p.m.; fine afternoon, sun shining.

Aug. 15.—A very fine day throughout.
 16.—Rain early in morning, a fine day afterwards, but generally dull.
 17.—Fine; a slight shower in morning, dull generally.
 18.—Fine day, but very little sunshine; maximum temperature took place late in the afternoon; fine night.

LONDON: Atmospheric Pressure.—During the week ending August 14, the reading of the barometer at the level of the sea increased from 29.97 inches at the beginning of the week, to 30.05 inches by 9 A.M. on the 8th, decreased to 29.66 inches by P.M. on the 10th, increased to 30.06 inches by the morning of the 12th, decreased to 29.53 inches by 1 P.M. on the 13th, and was 30.00 inches at the end of the week.

The mean reading of the barometer for the week at the level of the sea was 29.89 inches, being 0.07 inch lower than last week, and 0.05 inch below the average of the week.

Temperature.—The highest temperature in the shade in the week was 75° 5 on the 8th; and on the 10th the highest was 63°. The mean of the seven high day temperatures was 67° 3.

The lowest temperatures in the week was 46° 5 on the 12th; and on the 8th the lowest was 62° 4. The mean of the seven low night temperatures was 54° 6.

The greatest range of temperature in one day was 20° 3 on the 12th; the smallest was 9° 0 on the 10th. The mean of the seven daily ranges was 12° 7.

The mean daily temperatures were 62° 6 on the 8th; 64° 7 on the 9th; 59° 1 on the 10th; 56° 9 on the 11th; 56° 3 on the 12th; 61° 6 on the 13th; and 58° 1 on the 14th. These were all below their averages, with the exception of 8th and 9th, which were 5° 6, and 2° 6 above, by 3° 0, 5° 3, 5° 9, 0° 6, and 3° 9 respectively.

The mean temperature of the week was 60° 7, being 0° 3 higher than last week, and 1° 7 below the average of the week.

The highest reading of a thermometer with blackened bulb in vacuo placed in the full rays of the sun was 126° 0 on the 9th. The mean of the seven readings was 115° 4.

Rain fell on 4 days to the amount of 0.64 inch.

ENGLAND: Temperature.—During the week ending August 14, the highest temperatures were 76° 2 at Bradford, 75° 8 at Cambridge, and 75° 5 at Blackbeath; the highest at Newcastle was 67° 8, at Liverpool 67° 8, and at Bristol 68° 8. The general mean was 71° 8.

The lowest temperatures were 43° at Wolverhampton, 45° 3 at Cambridge, and 46° 5 at Blackbeath; the lowest at Preston was 52°, at Liverpool 50° 8, at Bradford, Leeds, and Newcastle 50°. The general mean was 48° 3.

The greatest ranges were at Cambridge 30° 5, at Blackbeath 29°, and at Wolverhampton 28°; the least ranges were 17° at Liverpool and Newcastle, 17° 5 at Preston. The general mean was 23° 5.

The mean of the seven high day temperatures was highest at Cambridge 70° 5, at Brighton 69° 7, and at Truro 68° 1; and lowest at Newcastle 63° 5, at Liverpool 65°, and at Sunderland 65° 2. The general mean was 66° 7.

The mean of the seven low night temperatures was highest at Blackbeath, 55° 4, at Truro 55° 3, and at Brighton 55° 2; and was lowest at Wolverhampton 49° 1, at Cambridge 52° 1, at Nottingham and Sunderland 52° 5. The general mean was 53° 3.

The mean daily range was greatest at Cambridge, 18° 4, at Wolverhampton 17° 2, and at Nottingham 14° 6; and was least at Newcastle 10° 2, at Bradford 11° 7, at Blackbeath and Liverpool, 11° 9. The general mean was 13° 4.

The mean temperature was highest at Blackbeath, 60° 9, at Brighton 60° 7, and at Truro 60° 0; and was lowest at Wolverhampton 56° 0, at Newcastle 56° 7, and at Sunderland 57° 2. The general mean was 58° 2.

Rain.—The largest rain fall was 1.93 inch at Nottingham, 1.55 inch at Bristol, 1.22 inch at Truro and Sheffield. The smallest fall was 0.17 inch at Sunderland, 0.35 inch at Newcastle, and 0.50 inch at Preston. The general mean fall was 0.83 inch.

SCOTLAND: Temperature.—During the week ending August 14, the highest temperature was 69° 0 at Perth, the highest at Greenock was 64° 0. The general mean was 66° 9.

The lowest temperature in the week was 41° 5 at Perth; at Leith the lowest was 47° 6. The general mean was 45° 4.

The mean temperature was highest at Paisley, 57° 6; and lowest at Aberdeen 55° 4. The general mean was 56° 5.

Rain.—The largest fall was 0.97 inch at Glasgow, and the smallest fall was 0.45 inch at Dundee. The general mean fall was 0.63 inch.

JAMES GLAISHER, F.R.S.

SUMMARY OF TEMPERATURE, RAINFALL, AND DURATION OF BRIGHT SUNSHINE in the United Kingdom, for agricultural and sanitary purposes, for the week ending Monday, August 16, 1886, issued by the Meteorological Office, 116, Victoria Street, London, S.W.:—The weather has again been cool, changeable, and showery, with heavy thunderstorms over England on the 13th.

The temperature has been uniformly low for the time of year, the deficit from the mean varying from 1° in "England, N.E.," "England, S.," and the Channel Islands, to 3° in "Scotland, N.," "England, E.," and "Ireland, N." Over Scotland and the greater part of Ireland the daily maxima have been continuously below 70°, but over England the thermometer on the 15th and 16th rose to 73° in "England, S.W.," 74° in "England, E.," and the Midland Counties, and 75° in "England, S." The lowest readings which were recorded on different dates in the various districts, ranged from 35° in "Scotland, N." (at Wick) to 45° in "England, S.," and 54° in the "Channel Islands."

The rainfall has been a little less than the mean in "Scotland, E.," and about equal to it in "England, S.," but more in all other districts, the highest being greatest in "Ireland, S."

Bright sunshine.—In Ireland and the southern parts of England bright sunshine has been far more prevalent than it was last week, but elsewhere the values have been lower. The percentages of the possible amount of duration have ranged from 21 in "Scotland, W." to 41 in "England, E.," 43 in "England, S.," and 55 in the "Channel Islands."

Depressions observed.—During this period the highest pressures have been usually found over Spain and France, while three depressions of importance have appeared on our coasts. The first of these was formed over the English Channel on the night of the 9th, and occasioned a good deal of rain over our south-eastern counties. During the ensuing forty-eight hours the system gradually became deeper, and travelled first in a north-easterly direction to Denmark, and finally in a north-north-westerly direction across Norway to the Atlantic. The second disturbance—one of diminishing intensity—advanced slowly to our west coasts on the 12th, and subsequently moved outwards across Ireland and England to the North Sea and the Baltic, where it apparently dispersed. As the system appeared fresh southerly gales and heavy rain were felt on many parts of our western coasts, while its progress across England was attended by thunderstorms. The third depression appeared to the north-westward of our islands on the 15th, and subsequently moved eastward across the north of Scotland. On our western coasts strong winds or gales from south, veering to west and north-west, were experienced, but in the east conditions were not materially affected.

OUR TELEGRAPHIC ADDRESS.—Our correspondents are requested to bear in mind that our Registered Telegraphic Address is "GARDENERS' CHRONICLE, LONDON. Telegrams (but not letters) thus addressed will reach the Editor or the Publisher without other address being needed.

AUSTRALIAN SEEDS: W. D. Watlie is the name given by the Australian colonists to various species of Acacia, mostly large trees there. Blackwood of Australia is Acacia melanoxylon. It is the native name of Dracena australis. Dogwood of New South Wales is Jacksonia scoparia; and the Victorian, or Tasmanian, is Beldfordia salicina. The Muskwood of New South Wales and Tasmania is Eurybia aciphylla. The seeds should be sown now, and placed in a greenhouse, and the pots be covered with a piece of slate. They will be long in vegetating; some will appear next spring, and others may keep dormant for a year or two. Do not hurry them in heat.

THE TROPICAL AGRICULTURIST, A MONTHLY RECORD OF INFORMATION FOR PLANTERS

OF THE CAROLINA, CUBA, INDIA, JAMAICA, SINGAPORE, MALAYA, CEYLON, CANTON, KOLA, COCA, CINNABAR, NATIVES, FISHES, PLANTS, and other Products suited for Cultivation in the Tropics. Published at Observer's Office, Colombo, Ceylon, on or about the 1st of each Month. Commenced in June, 1881.

The "TROPICAL AGRICULTURIST" has now an assured position in its large circulation in Ceylon, Southern and even Central and Northern India, the Straits Settlements, Sumatra, Java, Borneo, Northern Australia, Queensland, Central America, Natal, Mauritius, and the West Indies. From all sub-tropical planting settlements we have had cordial approval of the publication and an encouraging measure of support. The Editors, India, and Colonial Press, have spoken in commendatory terms of the T. A., as also Directors of Public Gardens under Sir Joseph Hooker, F.R.S., downwards, and so have all Planters.

No Planter should be without it

Rates of Subscription, including Postage, in Advance: £1 sterling, Rupees 12, Dollars 5.

Single Copies, 2s., or 1s. 6d. Back Copies, 3s., or 1s. 6d. Any one of the Four Volumes completed (1882-3, 1883-4, 1884-5, bound in cloth, lettered, with Comprehensive Index, for £1 10s (or 18s, carriage prepaid.

THE TROPICAL AGRICULTURIST.

As a medium for English, American, and Australian ADVERTISEMENTS of goods suitable for the tropics, India as well as Australia and American Agriculturists, from a variety of Industries (Central America being included in that territory) connected with agriculture, the Tropical Agriculturist stands unrivalled, the work being conducted in the hands of Native as well as European and American Agriculturists. From a Monthly Periodical the Tropical Agriculturist has on the table and is very often referred to during each month, a fact which Advertisers will know how to appreciate. Mr. W. T. LUBBERTON DRY, F.L.S., C.M.G., Director of Kew Gardens, writing of the T. A., refers to it as "an astonishing repository of everything relating to the Economic Fauna of the East."

It is used in Liverpool, Tea, Sugar, Fibres, &c. Agriculture, to better Advertising Medium exists.

Rates for Advertisements:—

[Nine Lines in a Line.] Twelve Lines and under, per Line, .. 9d. (8 annas) About Twelve Lines 8d. WANTED, a JUNIOR COUNTER HAND, at 2s. 6d. per week.—Apply, 12, King Street, Covent Garden, W.C.

WANT PLACES.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important that Remittings by Postal Order should be filled in payable at No. 47, ST. DRURY LANE, to W. H. GARDNER, as, unless the Number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE ORDER.

Letters addressed "Poste Restante" to initials or to fictitious names are not forwarded, but are at once returned to the writers.

NOTICE TO ADVERTISERS.—In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all.

Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisement which they wish repeated.

RICHARD SMITH and CO. beg to announce that they are constantly receiving applications from Gardeners, seeking situations, and that they will be able to supply any Lady or Gentleman with testimonials, &c.—10, Abchurch Lane, Worcester.

TO LANDED PROPRIETORS, &c.—A. McINTYRE (late of Victoria Park) is now at liberty to undertake Formation and Planting of New Parks and Grounds, and Remodelling existing Gardens. Plans prepared. 115, Lattin Park, Stamford Hill, N.

SCOTCH GARDENERS.—JOHN DOWIE, Seedsmen, 144, Princes Street, Edinburgh, has at present on his list a number of SCOTCH GARDENERS, waiting re-engagements. He will be pleased to supply full particulars to any Lady, Nobleman, or Gentleman requiring a trustworthy and competent Gardener.

B. S. WILLIAMS begs to intimate that he has at present in the Nursery and upon his Register some excellent Men, competent either to fill the situation of HEAD GARDENER, BAILIFF, FOREMAN, or JOURNEYMAN. Ladies and Gentlemen requiring any of the above will please send full particulars, when the best selections for the different capacities will be made.—Holloway, N.

THOMAS KENNEDY and CO. have on their Register a number of first-class GARDENERS, FORESTERS, &c., wishing engagement, and will be glad to furnish particulars to any one in want of same.—THOMAS KENNEDY and CO., 105, High Street, Dumfries, N.E.

GARDENER (HEAD), where more are kept. First-class, excellent character, active and industrious.—A. B. CHAMBERLAIN, Baker, Twickenham.

SEED and FLORIST'S ASSISTANT.—A young Man, age 19, wishes a situation; over five years' experience. Good Maker of Wreaths, Crosses, &c. Will be well recommended.—W. GALLOWAY, Arthur Dickson & Sons, Seedsmen and Florists, Bell-st.

HOLLOWAY'S OINTMENT and PILLS.—Diseases and casualties incident to young persons may be safely treated by the use of these excellent Medicaments according to the printed directions folded round each pot and box. Nor is this Ointment alone applicable to external ailments; conformity with the Pills it cures the most salutary influence in checking subtile diseases situated in the interior of the body; when rubbed upon the back and chest it gives the most sensible relief in Asthma, Bronchitis, Pleurisy, Gout, and Scrophulous Consumption. Holloway's remedies are especially serviceable in Liver and Stomach Complaints. For the Cure of Bad Legs, all sorts of Wounds, Sores, Scrophulous Ulcers, and Scrophulous Affections, this Ointment produces a cooling and soothing effect, inexpressibly grateful to the feelings.

Palace Gardens, Armagh. IMPORTANT SALE by PUBLIC AUCTION OF CHOICE STOVE and GREENHOUSE PLANTS, LAWN MOVER, &c.

MR. M. A. BELL has been favoured with instructions from G. D. Beresford, Esq., to sell by PUBLIC AUCTION, at the Palace Gardens, Armagh, on MONDAY, September 6, at 12 o'clock noon, an immense collection of choice STOVE and GREENHOUSE PLANTS, including—Azaleas, Dracenas and Crotons in variety, Hibiscus, Amaryllis, Gloxinias, Begonias, Hoyas, Geraniums, Centaureas, Coleus, Scabellodendron, ciliatum, Geraniums, Bouvardias, Camellias, Citrus, Double White Primulas, Cinerarias, Orchids, Ferns in variety, Palms, good Specimens Tree Ferns, and other Plants in numerous to mention.

Entrance by Dobbin Street Gate. Terms—Cash, and purchaser to pay Auctioneer's charges. M. A. BELL, Auctioneer, Armagh.—August, 1886.

To Nurserymen, Gardeners, &c. TO BE DISPOSED OF, owing to death of Proprietor, a good and increasing BUSINESS, consisting of Lease of Premises, Glasshouse, Stock and Plant, with good private connection.—MR. E. DAVY, 11, Connaught Road, Hove, Brighton.

Little Postbrook, South Hants 2½ miles from Carham Railway Station. TO MARKET GARDENERS, FLORISTS, FRUIT GROWERS, and OTHERS.

TO LET, with immediate possession, solely in consequence of the death of the proprietor, 20 VINERIES, GREENHOUSES, ORCHARD, CUCUMBER, and TOMATO HOUSES, covering about 1½ acre. The Houses are heated by 3 Boilers, and work on the most economical principle. The Vineyard is situated on 14 acres of LAND, of the finest quality, partly planted with Orchard Trees, now in full bearing. There is a good Manager's House, and a Cottage, with a few other houses situated on the best in England for the growth of Fruit, Roses, Cut Flowers, or for Market Garden purposes. The whole of the plant and soil may be taken by will, or by purchase. Further particulars may be had of C. B. SMITH and GOLDSMITH, Farnham and Portsea, Hants.

TO NURSERYMEN, Fruit Growers, &c.
FOR SALE, situate in the Parliamentary Borough of Bristol, a large and well appointed BUSINESS PREMISES, well stocked and in full working order, comprising nearly 20 Acres of Freehold Land, tillers free and well taxed, provided with all Appurtenances, which include large and valuable beds of Pennant Stone with Coal underlying. The House, built six years ago, is large and convenient; on ground fronting the entrance, half of size 200 by 27 feet by 16 feet, dining room, 18 feet by 16 feet, breakfast-room, two kitchens, larder, china pantry, and office; on first floor, five bedrooms and large parlour, 24 feet by 16 feet, and library. In the rear, a range of Glasshouses are two ornamental Ferneries, opening from drawing-room, large Camellia-house, two Vineries, each 55 feet by 12 feet, a Rose-house, 100 feet long, 12 feet wide, 12 feet by 11 feet; Cucumber-house, 64 feet by 14 feet; range of three Forcing-houses, 120 feet long; Stove, Propagating-house, Potato-house, range of Pots, &c., with several hundred hand-glasses. The whole is heated by a large boiler, and from 3000 to 4000 feet of hot-water pipes.

The other buildings consist of two nearly new Cottages, stabling for three horses, potting sheds, Mushroom-house, 64 feet by 15 feet; range of lofts used as fruit-rooms, &c., about 185 feet long; sheds, &c. The Working Sticks is too large and varied to put in an advertisement, and includes many thousand Standard, Pyramidal, and Bush Fruit Trees; of Pears alone there are over 1000 standard and pyramidal trees of the choicest and best varieties; also large numbers of Cherry, Apple, and Plum trees of the best cropping sorts.

The greater part of the fruit trees have been planted nearly twenty years, and are in full bearing, and the crop of fruit is very heavy and valuable.

Photographs of the fruit trees, with fuller particulars, or to view, apply to **GEO. HARDING**, The Grove, Fishponds, Bristol.

To Gentlemen, Nurserymen, Farmers Builders, AND OTHERS.
TO BE SOLD (in consequence of the owner retiring from business) by auction, at 10 o'clock, on Monday, the 10th of September, 1886, the **HOLLY NURSERIES**, Bold, near Warrington, established almost a century; comprising a handsome newly-erected Brick and Stone built Double fronted Dwelling house, with three entrances, Hall, staircase, four Bed-rooms, large Kitchen and Scullery with Nursery over, four Cellars and Out-offices, standing on an elevated site with tastefully laid out Walks and Ornamental Grounds and Shrubberies.

The **NURSERY LAND**, containing 20 acres, is well stocked with thousands of choice Flowering Shrubs and Evergreens, including Gold, Silver, Hodgkins', and other fine Hollies, from 1 to 14 feet high; Forest, Fruit, and Ornamental Trees, Roses, Thorns, Privet, &c. There are three strong Green-houses, Propagating houses, and a large Nursery.

The **FARMSTEAD** consists of above 18 acres of rich arable land, with or without the growing crops thereon, together with a detached Dwelling-house, with two sitting and five Bed-rooms, with Ornamental and Kitchen Gardens of extensive but buildings, Shippens, Stabling, newly erected Cart-shed of large size, and other Offices; also six well tenanted Cottages with the appurtenances thereon.

The whole comprises about 40 a. 2 r. 3 p. of well drained **FRESH FOLD LAND**, in full heart, in a ring fence, with frontages at least half a mile, to the two main roads from Liverpool St. Heales, and Warrington. Situate one mile from the Farnworth and the Clock-face Stations on the London and North-Western Railway, and 4 1/2 miles from Warrington; it is well situated for a Public Pleasure Garden.

A view and all particulars may be had from the proprietor, Mr. JOHN STEAD, of the Premises, also from Messrs. ROBERT DAVIES, SHARPE & CO., RAILWAY Solicitors, Warrington; or from Messrs. ARTINGSTALL and HIND, Auctioneers, Manchester.

To Landed Proprietors, &c.
A. MCINTYRE (late of Vicar Park) is now at liberty to undertake the **FORMATION and PLANTING of NEW GARDEN and PARK GROUNDS and REMODELING existing GARDENS.** Plans prepared. 715, Listera Place, Stamford Hill, N.

LILIES OF THE VALLEY.
FORCING CROWNS, &c., 3-yr. old strong flowering Crowns, of my well-known large flowering variety. Prices per 1000, 10/00, and 20/00 on application.

PLANTING CROWNS, 1-yr. young. Plants for growing on for forcing, the true large flowering variety, acclimatised, and which will be fit for forcing two years after planting. I have long since proved that Lilies of the Valley can be successfully grown in England, and in many cases excel those from Germany. I recommend every one who requires crowns for forcing to grow them himself. A Pamphlet, "How to Grow Lilies of the Valley Successfully," will be sent free with every order amounting to 10s. and upwards. Delivery from November to April. First 100 per 1000, including package. Cash only. No order without remittance will be acknowledged.

T. JANNOCH, Lily of the Valley Nursery, Dersingham, King's Lynn, Norfolk.

T. BALDWIN and SON, Edith Nursery, Burchall Road, Leyton.

Come and See

IT IS NOW ADMITTED, not only by thousands in the United Kingdom who make their annual visit, but by hundreds of foreign customers and friends, that the "**HOME OF FLOWERS**" affords much the most glowing and interesting floral sight in the world. It should be distinctly understood that we write our own announcements, and do not pay others to trumpet forth our productions, neither are tickets necessary to see and verify our statements. It must also be known that we do not put imaginary constructions and value on the perfectness of our collection. We have all the choicest and best varieties collected from all sources, irrespective of cost, for comparison, consequently we have the very best evidence and material for knowing and obtaining valuable improvements.

Just at this moment our **BEGONIAS, GLOXINIAS, ZONAL PELARGONIUMS, VERENAS, DAHLIAS, EARLY FLOWERING CHRYSANTHEMUMS,** and other various families are in the zenith of their perfection, and excel anything ever before seen in this country. Again, without seeing it one would scarcely believe that we have a **DOUBLE VERENA** (Defiance II.), or credit that mortal hands could produce a plant perfectly intermediate between a very tall and a very dwarf variety, with percentage equally proportionate; but here it is, and what is supposed to be the greatest stride, surprise, and victory ever achieved in cross-breeding.

We are proud to receive all lovers of flowers, and many on the termination of their inspection say, "The intensity of colour is too much and too dazzling for the eye;" others remark, "Your flowers are wonderful, and I must certainly repeat the visit."

All who have not perused our CATALOGUE are specially requested to send us their address.

H. CANNELL & SONS,
 The Home of Flowers,
SWANLEY, KENT.

WM. G. MAC GREGOR,
 17, Fenchurch Street, E.C.

The *Daily Telegraph* of August 20, 1886, in a Leading Article, states:—"Tomato growers in the Channel Islands seem in a fair way of making fortunes. There is no doubt the time is near when the market will be as well supplied with Tomatos all the year round as Cucumbers."

THE GUERNSEY AND JERSEY FRUIT AND PRODUCE COMPANY, LIMITED.

Registered under the Joint Stock Companies' Acts, 1862 to 1883, whereby the liability of the Shareholders is limited to the amount of their Shares.

CAPITAL £20,000, IN 4,000 SHARES OF £5 EACH.

First Issue of £15,000 (3,000 Shares) without premium, a number of which have been already taken up privately. Payable £2 10s. on Allotment, and it is not intended at present to call up more than £2 10s. per Share.

LONDON BANKERS—CAPITAL and COUNTIES BANK, Head Office and Jersey.
GUERNSEY BANKERS—COMMERCIAL BANKING COMPANY, High Street.
LONDON OFFICE—4, Tokenhouse Buildings, Bank of England. GUERNSEY OFFICE—Glasshouses and Vineries, Courtil de Jacques.
MANAGER—HENRY DE JERSEY. SECRETARY—EDWARD OXENFORD PRESTON.

THE GUERNSEY AND JERSEY FRUIT AND PRODUCE COMPANY (LIMITED) has been established for the purpose of Growing Fruit and the Produce generally of the Channel Islands, and also for Receiving such Produce from Growers and Supplying the same direct to Consumers and Retail Establishments. The Trade has hitherto been almost entirely in the hands of private growers, except two local companies which have paid their shareholders from 12 to 20 per cent. dividends, and is well known to be of a most profitable character.

The Directors with confidence recommend the operations of this Company, for which there is a fine opening, as an unusually safe and remunerative investment—safe, because nearly the whole of the Company's capital is being invested in first-class land in Guernsey, and Glasshouses for the Culture of Grapes, Melons, Tomatoes, Beans, and other Choice Fruits, which are supplied from the Channel Islands, into England.

The property of the Company will increase in value with the growth of the Vines.

As showing the Profits derived from dealing in Fruit and Garden Produce of the Channel Islands, the Directors are informed one of the two Companies in Guernsey has paid its Shareholders dividends at the following rates:—

1885, 10 p. cent.	} Extensive building operations took place during these years.
1886, 11 "	
1887, 9½ "	
1888, 15 "	

The only other Vinery Company which commenced operations recently has paid its Shareholders 12 per cent.

Applications for Shares, stating number required, can be made to the Secretary of the Guernsey and Jersey Fruit and Produce Company, 4, Tokenhouse Buildings, Bank of England, London, E.C.; or to the Company's Bankers. Prospectuses and any information desired will be supplied on application.

Upon a fair estimate, the Directors anticipate a dividend of at least 10 to 12 per cent. on the year's sales.

The Sales of Tomatos from one house only, for the week ending August 7, amounted to a quarter of a ton. The Directors have erected on the Company's Estate, to secure the coming winter crops, which prove very remunerative, the following:—

One 200 feet House.	Six 200 feet Houses.	One 180 feet House.
Two ditto.	Seven ditto.	Two ditto.
Three ditto.	Eight ditto.	Three ditto.
Four ditto.	Nine ditto.	Four ditto.
Five ditto.	Ten ditto.	Large Vinery, 45 feet wide.

Total, fourteen long Span Glasshouses and large Vinery, making a total of about 50,000 square feet of Glass.

The *Horticultural Times*, June 20, refers to the Company as follows:—

"The development of Market Gardening in the Channel Islands has often been dealt with by us, and we are glad to learn that efforts are being made to still further prove what, under high culture, the land will produce. The Guernsey and Jersey Fruit and Produce Company is a striking example of this. Incorporated only last February—when its estate did not contain a single glasshouse—it has now 50,000 square feet of glass erected! Having as local manager one of the most successful growers in Guernsey, with economical management, half the capital only called up, and nearly the whole of capital invested in freehold land and houses, and of progressing value, this venture will, we predict, succeed. It has started in the right spot, under the right management, and is raising the right sort of produce. As we write, we have specimens of the Company's first Tomato consignment before us—grown without heat—and we can vouch for their excellent quality. Colour and size are almost perfect."

 FOR THE
 ROYAL PARKS, AND BY THE METROPOLITAN BOARD OF WORKS FOR THEIR LONDON PARKS.

Begs to announce that he has received his Annual Importation of

DUTCH and FRENCH BULBS,
 Which are unusually large and well ripened this year.

EARLY ORDERS SOLICITED.

The Illustrated Bulb Catalogue
 Has been Posted to all Customers. A Copy of same will be forwarded to any who may not have received one.

VICTORIA and PARADISE NURSERIES,
 UPPER HOLLOWAY, LONDON, N.

PRIZE COB and other NUT TREES.
 Gentlemen desirous of obtaining the true
WEBB'S PRIZE COB FILBERT TREES,
 AS ALSO THE
 Kentish Cob and other Nut Trees,
 should send their Orders as early as convenient to
Mr. COOPER, FRHS. Calcot Gardens, Reading,
 of whom alone the various sorts can be obtained.
PRICE LISTS and PAMPHLETS on application.

BERLIN LILY of the VALLEY CROWNS,
 STRONG BLOOMING,
 OFFERED BY
JOSEPH KLAR,
 199, LINIENSTRASSE, BERLIN.

FERNS A SPECIALTY.
 AN IMMENSE STOCK, in SPLENDID CONDITION.
 ILLUSTRATED CATALOGUE, containing "Hints on Fern Cultivation," 1s.

SMALLER CATALOGUE, of over 1300 species and varieties, including Descriptive "LIST of NEW, RARE, and CHOICE FERNS," and "HARDY NORTH AMERICAN FERNS," free on application.

W. & J. BIRKENHEAD,
 FERN NURSERY, SALE, MANCHESTER.

DENBIES.
 IN Manning and Bray's *History of Surrey*, 1804, Denbys or Denbighs is described as having been an ordinary farmhouse, which was purchased, in 1734, by Mr. Jonathan Tyers, the proprietor of Vauxhall Gardens, who improved the place and laid out the grounds. It pleased Mr. Tyers to contrast the gaiety of his public gardens by the exhibition of an entirely different taste at Dorking, and accordingly he planted a wood of 8 acres, and named it *Il Penseroso*, and in its midst he placed a small temple abounding with serious inscriptions upon the walls, while a clock, concealed from view, rang out a solemn knell at the end of every minute for the purpose of reminding all who heard it of the passage of Time.

Numerous retired walks, adapted for reflection, intersected the wood, and not far from the temple was a building open at the sides, so as to exhibit a statue of Truth pointing to a couple of recumbent figures. And here this very realistic artist reached a climax, for the two figures, large as life, represented a Christian and an unbeliever in their last moments.

When Mr. Joseph Sedley, in *Unity Fair*, became inebriated at Vauxhall Gardens, and addressed one of the young ladies of the party suddenly as "Diddle, diddle, darling!" every body took flight and went home, and so at last did the owner of the gardens, Mr. Tyers, who departed this life in 1767, when Denbies was sold to the family of which Lord King was the head, and the grave conceits of Mr. Tyer were done away with. After passing to another owner Denbies was secured in 1787 by the distinguished merchant and banker of London, Mr. Denison, M.P., whose nephew, Lord Londesborough, sold it to Mr. T. Cubitt, the builder of Osborne House, and afterwards of the great house here, which stands conspicuously on a bold chalk promontory of the valley of the Mole, and which is now occupied by his esteemed successor and son, the Right Honourable George Cubitt, Member of Parliament for the Epsom division of Surrey.

It is difficult to describe the scenery which lies spread around this commanding site. Olympus would not have been too grand a name for a hill and house which Jove himself might covet. I have seen a learned German book whose first chapter commences in this way—"Think a wall;" and it then describes a wall. Suppose we think a hill reared many hundred feet above the town of Dorking, and commanding a landscape reaching from the South Downs of Sussex across the Wealden, and over Leith Hill, and northwards into Bucks and Berks, and across Surrey and Middlesex as far as such salient landmarks as the dome of St. Paul's, the towers of Westminster, the Crystal Palace, the Grand Stand at Epsom, the Holloway Institution at Egham, and Windsor Castle. This is Denbies! and on such a site, so high and so exposed to blustering winds coming from the open north, and from Leith

Hill and over that hill by Dorking known as The Glory, you would hardly conceive it possible what snug lawns surround the house, and what fine specimens of tender Conifers and other things adorn them. The memory of benefits passes away, but I suppose the wood which shelters Denbies on the south-west, and encloses the long lawn extending from the terrace under the windows to Ranmore Church, was planted by Mr. Tyers. It is chiefly of Beech, edged with evergreens on the lawn side to break the wind, since Beech woods are often hollow below. A long avenue of Beech passes through the wood—an interesting object, but without the arch which the Lime forms by the interlacing of its branches.

There are specimens on the lawn which could not exist on the bare unplanted chalk hills of Sussex and Surrey, and they are all due to Tyers' Wood, which flanks them on the windy side. I noted among them the following trees, all from 40 feet to 50 feet in height, and all very handsome specimens:—*Cryptomeria japonica*, *Abies cephalonica*, *A. Pinsapo*, *Taxodium sempervirens*, and *Pinus insignis*. There are four of the last-named tender Conifers in one group on the north side of the lawn, near the beautiful and far seen spire of Ranmore Church, and the two outside trees have given their protection to the two inner ones, which are fair and shapely while their nurses have been sadly battered and embrowned by the weather. In exposed situations the protection of trees alone enables other trees to prosper, and many lofty knolls owe their charms chiefly to their planters. The big house at Denbies, for I suppose the name applies to the spot, though the noble mansion is part and parcel of the place, was completed about the year 1852, and much subsequent clothing of the hill with trees and plantations has completed the conversion of what was once a bare down into an exceedingly picturesque park with well sheltered, winding approach roads.

A few great trees are always an ornament around a house, and, thanks to Mr. Tyers or Mr. Denison, several noble Cedars of Lebanon and some great Beeches challenge admiration in the park close to the dwelling. The garden on two sides of the house, looking south and east, is a narrow strip, which must be appropriate in a case where further decoration might seem to desecrate a park whose natural features are hardly capable of improvement.

The ornaments of the lawn cannot all be noticed here. I must forbear to name the different sorts of Rhododendrons, or to describe the fernery, or the herbaceous plants, or the covering of some of the walls, including the house; but I must mention the long stretch of beds in a single row, gorgeous with bedding plants, seen from the conservatory in a long line of purple, white, and gold, and from some of the windows of the drawing-room. The width of the strip of turf which connects the terrace with the lawn lying between the wood and Ranmore Church is not great. It forms, in fact, a wide green passage, with a single line of beds running down the centre. Mr. Beesley, who kindly showed me round the gardens, has arranged the colours of these beds with great taste, and has thus provided in the long line of colour edged with green quite a novel spectacle. The effect, too, is increased by a large bed of *Hydrangea paniculata*, which lies like snow on the turf at the end of the vista.

The forcing and other houses are extensive, consisting of many divisions for Grapes, other fruits, and flowers, and including a long walk through wide corridors planted with flowers, with intersecting houses and vestibules. You may stroll through these corridors and away through Graperies into wide "passages," as they are called here, full of fruit trees, including a wonderful crop of Plums. I have heard of the *Lagereria* out-of-doors—L. rosea

grows here at one end of a passage barely frost-proof, and its quarters must suit it, for the number of its gorgeous blossoms is, as Dominic Sampson would have said, "Prodigious!" A single plant of *L. alba* in a more dignified position among congenial companions, hangs its white and waxen flowers from the roof of a corridor, the number of its blossoms this year being countless—at any rate I made a vain attempt to count them, and broke down at fifty. One or two were double.

The lofty conservatory, entered from the house, and communicating with the corridors, contains many plants of much interest, and some "good old-fashioned sorts." *Tacsonia exoniensis*, a product of cross-breeding (see *Gardeners' Chronicle*, 1872, p. 1653) a South American climber, hangs its carmine blossoms from the roof, looking like what it is—a near relation to the most gorgeous of the *Passiflora* family. *Tacsonia mollissima* is here, too, with pink blossoms, and two sorts of beautiful *Bignonia*s—*B. Chirere*, with scarlet and orange flowers, not unlike *Gloxinias*, hanging aloft, and as large, with *B. grandiflora*. As the wide and handsome corridors are, in fact, conservatories, one need not be particular as to the division in which the few flowers that can be noticed here may happen to grow.

The *Fuchsias*, ranged along one side of the conservatory proper, are very remarkable, and require a building of some height, since the plants are all old bushes 8 and 10 feet high, and if you lift the drooping top branches you will easily get a measurement of 14 feet. All the bushes are loaded with blossoms, and the floral display is so attractive and long-continued that the names of the sorts may be desired. They are *F. Dominicana*, named after its raiser; *F. Souvenir de Chiswick*, *F. Venus de Medicis*, *F. corymbiflora*, which is not a hybrid, but an import from Peru, and looks subtropical out-of-doors through the summer; *F. triumphans* and *F. Rose of Castille*.

A bank of *Begonias* along the front wall of a corridor is something to linger over, especially when composed of the new sorts, which some one has called "tremendous," and when the annual *Lobelia ramosa* runs along in front with light blue flowers and delicate foliage, a plant never out of place in the front row of the conservatory, where its weeping habit of growth effectually breaks the straight lines of such a position. Among other plants I noted the yellow and scarlet *Brugmansia sanguinea* and others, *Abutilon megapotamicum*, the rosy-flowered *Canna Ehemanni*, which should be planted in every great conservatory for its beautiful flower and leaves, and moved with the sub-tropical garden outdoors in summer. Here I must stop, leaving a number of fine old sorts still unnamed, including all those in the stove. My paper being already long, perhaps I may here slightly alter Sterne in one of his most pathetic stories—"Shall I name them? No." *H. E.*

New Garden Plants.

BULBOPHYLLUM SAUROCEPHALUM, n. sp.*

AMIDST all the *petites horreurs* which the protean Orchids afford this one ranks with uncommon dignity. It combines, as some *Bulbophyllarias* do, the common habit of a *Bulbophyllum* with a curious clavate thick bright red rhachis of the inflorescence, and this is loaded with flowers which make you think of the heads of alligators and similar amphi-

* *Bulbophyllum saurocephalum*, n. sp.—Pseudobutis tetragono-pentagono conico fusiformibus monophyllis; folio streuo cuneato oblongo acuto; pedunculo in rhachin inflorescentie crasso-cylindrico incrassato albidifloro; bracteis triangulis ovatis puberulis transverse-ovariis subquadrangulis; ovario pubescenti; sepalis impari paribus; sepalis paribus connatis;

bious quadrupeds. The sepalis are light ochre, coloured with brown lines over the chief nerves. The petals are small, white, with reddish midline and borders, lip's base deep purple, blade ochre. Column white, with some purple lines and light ochre wings.

This great curiosity was kindly sent me by my excellent correspondent, Mr. W. Lee, of Downside, Leatherhead, who tells me it comes from the Philippine Islands. *H. G. Rehb. f.*

EPIDENDRUM FRISTES, n. sp.*

A slender plant, with the habit of *Epidendrum ellipticum*, but with larger and very bright flowers. The pedicels are white at the base, cinnabar at the top, sepals lanceolate, petals equal, but serrate on the superior half, all cinnabar by; lip trifid, as described in diagnosis, finest yellow with a few cinnabar spots; column clavate, with the borders of the involutal side lacinia, serrate, deepest purple-cinnabar with a green anther.

This fine plant appeared with Mr. W. Lee, who kindly sent twice very good, very fresh inflorescences, and even a plant with roots.

Many of my correspondents may read with surprise, that Mr. W. Lee takes not only care for the best packing, for the freshest flowers, for excellent specimens, and that this gentleman adopts also the excellent custom of having his full name and address written inside of the strong box. It is very uncomfortable to get sendings from unknown senders, and what misunderstandings arise from anonymous packets. And how often do I linger for news, which might have saved me hours. Thus I had a fortnight ago from Frankfort-on-Maine, in Germany, a box with a French address, French remarks to the flowers, but without any name of the sender. It contained very interesting monsters of *Cyrtopodium Lawrenceanum*, *Otontoglossum crispum*, and typical flowers of *Aerides pallidum*, Blume, with the remark that it was called *Thibautianum* in France. *H. G. Rehb. f.*

CELOGYNE FOERSTERMANNI, n. sp.†

This is a gorgeous plant, whose morphological habits would appear to be those of a *Ute carriei*, that goes on its own way. The strong rhizome, as thick as a mighty condor's quill, is covered with numerous finally sepia-brown sheaths, and copious roots creep downwards. The old bulbs show the scars of two leaves and traces of an ascending inflorescence. Now one, now two peduncles arise on one or other side of the leafy bulb. And what peduncles are they!—one, 2 feet high, covered with dense sheaths—the flower-bearing part flexuose, with scarios linear acute bracts as long as the stalked ovaries. I have them before me with twenty flowers and their scars. Mr. T. F. Foerstermann tells me he found them with forty flowers! I see in this inflorescence a mimicry of that of *Miltonia flavescens*. And now comes the strangest thing. The peduncle dies away and leaves its base, as it appears quite dead and without any fresh shoot. I have one specimen at hand, that has some sheaths both apart from the inflorescence and the basal sheaths. This would bring the plant into Dr. Lindley's *Proliferae*, though the other specimens denote the group *Erectae*, where it must be placed by the majority of character. I am informed by Mr. T. F. Foerstermann that the flowers are snow-white with some yellowish-brown on the lip's disc. The dried

multo majoribus; apice exilis omnibus extus velutinis tepalis triangulis acuminatis angustis serrulatis; labello basi utrinque angulato; lamina ligulata ovata; columna apice utrinque alata, ala bifida, lacinia superioris ascendente ligulata retusa, inferiori biflorae. Ex insulis Philippinis advectum dicitur. Acc. ab exc. W. Lee. *H. G. Rehb. f.*

* *Epidendrum fristes*, n. sp.—Amphiglotium scapitochila carinata; gracile, caule (foliis) inflorescentia prope; Epidendri elliptici, Grub.; foliis margine minutissime serrulatis; floribus majoribus; sepalis lanceatis; tepalis subaequalibus dimidio superior serratis; labello lacinia laterali subovatis inaequaliter serratis; basi involuta; lamina ligulata ovata; columna antica recto; lobis serratis, carina flexuosa a basi in discum, callo subrhombico utrinque; androclivis lacinia laterali involuta serratis. Coloris vivanque misit exc. W. Lee, Downside, Leatherhead. *H. G. Rehb. f.*

† *Celogyne foerstermanni*, n. sp.—(Erectae.) Rhizomate validissimo squamoso repente; pseudobulbis crasso cylindricis crullis pluricostatis diphyllis, foliis petiolatis oblongis nervosis rigidis prope sesquipedalibus; pedunculis juxta bulbos evoluto; validis longissimis a basi multi-quantis vagis diversis canibus quibusdam subulbis; ovario crasso, callo subrhombico flexuoso, bracteis duo persistentibus linearibus ovaria pedicellatis subaequalibus; sepalis tepalique ligulatis acutis; labello trifido, lacinia laterali subovatis inaequaliter mediani minori perirecta elliptica acuta minute crassa, carinis plicatis a basi pedicem inter lacinias laterales, lateribus in crura duo supra laciniam medianam anterae decurrentibus, carina mediana evanescente; columnam trigonam, androclivum limbo lobato. In Archip. Sondaico dexteri exc. T. F. Foerstermann. *H. G. Rehb. f.*

flowers are equal to the fresh ones of a very good large flowered *Coelegyne* Cumingi.

I have dedicated this lovely plant of Sondaic origin to its zealous discoverer, Mr. T. F. Foerstermann. I feel persuaded that this lovely inflorescence will constitute a fresh attraction to our Orchids. *H. G. Rehb. f.*

LÆLIA BATEMANIANA, n. hybr. (Hort. Veitch).

[A HYBRID BETWEEN A *CATLEYEA* AND A *SOPHRONITIS*.]

This is a glorious result of the Sedenian skill at the Royal Exotic Nurseries of Messrs. J. Veitch & Sons, being a seedling saved from *Sophrontis grandiflora* and *Catleya intermedia* five years ago—a lovely gem, a miniature *Lælia*, with the short peduncle of a *Sophrontis*; or you might compare it to such *Lælias* as *L. rufestris*, or a purple *L. albida*. Longest bulb $1\frac{1}{2}$ inch; one with one, another with two leaves; these are $1\frac{1}{2}$ inch long, $\frac{3}{4}$ inch broad. The one-leaved bulb has a short peduncled *Lælia* flower, as already stated, yet the petals are pretty rhombic, like those of *Sophrontis grandiflora*. The sepals are ligulate-acute, the lateral ones slightly recurved; and the petals are of a light purple rose-madder, with the very lightest mauve hue, which appears to get deeper as the flower gets older. Lip trifid; side lacinie long, cuneate-oblong, obtuse-angled; mid-lacinie oblong, blunt, obscurely yaw, of the warmest Dahlia carmine, with a light mauve hue. This is the *pièce de résistance* on which the gem's fine contrast relies. The side lacinie and disc are white with a light mauve-purple border. Columna trigonal, quite *Lælia*-shaped, with the small dorsal lobe overlapping the anther; white, with a few purple spots at the angles, four of which peep out like eyes, two each side the anther. Pollinia eight, exceedingly thin, one pair much smaller, nearly obsolete. I am very doubtful whether these pollinia will prove fertile.

This plant has been much admired by the connoisseurs, and I feel very pleased to have this graceful document at hand, with a fine sketch of the whole plant prepared by Mr. Page. This novelty offers a wide field for consideration of nomenclature.

Are all hybrids between what we call genera to get intermediate names, as that lovely name of *Philægoria* of Masters? What do you think of *Catsophia* or *Sophrontidicattleyidium*? I do not propose such names in this case, nor do I believe the cases numerous where they are desirable, as when the plant shows an absolute mixture of the characters of the two genera. We know many hybrids have the floral characters of the one, the foliar characters of the other parent. In such a case you may place them under the genus whose flowers it has.

Our case is much worse. The effect of mixing a *Sophrontis* and a *Catleya* is a *Lælia*!

Now indeed, if you look to recent publications, there is no character given for *Sophrontis*, and if you would like to do honour to "habit," there are three kinds of habit in the genus. The single character on which I could rely, is the expansion of the stigma (excluding *Sophrontis violacea*), but this is not much. Hence I must reduce *Sophrontis* as *Lælia cernua*, *pterocephalus*, *militaris*, *purpurea*, *grandiflora*, for those who accept changes, and leave alone *Sophrontis violacea* with a remodelled character.

This lovely gem, according to Mr. Harry Veitch's promise that a fine new hybrid should bear the name of our illustrious excellent veteran, Mr. James Bateman, is dedicated to him in due acknowledgement of his having finally made his peace with the hybrids at the London Orchid Conference (see *Gardeners' Chronicle*, 1885, n.s., xliii., May 16, p. 642). *H. G. Rehb. f.*

FRUIT CROPS NEAR TO THE SEA.

THE supposed vitalising and invigorating properties of the dry air of the east coast of England are now being recommended by medical men in preference to the more humid atmosphere of the western shores; and among other reputed health-restoring resorts adjacent to the North Sea, and in close proximity to noble rivers, viz., the Orwell and the Deben, is the fast-improving seaside town of Felixstowe, some 12 miles from Ipswich, and about 5 miles from the seaport of Harwich. It is situated upon a bold acclivity commanding extensive views of the sea, as well as portions of the shores of Essex and Suffolk. The principal line of houses is within a few yards of high-water mark, and the beach extends for some 5 miles without interruption, or from Landguard Point on the south to Bawdsey Ferry on the

north, while on the latter portion of it various fossils, together with amber and cornelian, are frequently found. The walks upon the cliffs are very pretty, and they command extensive views of the sea, and in the distance Walton-on-the-Naze and other objects of interest. But it was the fruit crops in the neighbourhood which attracted my attention, such as that of the Apple, the Pear, and the Plum, which in many localities are this season far from being abundant; but here, in most instances quite near to the sea, are all that could be desired. In a sort of hanging garden, very skillfully formed upon a portion of the cliffs about half-way between the Bath and the Ordnance Hotels, the Apple crop is particularly abundant. This garden extends to within a few yards of high-water mark. It is tastefully laid out in the form of terraces connected with each other by long flights of stone steps, while to the right and to the left are grottos and arbours partially concealed by Ivy and other climbing plants. The fruit trees consist of various varieties of Apples, Pears, Plums, Figs, and the varieties of bush fruit, such as the Gooseberry and the Currant. A lofty wall which intersects the garden from north to south is beautifully clothed with varieties of the Grape Vine. The rods are not trained close to the surface of the wall, but are secured to a framework of iron rods at a distance of some 18 inches from it; but although it presents a very pretty appearance, the aspect being nearly due east, unlike the other varieties of fruits in the garden the Grapes, as a rule, seldom ripen satisfactorily. The varieties of the Apple are mostly grown in the form of espaliers or cordons; the trees are all very healthy, and without an exception every tree bears a full and heavy crop of what has the appearance of becoming fine fruit. Pears and Plums are mostly in the form of standards, and all are growing and bearing freely. The garden appears to have existed for a considerable number of years, to judge by the appearance of the trees, &c. The soil consists chiefly of the crumbling surface of the cliff, but may have been enriched by the addition of surface-soil from other parts, and of better quality; but be that as it may, fruit trees appear to thrive admirably upon it.

The flower gardens attached to the "Bath Hotel" are justly celebrated for their beauty. They are this season very tastefully planted with the finest varieties of bedding plants. Even carpet-bedding is extensively practised, while, as an indication of the mildness of the climate, such tender species as the *Alternanthera amœna*, &c., had well covered the surface of the soil soon after the middle of the month of July. Standard Fig trees here are also bearing an abundant crop of fruit, and this they seldom or never fail to ripen. The pretty foliated *Tamarix* may also be seen in the form of standard trees of considerable dimensions.

A little further to the north is the pretty seaside residence of Felix Cobbold, Esq., until lately one of the members for the county of Suffolk; while on the high cliff, close to the sea, at Bawdsey Ferry, Mr. Quilter, M.P., is erecting a beautiful residence, which, when finished, will form a very remarkable feature in this rapidly improving locality. *P. G.*

SCOTCH NOTES.

THE VISIT OF THE QUEEN TO THE INTERNATIONAL EXHIBITION, EDINBURGH.

ON the 18th inst. the Queen paid a visit in state to the International Exhibition, Edinburgh. The Executive Committee and the exhibitors generally busied themselves energetically for some days previously in special efforts to make everything attractive, and to give Her Majesty a right royal reception; and they succeeded well. The Horticultural Committee distinguished themselves by the excellent taste they displayed in decorating the grand stand, the Queen's statue in the neighbourhood of the principal entrance to the grounds, the terrace in front of the grand hall, the grand hall itself, and all other parts of the buildings through which Her Majesty was to pass. The execution of these decorations was entrusted to Messrs. Thomas Methven & Sons. The materials used by them were chiefly Tree Ferns, Palms, and other fine-foliage plants, all of which were admirable specimens of their kind. The pedestal of the Queen's statue was ornamented with massive festoons of Oak leaves. The grand stand, an enormous erection, capable of seating over 3000 people, was rendered

gay with festoons of evergreens and floral crowns, the latter of great size, and formed with excellent taste.

The royal retiring-room at the east end of the Exhibition building was entered through a bank of Roses, and the interior of the room was decorated with masses of cut blooms of the same, supplied and set up by Mr. Hugh Dickson, of Belmont Nurseries, Belfast.

Immediately outside the royal retiring-room was situated the exhibit of Messrs. Lamont & Son, Edinburgh, the principal features of which were noticed in our general report of the horticultural exhibits in May. It was now richly adorned with trophies of single Dahlia blooms and *Lilium auratum*, which presented a gorgeous appearance, standing out in relief from the beautiful forms of Conifers and other shrubs which compose the bulk of the two groups. The letters "V.R." were picked out in device with violet and primrose *Viola* blooms on either side of the doorway leading into the Exhibition buildings at this point, and which divide the two groups of plants.

At this point Her Majesty entered her carriage and drove past the fine groups of Messrs. Cunningham, Fraser & Co., and Messrs. Ireland & Thomson. The former of these two groups has been recently wholly renewed, and comprises an interesting and beautiful assortment of choice and rare Conifers, and beautiful samples of *Ivies* trained in elegant style on moss-covered stumps all arranged in a most tasteful manner. Messrs. Ireland & Thomson's exhibit has also been considerably added to and greatly improved. Several noble Palms and Cycads introduced into some of the principal points gave for the occasion quite a tropical aspect to the groups, which was enhanced by the intermixture with the Conifers, *Ficus elastica*, Blue Gum trees, and Sweet Bays, which are ordinarily the chief components of the groups of well coloured plants of variegated *Zea*, *Palma Christi*, and masses of *Lilium lancifolium* rubrum. Messrs. Little & Ballantyne, Carlisle, added considerably to the interest of their fine group by the introduction of some very highly coloured golden *Yews*, *Retinosporus*, *Cupressus*, and other coloured Conifers, and golden *Hollies*.

Messrs. Cocker & Sons, Aberdeen, had an extensive display of Roses in Messrs. Keith & Co.'s conservatory, which were greatly admired by the thousands of visitors who crowded the Exhibition grounds. The collection, numbering many hundreds of blooms, comprised grand samples of *Merveille de Lyon*, A. K. Williams, and other favourite H.P. Roses, and a rich assortment of Tea Roses, embracing many varieties, showing that even the more delicate sorts of this favourite class may be successfully cultivated so far north as the Granite City.

On the 19th the Queen again visited the Exhibition for the purpose of making a private inspection of the many points of interest that could not be reached in the limited time that could be devoted to them during the ceremonial visit of the previous day.

It had been arranged that Her Majesty should plant a memorial tree before leaving the grounds on the occasion of her second visit to the Exhibition, but the weather proving unfavourable she delegated the task to the Marquis of Lothian, while she witnessed the operation from her carriage. It was planted about 20 yards nearer the entrance to the grand hall than the one that was planted by Prince Albert Victor when he opened the Exhibition in May. The tree, a *Wych Elm*, was presented by Messrs. J. Methven & Sons, and had been prepared by them in anticipation in the spring.

MESSRS. LAMONT & SON'S NURSERY, MUSSELLBURGH.

This nursery is pleasantly situated about 5 miles eastward from Edinburgh, Joppa being the nearest station, access to which may be obtained by over the twenty trains daily from the Waverley terminus of the North British Railway. Much of the nursery ground lies in an extensive and beautiful glen, formerly the site of a considerable coal mine, long since disused. The glen stretches east and west, and a pretty burn or little stream meanders along its bottom. The sunny slopes of the northern side are planted with Strawberries and Potatoes, both of which are grown largely in an experimental way. The cool aspect of the southern side is entirely devoted to Raspberry culture, of which there are a good many acres, the varieties being chiefly Fastoll and Northumberland Fillbasket. The former is held in highest esteem as a profitable market variety. It gives an enormous crop in a perpetual sort of way during a longer period

than any other sort known; there is no flush at any time, and consequently no glutting of the market, while it continues to bear long after most other kinds are a finished crop. The bottom of the glen is devoted to the culture of Dahlias, Carnations, and other florists' flowers, choice herbaceous perennials, and alpine plants. The upper fields lying north of the glen, and fully exposed to breezes from the Firth of Forth, are stocked with hardy forest trees and choice Conifers, and deciduous ornamental trees and shrubs. There is no attempt at getting up shelter; the stock must protect itself. It is marvellous how well many things do here which in many parts of the country, much more warm and sheltered, prove very disappointing in regard to their hardiness. *Abies (Picea) amabilis* (true), *A. grandis*, *A. concolor*, *A. lasiocarpa*, all the *Retinosporas*, and the numerous other ornamental Conifers, not only grow well but assume a depth and purity of colour which is rarely seen in these parts. No doubt this is mainly due to the exceptionally pure atmosphere of the neighbourhood, and of the sharp light soil of which the nursery is chiefly composed, both conducing to the early and perfect ripening of growth in autumn. To the same causes may be ascribed the stocky thrifty appearance of the general stock of transplanted and seedling forest trees which are extensively grown.

Among Strawberries Messrs. Lamont find Marshall MacMahon the most reliable for their sunny slopes and light soil; it stands better than any others in dry seasons. James Veitch, among approved and tried kinds, is also a favourite with them, and ripening a little earlier than the Marshall—good breadths of it are sown for first crops. Among new kinds The Captain promises well to take a favoured place in this district, but experience is not yet large enough to warrant a decided pronouncement in its favour. King of the Earlies is also well thought of, especially as regards its cropping qualities, which are good, and, being unlike Black Prince—to which many liken it—in respect of the duration of its crop, which is continuous for some time—not a flush and done with, as in that variety—it is looked upon as an acquisition to the list of early sorts.

Of choice herbaceous plants there is very excellent selection, among which we noticed large stocks of *Hepatica triloba*, double blue; *Montbretia Pottii*, *Cheiranthus alpinus*, *Delphinium chinense* var. *alba*, double purple Rocket, *Papaver nudicaule*, grown in masses for the Edinburgh flower market, in which it is—especially the yellow form—a great favourite; a fine collection of Iris of the tuberous section of the genus, and many other popular and rare or scarce things.

Single Dahlias are largely grown, and much attention is devoted to the raising of improved varieties. Amongst the varieties not yet sent out are many of very superior merit. Those already in commerce are fully tested with the view of sending out next spring are all of improved form and distinct shades of colour. Crimson Paragon is an acquisition in the style of the well known maroon and purple variety of the same name; but with crimson and scarlet shaded flowers; Jane Wallace, with beautiful rose-purple flowers, boldly and symmetrically striped with crimson, is a very distinct and constant variety; Mrs. H. G. Murray Stewart, lovely bright primrose, edged with rose-pink, is very chaste and pleasing; White Paragon is the best white we have yet seen, having neatly formed flowers of about the size of the original Paragon, supported on stout stalks that throw them well up to view; James Cocker, bright crimson, deeply shaded and lined with denser tints of the same colour; Duke of Edinburgh, very perfect in form, and fine crimson lake in colour. These are a few of the more distinct named varieties of the last and present season's introductions, but there are many in hand equally distinct and desirable to be sent out next year.

MUSSELBURGH LECK.

More than half an acre of land is devoted to the growth of the true variety of this valued Leck for seed. It is a precarious but valuable crop, the bulk of which is raised in this neighbourhood. Every cottager having a little garden grows as much as he can spare room for, but all have not the true variety, which is distinct in many respects from any other sort, but especially so in its exceeding hardiness. No market gardener in the North will grow any other sort if he knows it, but so scarce is the stock of seed of the best sort in some seasons that the high price becomes a temptation to fraud, and the foisting of

spurious sorts on the seed vendors, leading not infrequently to serious loss and vexatious litigation between them and their customers, the market gardeners. The crops look well at the present time around Musselburgh, but as the flowers are only now opening it is too early to forecast what its value may be at the end of the season. Everything depends on the character of the weather during the remainder of the present and throughout next month. A.

EXPERIMENTS ON GRASSES FOR PERMANENT PASTURE.

MR. MARTIN J. SUTTON deserves the thanks of agriculturists for his trials of grasses at his farm at Kidmore, near Reading. The extension of pastures proceeds more rapidly than the knowledge of the comparative value of the cultivated grasses. Productive land capable of producing Meadow Fescue, Fox-tail, and Cocksfoot—three of the best grasses, which in fact suit almost all soils when highly farmed, is monopolised by such unproductive species as Dogstail, merely through the ignorance of farmers and of those obscure seedsmen who supply them with grass seeds. Those who are responsible for such ill-seeded pastures as we have sometimes seen might read a very useful lesson at Kidmore. Among the experiments some are directed to the improvement of an old pasture of inferior fertility by the use of various artificial manures, the results being similar to those at Rothamsted, where nitrogenous manures has been found to increase the yield of grasses, and mineral manures that of leguminous plants. The other experiments were undertaken for the purpose of ascertaining the best mixture of grasses for the formation both of permanent and temporary pastures, for the production of hay, which should not be composed of coarse grasses, and of grazing pastures.

Festuca elatior and *Dactylis glomerata* are both first-rate grasses when grazed, but they are far too coarse for hay. Some advisers who have found these two grasses admirably suited to their own soils and requirements have forgotten that general advice should not be based on a limited and special experience.

The same remark may be made in regard to Rye-grass, which has been depreciated in recent years on account of several alleged deficiencies. It is one of the most useful grasses on well farmed land and, as Dr. Voelcker found on analysis, one of the most nutritious. Yet in these days of rushing indiscreetly into print, it has been asserted that Rye-grass is an annual instead of a perennial, as any grass may be on an inferior soil—that its one year of life is a year too much, owing to its habit of choking its companion grasses and leaving the land barren—and that it ought to be entirely excluded from all mixtures of grass seeds used in forming permanent or temporary pastures. These assertions are strangely inconsistent with the fact that one-third of the bulk of the most productive pastures in Leicestershire consists of Rye-grass, which is always eaten down close, so that it cannot produce seed, and which has nevertheless remained perennial for a hundred years or more. There are no doubt many sorts of Rye-grass, good, bad, and indifferent. According to Sinclair, Russell's Rye-grass, the best variety at Woburn, yielded twice the weight of forage as a named sort bearing a good reputation which he tried against it; and we remember to have seen in Messrs. Sutton's trial grounds at Reading half-a-dozen varieties grown experimentally, side by side, and differing widely in their yield and habit. The trying, testing, and continual comparison at Reading are increasing, and they enable a painstaking and conscientious firm to advise a great many customers in that district differing widely in soil and climate; while it seems to us that those growers who have defamed Rye-grass are only competent to speak for their own land and their own particular circumstances.

Some light land at Kidmore was sown with the approved mixture of grass seeds for a permanent pasture, including Rye-grass, and in the third year the stronger grasses—especially Cocksfoot—have almost entirely replaced it. They were not choked in that fatal first year! But as these grasses do not yield a crop the first year, as the quick Rye-grass does, the latter has proved a profitable addition to the mixture. A good example of the different habit and value of different "strains" of the same variety of grass appears in the trial-grounds this year in the case of *Alopecurus pratensis*, a valuable early grass, particularly productive of aftermath. The whole of the plot was sown at the

same time, but not with the same seed, and one row proved so much earlier than the rest as to be ready for the scythe on May 26 inst., instead of June 11. As the value of this grass is greatly enhanced by its early habit, it is much to be desired that the characteristic we had noticed may be permanent. Probably it will be, by virtue of the same care and attention which have been bestowed on three sorts of Trifolium incarnatum, early, medium, and late, that are now available for the lengthened period of six or seven weeks, while the one original sort was useful only for about a fortnight.

As Messrs. Sutton's collection of growing grasses is one of the most complete in the United Kingdom, others besides agriculturists may gather useful hints from its inspection. It recalls to mind the great services which great traders may render to the public, and which we have frequently had to acknowledge in visiting the establishments of famous nurserymen and seedsmen. H. E.

THE SEED GROUND, BEDFORD, FELTHAM.

FEW of our gardening writers have done more to give publicity to the beautiful flowers and products others have raised or produced than has Mr. R. Dean, but few have been more reticent concerning his own things, which are grown at Bedford, or "Bede's Font."

VEGETABLES.

Potatoes are here a great specialty, not grown to produce specially fine tubers, as big samples are not so well suited for seed as are those of more moderate dimensions, but rather as a well cultivated field crop. The soil is stiff, but not "holding," hence it is subject to drought, much more so than are some other localities quite near; but soils vary appreciably, and thus it happens that, whilst too absorbent of moisture in the winter, it parts all the more freely with that moisture in the summer.

Good breadths of those sterling sorts raised at Bedford—Chancellor, Prime Minister, London Hero, The Dean, and Midsummer Kidney, together with other kinds, new and old, all looking exceedingly well; the late ones being robust, whilst the first earlies are gradually ripening off. There is in one place a batch of seedlings of last year's raising, the products of a cross between Prime Minister and Kadstock Beauty, and the result, both in tops and tubers, is singularly varied. In another place is a batch of the present year's seedlings from various crosses, the interest attached to Potato raising still holding sway, although in no case does it seem to lead to exceptionally profitable results.

A lot of Peas of various good kinds have cropped well, and are fast being harvested for seed. There is also a considerable breadth of Exhibition Scarlet Runners—a fine selection and very prolific.

For the first time Mr. Dean has taken to the growth of Seakale, both from seed and "sets," for the production of forcing crowns; and in spite of the early drought, and the arid condition of the soil even now, capital growth has been made, the seed-sown breadth, when thinned, having given results as fine as seen from this. It is evident that, with a fair season, very fine Seakale may be obtained from this soil.

The long-podded Negro Dwarf Bean shows a fine strain; for cropping or show purposes it would be difficult to excel this capital variety. The only Celery grown is the true White Incomparable—its special merit being that it stands so long before running to seed, and indeed it is one of the best white kinds in cultivation.

A recently introduced French Cabbage Lettuce—White Chavigny—is the only kind grown for seed, its chief merit being its ability to stand long without running to seed. It is indeed difficult to get it to produce seed the same season. A good batch of the true Snowball Cauliflower—a sterling variety which originated here—was noted, now going to seed. This is one of the best early kinds in cultivation.

FLOWERS.

In the direction of flowers there is much to attract attention. There yet remain evidences of the very fine and varied strain of Sweet William grown here, many of the later flowers showing great size of pip, and rich markings. A large breadth for next year's seedlings has just been got out, whilst the bulk of the present year's seed is harvested. Canterbury Bells are also largely grown, the strain showing numerous double flowers of great size and of very diverse hues. A batch of the curious strain of Canterbury Bells shows

huge flowers and much diversity of colours. A big breadth of several hundreds of plants has been got out for next year's seeding, and a very beautiful show will be seen then.

One of the most showy and useful of our garden flowers—the African Marigold—is particularly well done here, the colours ranging from lemon to deep orange. And to what a size some of the flowers attain! Some individual blooms measured about a foot

branching habit, and fully 80 per cent. of double flowers; and Giant Crimson Ten-week, almost rivalling a Brompton in height and size of bloom—all being spring sown.

If one were asked to name one of the special features in the flower way at Bedfont it would be Balsams; they are, indeed, very fine. The practice is to take them from the seed bed when about 6 inches high, and dibble them out. By this means they are

as they should, the display of these and similar popular and beautiful flowers.

Three good bedding *Tropeolums* were noted in Lustrous, rich crimson flowers, well set off by its dark foliage; Bedfont Rival, bright orange-scarlet; and compactum aureum, yellow: all good, and throw their flowers so well above the foliage. They may be termed perpetual bloomers, flowering till killed by frost.

FIG. 51.—CHRYSANTHEMUM ULIGINOSUM: HARDY PERENNIAL, FLOWERS WHITE. (SEE P. 274.)

in circumference, though not yet fully developed. The striped section, by themselves, presented quite a floral picture. Plants about 15 inches in height, very uniform, and clothed with flowers, some a rich chestnut in colour, others a bright crimson, and largely we find them perfectly striped, self, and beautifully edged. Also *aurea floribunda*, a bright golden strain, plants of compact habit and dwarf.

Summer Stocks constituted another feature—massive spikes of flowers, and comprising the well known Mauve Beauty, New White Intermediate, good dwarf

not encouraged to make too great a roothold, to the evident advantage of the flowering process, as was seen in the plants under notice. They were sturdy bushes of flower, almost concealing the healthy foliage, the prevailing colours being mauve, purple, crimson, carmine, pink, flaked, spotted, and other hues and markings.

These plants would cause a little sensation, and may be a due recognition of their undoubted claims to a more extended culture could they be "potted up" and shown at some of our exhibitions. Unfortunately, though, the managers of such do not encourage,

Lobelia, a compact very fine strain of the *speciosa* compacta type, a telling blue; also a fine pure white strain.

Pentstemons, remarkably fine and varied, a batch just passing out of flower; a second batch, fine young plants, spring-sown, coming into bloom.

The pretty and useful free-flowering variety of *Malva moschata*, in quantity, was very noticeable.

A strain of French Carnations, very pretty, worthy of record as being produced from seed—on certain soils (as here) an easy process of raising these plants, obviating the necessity of "layering" and "piping."

Fancy Polyanthuses—one of the specialties—a batch of 1000 plants in one quarter, planted out in the spring, many of them already in flower. These will doubtless present a pretty sight next spring.

Primroses are also a great feature, great quantities of plants, one, two, and three years old, being plucked out, whilst a big batch of seedlings from recent sowing of seed is just showing rough leaf. A general absence of thrips this year, aided by nice showers, has kept the foliage of these spring flowers unusually vigorous and clean.

Quilled Asters are very robust, and never better than this season. In passing, this appears to be quite an Aster year. These flowers seem to be doing well in most places.

Of *Antirrhinum* was noted a spring-sown batch, well grown, and in full beauty; whilst the seed from the early-blooming breadth has been secured, the ground being already prepared for *Anemones*, of which a superb strain is grown, roots in the beds already sending up foliage, showing a very short rest of not more than six weeks. A batch from seed is raised yearly.

Dianthus Heddewigii Brilliant, flowers single, large and beautiful—intense fiery crimson; the effect produced when the sun's rays are fully thrown upon the bed is striking indeed.

What effective border flowers are *Petunias*, as seen here! A good striped strain was very telling.

Much more might be said of several other noteworthy things in the flower way, but enough has been written to show that these seed grounds are replete with interest to those who take a pride in extending a knowledge of a class of plants that give beauty to our gardens—a class of plants, too, that is within the reach of all who love flowers.

We may well conclude these remarks by referring to a fine lot of trees of the *Fairleigh Prolific* *Damson*, ten years planted; they are breaking down with the fruit crop this year. This is a favourite market variety, and its fruitfulness certainly entitles it to this distinction. *B.*

ROOTS AND THEIR WORK.

(Continued from p. 257.)

APPLICATIONS TO METHODS OF CULTIVATION.

Seeds and Seedlings.—We have seen how delicate is the structure of roots after first being developed. The soil must be light, easily penetrated, and damp at the surface, for all plants whatever their habitat may be when fully grown.

Air must have access to soil—it must not “cake,” as stiff clayey soil is apt to do—the mere shaking of soil down in the seed-pot is sufficient for the purpose, except just a little pressure after sowing to flatter the surface.

BRANCHING.

The branching rootlets are apt to get broken, they should be removed from the seed-pot before of much length, and in pricking in the seed it is easily seen that a displacement of the soil to one side instead of boring a hole and showing the roots in, is the preferable plan.

POTTING.

At potting, if we cannot indeed judge from the seedling what is the habit of the plant, we can at least see of what nature the perfect plant is, and act accordingly. Had the plant a creeping habit, easily rooting from the stem, what folly it would be to press the soil firmly around the seedling. Were the roots very smooth and fibrous, plentifully produced, we should judge that the plant wanted plenty of water and a moisture-retaining soil. If our root branched readily we might judge that it liked a fairly loose damp soil. If there were naturally delicate long hairs and a hard root, stony places would be likely enough its natural home, and we should pot it firmly. As to wedging plants (alpinists) between stones, there is the danger of drying them to death—the stones and small pots if not planted becoming soon very dry. It is an excellent help in cases where there is no danger of this doubt.

REPOTTING.

In repotting plants great care should be taken to get the old and new soil of the same density, else if the new is looser the water passes through it when watered and leaves the original ball dry. Some potters slope the surface of the soil from the centre to

the circumference, considering that the roots are mostly formed at the edge of the pot, or on the further side of the old ball, therefore it is best to send the water to the side. Others prefer that the soil should be quite even, so as to secure an equal distribution of the water. This seems reasonable when it is considered that the slope of the pot will cause the outside to get most after all. It is, however, very objectionable indeed to see a hole in the surface of the soil into which the water always runs, and so goes only through one part of the “ball” thoroughly.

If the ball be dusty it should be shaken out or else water never penetrates it, although as a rule there is not much root in the centre of the ball of pot plants.

In cases where the roots are very fine indeed and make but slow growth the roots penetrate right through the ball. The best known case of this is to be met with in the *Cape Heaths*. Where the growth is so, it stands to reason that the “shift” in potting should not be great, and where the root is very fine it may be taken for granted that it naturally grows in a hard, somewhat dry place. These fine roots and long root-hairs need the more careful treatment.

In repotting also, except among coarse, easily branching roots (those of not too hard texture), care should be taken not to break the “ball,” or the chances are that the greater part of fibrous growths of the root be broken away, when the shock caused by evaporation subsequently is too much for the plant.

Nor in slowly growing hard roots, which do not give off branch roots, as *Heaths*, should the fibre be disturbed more than possible, certainly not broken by poking among them with pointed sticks.

WATERING.

Watering is considered about the most difficult part of plant-culture to manage well. That the soil shall not be too much saturated with water is quite as important as that it shall not be too dry; in the latter case the flagging is readily seen. Where saturated with water the soil is cold—if not decaying—and the needful warmth is absent which causes the delicate growing roots to develop. Especially should this be taken care about where a plant is newly “potted on.” The larger mass of soil retains the water more readily, and the roots cannot take it up quickly enough; and similarly, if a “ball” is not fairly well covered with roots, it is hurtful to water it much even if the leaves are large and appear as though they would draw water up quickly.

DRAINAGE.

As to the drainage in pots, it is well to have a considerable amount where the roots do not—as, for instance, in *Gleichenia*—penetrate deeply. The plant may like a great amount of water about it, but it does not want stagnant acid-generating soil, which if the drainage is clogged is apt to occur. To pour water on freely and let it pass off freely is a better plan. For the same reason it is well to have the soil porous, not to allow too much fine soil to remain in the potting mixture, though among common plants—and coarsely rooting plants especially—of course is not worth while to riddle the fine away. We may notice that when the drainage is blocked up the roots have a tendency to grow to the surface again. At times we may see pots well filled with roots at the surface, and roots absent entirely from lower down the pot. This shows that the roots object to a water clogged soil. A considerable length of root, as in *Imantophyllum*, indicates great capabilities for absorbing water.

In many cases one is tempted to moisten the surface only of the soil in small pots. This, though beneficial, on account of the damp, to the leaves, is likely, unless very carefully managed, to be productive of harm. The bottom of the “ball” may be dry whilst damp at the surface—a most ruinous state of things, quite contrary to Nature. Top-dressing is very much to be deprecated also, for a somewhat similar reason—the fresh soil looks dry, and water is given, saturating to a hurtful extent the old soil of the ball below.

It is much more advisable where possible to plunge all small pots in sand, which keeps them uniformly damp throughout, and is more natural as ensuring that the dampest part shall be at the base of the pots.

SYRINGING.

Syringing, though invaluable in many respects, has just this drawback, that the surface is damped, the

base of the ball not; if well-managed, however, it is a most necessary aid, especially just after potting plants, where, through the roots being broken, and the leaves continually evaporating, there would not be a sufficient amount of water in the tissues; did not syringing allow of its entering largely by the leaves.

PLANTING.

In planting care should be paid to the physical nature of the soil especially. For example, there can be little pleasure in seeing a creeping plant growing on a dry sunny place. Wherever roots grow freely from the prostrate stems there must be a fair amount of moisture in the very surface soil which will attract them and admit them readily into the surface. Trees moved should be as little injured in the fibrous part of the root as can be; and it has again and again been pointed out, that as the ascent of the sap is more vigorous in the spring and summer months, when also evaporation is excessive from the leaves, transplanting should be done in winter or autumn, when there is no great amount of leaf in deciduous trees, or less evaporation.

ROOTS MOVING BEFORE LEAVES.

Many plants make vigorous roots and do not produce leaves until later. I remember lifting some rare plants (*Ranunculus Lyalli*) growing in a boggy place because the leaves were poor, and as winter was coming on it was thought as well to take the plants under glass. After having dug them up we noticed how vigorous and strong the roots were. The planting and lifting in such conditions ruined the plants. It would have been much better to have slightly protected them in the open place where they grew, had we judged from examination of root as well as leaves before disturbing them.

Roots of many rhizomes, as in *Anemone fulgens*, *A. nemorosa*, &c., move before the leaves do; therefore it is well to plant or pot these in the autumn, that growth of root may have taken place before the conditions favourable to leaf growth are present in the spring time.

An example of the dependence of root and leaf was given me the other day by one who had grown *Vines*. They made leaves vigorously the first year, and were not cut back until late; the grower knew that whilst making leaves they were also developing strong roots, which would be of great help the next year after the stem had been cut back. This was an example of thoughtful pruning. The grower allowed all the leaves to be developed fully before cutting back his stem, which is generally the case in pruning, I believe.

PRUNING.

In cutting stems either for pruning or grafting great attention should be paid to the strong ascent of the sap before noticed. In one plant the time for the strongest ascent differs somewhat from the time for it in others. I am told that this bleeding from a tree has been known to continue even after the cut end had been painted and treated in many ways, the ground just under the branch being continually moist from the sap exuding.

Early or late pruning would either be preferable to pruning in the middle of the growing season, but where possible late pruning seems to me the most recommendable as regards the caulusing of the place cut, whilst early pruning is better where the parts left are wanted to “break” or make buds quickly.

Illustrating the dependence of leaf and root, an old story is told by one of our nurserymen to the effect that he once was growing *Asparagus* a long time ago, and having to get a walk clear through the bed he tied string on either side of it, which string supported the stems. The leaves or finely branching stem were produced more profusely, and the roots of the tied-up plants were as a result far the best in the plot. Those which had bent down had stopped the circulation of the sap, and therefore prevented the full development of the parts of the plants. *Asparagus* is now often grown against string supports.

SHIFTING PLANTS.

It is said to be well for [some] plants to be pretty frequently transplanted. Bulbs growing together and dividing, are of course enabled to swell to larger sizes if shifted, and the soil below them has much of its nutrient properties extracted. All soil has a tendency to become close also, and this is hurtful, as the air so necessary to sweeten it does not have access to the particles of soil. It is harder for many plants to root if the soil be very close.

MANURES.

In applying manures also, it is well to consider their effect upon the physical condition of the soil. Farmyard manure contains matter which has to decompose, and its effect is to split up the soil and keep it "lighter" for some time. When the roots are consequently benefited by these as well as by the chemical properties of the manure. No such effect is produced by the smaller quantity of phosphates, or the like artificial manures. A surface soil if well manured, should not be dug into a considerable depth; unless the soil is very light and poor, this trenching is not advisable to prevent it becoming too stiff. It is but a poor remedy, some very light sandy or rubblely material should be added.

LENGTHS OF ROOTS.

Roots descend to different lengths; this fact is made use of by farmers on laying down grass land. It would be useful in our lawns, and I should think that a deeply rooting grass, for instance, would have a better chance of growing well in a place which was likely to be baked in hot summers.

SOILS.

Also if roots thrive particularly in special soils, they should have some attention where possible given them in the way of supplying them with similar constituents. But far more important to my mind than supplying plants with soils of different chemical composition, is to give them those which retain more or less moisture in accordance with the positions in which the plant has grown. It is of no use to give a plant a peaty soil of a loose nature, and then expose it to the fullest sun. Peat and excessive moisture are generally associated in Nature, and we should not dissociate the two in practice. This is but one example out of many.

Plants with running roots, too, should, of course, have a light soil, through which they will be able to easily send their shoots, and by way of practical advice I may say that peat, unless very sandy, or with leaf-mould, does not form the most easy substance for roots or runners to pierce; especially in pots it is apt to make a very tenacious "ball."

Plunging in sand is a capital attempt to remedy the artificial isolation with which we visit plants when potted.

GROWTH.

I have thought that perhaps plants in pots, as is the case with many trees grown especially for fruit, did not at times produce roots vigorously at the expense of the rest of the plant. I have seen a *Dactylis* hanging over a bank, and sending out 15 inches of fibrous root without seemingly contributing any fresh leaves to its parent plant.

In hoeing, we should not just cut off the tops of such roots as *Dandelion* and *Polygonum*; we find that they grow again. The plant should be taken quite out of the soil, or at least the root cut well down, so that the greater part of the thicker tap-root is pulled out.

We often ask, "What time should cuttings be put in, or grafts made?" We should look to the structures of the tissue, and see when such are fairly ripe, and not too woody.

Where Orchids are grown in the air they should, of course, have a damp atmosphere kept up, and many of our pot plants would be better grown if we sprinkled water oftener on stands and about the pots.

I have not been able in this essay to give any definite ideas as to how to judge from roots as to whether they should be placed in one place or another—whether, for instance, they are damp-loving or the reverse. This has been hinted at, but time has forbidden any minute examination as to these and similar suggestive questions. [This may often be seen from an examination of the microscopic structure of leaves and roots. ED.] We can all tell, for instance, if we see a root growing in moss at the surface rather than in the soil below, that such a plant likes open damp compounds of a light nature to grow in. Such facts and observations we can continually turn to account.

In conclusion, however, I would say that most are not too ready to throw over all "rules of thumb" because they are old and we are new, and cannot see reasons for them at first. We have many times in the investigations required for this essay been unable to find any reason, much less the right one, for various results we have met with; how important is it, then, that in our own practice that we should be

reasonable enough to accept all rules of thumb when we see them producing good results, only breaking such rules when we can better the result. Our reasoning as to cause and effect should not be with the object of breaking down these old traditions of experience, but in the honour of our noble profession to show the common and reasonable sense which underlies them. P. Sewell.

FRUIT AND VEGETABLE GARDENING.

SEASONABLE HINTS. — It is often a subject of comment how long it takes the world to profit by a good idea, and the potting of young Strawberry plants, preparatory to setting out in autumn, is a case in point. It is getting on towards a quarter of a century since we made the first suggestion in the *Gardeners' Monthly* that it would be well for those in the trade to prepare for such a demand. At that time it was thought the time would soon come when the demand would arise, and inventors set themselves to prepare for it by schemes to get the plants potted cheaply. Among others, our ingenious friend Dr. Ryder, of Chambersburg, in Pennsylvania, invented a very cheap basket, costing almost nothing, which the grower could use and sell with the plants without missing the expense. But nothing came of it. Few people seemed to understand that a plant that cost a trifle more than another, but gave a good crop of fruit a few months after planting, was as good as a cheaper one that took eighteen months to bring the full crop. Hence, when one had prepared the plants there were few buyers, and the labour was wholly lost. This operated also against the use of the cheap boxes. They were no use at all after being once set in the ground; by a small flower-pot could be used again, though the plant in it might have to be thrown away. So regular flower-pots are still in use for setting the runner in. But now that everybody understands the superiority of potted plants, and even for large plantations only potted plants are found worthy of use, it is a question whether some such a plan as Mr. Ryder's might not be considered with some profit.

It will be seen that the original intention was to include the growth of all plants intended for summer bedding. The boxes are too large for Strawberry runners that would be only a few weeks growing in them, for they should be a little "pot-bound" in order to take little room and have little weight in travel, and we think the round form—a form like a box made for salve—for all the waste of space in packing, better than the square. Our object is not so much to commend this plan exactly as it is to set inventors to improving on the idea, now that the "long felt want" has arisen. Dr. Ryder says:—"Strawberry plants, &c., that have well filled the box with roots sufficient to hold the ball of earth together, will pack secure without the veneer, and, being square, they pack close and carry safely. When Strawberry runners are to be layered, the plants being cultivated in rows and the ground in mellow condition, we use the tool or dibble to make the impressions in the ground, using a second tool or plug a little smaller than the first, and made square at the bottom, to press the box flat down until they are even with the top of the ground, the soil slightly compressed outside, when the plug is withdrawn and the box is ready to fill with soil, all of which is performed very rapidly. The point below the square provides for drainage, as my experiments amply illustrate."

It is interesting to note what a revolution this introduction of potted runners has caused in the whole field of Strawberry culture, and how changed have to be the "Seasonable Hints" in consequence. The old boys can no doubt remember the warm discussions about mowing of the leaves of the Strawberry in autumn, in order that the beds might bear better the next year. In those days a Strawberry bed was like an Asparagus bed in this—that, once made, it was to continue a number of years. The beds were soil mats of "sod," and almost like a lawn passed over by a modern mower after the annual mowing when the fruit was gone. But who sees a matted Strawberry bed now? The potted runner, if well potted, and the bedded plants, if well bedded, will give the best crop the next spring after planting. And thus it comes about that those who strive for excellence find it pays to have new beds every year. Those who do not have the very best potted plants find the second

year's crop the best, but very few in these days care to keep the same Strawberry beds for over three years. The "third term" is not popular with Strawberry growers now. Rotation in office prevails as a political dogma among Strawberry growers. One thing is certain, that a first-class potted runner, set out in August or September, the plants 1 foot apart and the rows 18 inches, with every third row 2 feet from the others, to furnish a pathway for fruit cutters and fruit gatherers, will, if the ground is made suitable to the Strawberry, in all probability do its best for its owner the first season after setting out.

In old times it was a caution not to make the soil too rich for the Strawberry. They would go all to leaves it was found. Under the new system it seems almost impossible to make the soil too rich, so long as the manure is thoroughly incorporated with the soil, and the ground not a mere rank manure-heap. And a deep soil that will not dry out when a few hot suns shine on it, with a situation where there is an abundance of light, and yet not exposed to the full rays of the sunlight without heat—this is found to be the essence of all that is good in modern Strawberry culture. The doctrine of the wearing out of varieties will rarely get an illustration from the Strawberry grown under these conditions. The spotted leaf—the fungus that interferes so much with the long-congenious plants that in the strictest sense we may call diseased. The philosopher may, with some show of facts, insist that the plants are healthy, and that the fungus is the cause of all the trouble, but we who have watched the course of cultivation through the long years past know that "something is wrong" before the "wearing out of the variety" began. *American Gardeners' Monthly and Horticulturalist.*

Orchid Notes and gleanings.

CHOICE ORCHIDS IN FLOWER.

We have received some beautiful blooms of Orchids, together with the following notes on them, from our old correspondent, Mr. Swan, Howick House, Preston:—

I herewith send for your inspection several blooms of some rare and handsome species which I thought you would be pleased to have an opportunity to inspect.

Cattleya Dowiana is, without doubt, the most beautiful of the late summer-flowering forms. We grow this in a basket in the *Cattleya*-house, together with *C. Mendelii*, *C. Gaskelliana*, &c., and capital growths have this year been formed on it. The short interval that elapses between the first appearance of the points of the buds through the sheath and the expanding of the blooms is noticeable in this species more than in any other. The rich yellow sepals and petals, streaked in some instances with crimson, and the broad labellum of a rich crimson-purple lined with a beautiful golden-yellow, make it distinct and attractive.

The flowers of *Cattleya superba* were cut from a plant grown in a basket hung in the East India house, just above the *Aerides* and *Vandas*. The spike produced five good flowers, one of which I send you.

C. velutina is also grown in a basket in the *Cattleya*-house. The plant in some respects resembles *bicolor*, the leaves, however, are rather more pointed and darker in colour than many *bicolors* that we have. The pseudobulb is about 18 inches high, and has produced five flowers. The sepals and petals are brownish-yellow, spotted with purple. The lip orange at the base, then white, with violet veins in front. It is curious to notice the manner in which the column of *velutina* is pressed down into the middle of the labellum.

C. crispata, a good and useful old form. The flower cut is from an imported plant, which has flowered with me for the first time. *C. Eldorado* is one of the many varieties of this summer-blooming species. Of this form of *C. Gaskelliana* we have had several in flower, and found that scarcely two are alike. In some respects it resembles *C. Warneri*. It however flowers about a month or six weeks later than that variety.

The bloom of *Laelia monophylla* was taken from a plant fastened on a block, and growing in a house with *Lycastes*. The plant is very different to what we usually expect to find when speaking of *Laelia*. In

growth it is like a small growing *Masdevallia*. The bulb is about 2 inches high and no thicker than a Rush, or a single stem of grass. The leaves are single, and from the centre of the leaf the sheath appears, then a stem 4 to 6 inches appears, which at length produces an orange-scarlet.

Lelia Amanda is also grown in a basket; it much resembles *L. Schilleriana* in growth and general appearance. The sheath appears as soon as the growth is finished and the flower-buds quickly push through. Two flowers were produced, and though not so showy as many, it is still very pretty. Sepals and petals light rose, lip deeper rose, with rich crimson venation.

CATTLEEA GRANULOSA (*Lindl.*) ASPERA, *n. var.*

A very fine *Cattleea granulosa* with brownish sepals and petals spotted with dark purple, lip yellow at the base, anterior part finest, mauve-purple with a broad white border. The anterior surface is rough all over, and the asperities are partly formed by filiform processes, partly by serrate keels, which altogether gives a new aspect. I had it from the Editor of the *Gardening World*, who obtained it from Major A. F. Leidy, Sunbury House, Sunbury-on-Thames. *H. G. Rehb. f.*

The Apiary.

BEE PLANTS.

In conversation with an enthusiastic apiarian friend he mentioned the names of the following plants as essential to the bee-keeper, recommending them to be planted within reasonable distance of their hives, viz., *Salix caprea*, or Yellow Palm. Bees are very fond of this plant, it being (when in bloom in spring) completely smothered with the busy workers. Sweet herbs, particularly the Thymes of sorts. Some bee-keepers think that bees do not obtain much from Borage, but it is found that they are extremely fond of it, and it should be sown largely in every spare nook and corner; it is one of the most useful bee-flowers—late and continuous. To resume our list:—*Acer saccharinum*, *A. rubrum*, *A. platanoides*, *Tilia argentea*, *T. leptophylla*, and, where there is room, the following are also good bee-plants:—*Centaurea cyanus*, *Rosemary*, *Hyacinth*, *Almond*, *Wallflower*, *Gooseberry*, *Plums*, *Turnip*, *Broom*, *Sweet Brier*, *Marsh Mallow*, *Bean*, *Mustard*, *Radish*, *St. John's Wort*, *Ivy*, and many others.

There is no honey equal to that made from the *Gooseberry*, *Raspberry*, *Currants*, *Borage*, and *Mignonette*.

Just now the bees are busy at work on the *Borage*, *Mignonette*, *Marrows*, *Maples*, and the *Snowberry*. As they are hatching out young brood they are laden with pollen, principally from *Marrows*. This is not by any means a good honey year, and bee-keeping is not the profitable investment it was formerly—it is overdue. Where ponds used to be made, shillings now represent the takings. Honey buyers will not buy the sugary mess that is often put into the market in the name of honey, and so injury is done to legitimate traders. *B.*

BEE FLOWERS.

Honey farmers have not the least objection to their myriads of bees plundering honey from other people's flowers, and would be the last to acknowledge the obligation by sending title of their honey harvest to the florist or gardener whose floral beauties have been thus poached upon. The best thing for flower growers to do, no doubt, is to keep bees themselves, but all have not the time to attend to the wants and necessities of the insects. Has it ever occurred to any of these bee-farmers that they should accept some of the responsibilities of their position, and provide flowers for their bees, as sheep-masters have to provide pasturage for their flocks? Not a few of these bee men have scores of hives and scores of thousands of insects to feed. How many of them have obtained the use of some few acres of ground and grown bee food?—probably not one. If any are so disposed to be honest, let me advise them to grow every year about an acre of some strong growing *Mignonette*, such as *Parsons' Giant White*, perhaps the best branching kind we have. Such a breadth would alone afford food all the summer and autumn for a million of bees, and should [far] away [re]pay for [rent and seed outlay as well as labour in the harvest of honey obtained. There is no garden flower that is so much favoured by bees as *Mignonette*. *A. D.*

LAZY BEES.

Dr. Watts still deserves respect for his moral sentiments. The bee is lazy unless impelled by necessity. "Birds in their little nests agree" only so long as they do not fall out. The Rose is not now the glory of April and May; but all these may have appeared differently to the worthy Doctor "sixty years since" from what they do to us now. I know from personal experience in the Colonies that bees will not work whilst they have honey, or a substitute at hand, and on one occasion I saw a swarm lazily hainging to a church at Sydney listening to the music, and then transfer themselves individually to their respective stores of food in the Domain (Botanic) Gardens. Bees selecting food from poisonous plants is a subject worthy of investigation. *S. A.*

RED AND WHITE CURRANTS ON THE SAME STALK.

The curious abnormal growth (fig. 52) of both red and white fruits on one and the same stalk, was sent to us by our old correspondent, Mr. Divers, of

FIG. 52.—RED AND WHITE CURRANTS ON THE SAME BUNCH.

Ketton Hall Gardens, together with the following note:—"I am not aware if the origin of this fruit is definitely known, but the bunch enclosed goes a long way towards proving that it is merely a sport from the red variety. It was found growing on a bush of the red kind, and has three red berries, three white ones, and one white with a red stripe. All the others on the same bush were red as usual." [For similar cases see *Gard. Chron.*, 1842, p. 873; 1844, p. 87; 1855, p. 646; and Darwin's *Variation of Animals and Plants*, 1868, vol. i., p. 376. Ed.]

DISEASED VINES.

We publish below a letter from a correspondent who has Vines which appeared to him to be affected with fungoid growths, and also the reply of Mr.

FIG. 53.—THE DOWN OF VINE LEAVES (B), WITH THREADS OF VINE MILDEW (A). ENLARGED 200 DIAM.

Worthington G. Smith, to whom the matter was referred:—

"Enclosed please find samples of a fungoid growth infesting a Black Alicante Vine growing with others in a

viney near here. The plant was but slightly affected last year, but this season is fairly covered with it, while the neighbouring Vines are taking it on as well. Can you suggest any cause, or remedy? It is identical with any form of mildew written about in the *Gardener's Chronicle* for May 15 and 22 last, we can, of course, adopt the men advised therein. *W. L.*"

The "fungoid growth" which you say is now "infesting" your Black Alicante Vine, is the natural down or hair belonging to the plant, and is a sign of robust health. There is no fungus. Downy and hairy leaves are often sent to this office with a request for the name of the "fungoid growth infesting" the material. All mildewed leaves exhibit signs of damage, ill-health or deformity. We have not yet heard of the down and hairs of Peaches and Gooseberries being mistaken for "fungoid growths," but all readers of the *Gardener's Chronicle* will remember the recent dispute about the Strawberries which were disqualified because certain judges mistook the downy bloom for mildew. The worst effect of growing downy Vines is that sometimes gardeners sulphur such Vines tremendously in futile efforts to keep down the down. Correspondents write and say "sulphuring seems to have no effect on the fungus." The result of the over-sulphuring and root doctoring is—leafless rods and rusted fruit. The latter in due course reaches this office for an opinion. Microscopists often make the same blunder: even fungologists have slipped. The fungus (?) named *Acalytophora nervisequa*, Desm. (sweet name) of our text-books, consists of nothing but common leaf hairs. There has been a fight for this fungus amongst the professors; one school has claimed it for the Pucciniei, another for the Torulacei,—wonderful!

A small drawing often explains a subject better than words. The accompanying illustration (fig. 53) shows the down found on Vine leaves, amongst which are a few threads of Vine mildew, enlarged 200 diameters. The fungus threads seen at A are of very small diameter, whilst the down natural to the leaf, as seen at B, is of very much greater size. Both growths are quite transparent and colourless, but the threads which form the down of Grape leaves are twisted in a screw-like manner. The down is much firmer than the fungus. Gardeners need never fear mildews if there are no bad effects visible; in fact, sometimes, when gardeners send downy leaves to this office, they write and say, although "the Vines are infested with disease, they seem none the worse for it, but bear well." *W. G. S.*

SELENIPEDIUM CAUDATUM.

THIS specimen of which we here give an illustration, fig. 54, is one which would not have thrown an Orchid grower into ecstasies, but it was one to confer serene joy upon the botanist. *Selenipedium caudatum* is in all cases a striking species, while *Uropedium* attracts attention from the regularity of its form.

It was natural to suppose that *Uropedium* is only a peloric form of *Selenipedium* but this was doubted by Professor Reichenbach.

Perhaps the present specimen, which was sent us by Mr. Bull, may serve to solve the doubt. In any case it is a great and interesting curiosity, for it has three separate sepals, two long petals, and a lip which is trying to emulate the petals, and is as it were half-way between the ordinary bag-like lip and the long-tailed petal. But the column was the most interesting part of the whole, inasmuch as it bore three perfect stamens, so that the inner row of stamens was in this instance complete, and the lower median stamen, a 3, of Darwinian notation, even shaking off its usual reticence and showing itself in the place reserved for it; the outer three stamens, as usual in *Cypripedium*, were absent or only present in the form of staminodes. In the appended diagrams A 1, A 2, A 3, represent the outer barren stamens; a 1, a 2, a 3, the inner stamens; sm, the stigma; P, the petals; L, the lip. We may here state that within the last few months we have received specimens showing in different cases stamens varying in number from one to six, the majority of the stamens being in some cases fertile in other cases barren, while in other instances all six were present in the guise of petals, as in *Cypripedium Sedenii* x. At fig. 54, p. 269, are shown the entire flower; at A, a cross section of the three-celled ovary; at B, side views of the column, magnified, and a plan of the arrangement of the parts. *M. T. M.*

COLOUR DESCRIPTION.

HAVING procured a copy of Field's *Chromatography*, so strongly recommended at p. 118, I find the subject treated in a scientific manner, and at the same time both tersely and explicitly. Any one, whether gardener, artist, or what not, would derive considerable pleasure, not to say instruction, from a careful perusal of its pages; but the reader could scarcely fail to perceive for whom the book is intended. This is especially evident in the third part of the book, which treats of pigments individually, briefly describing their hues, composition, qualities, and leading properties. This undoubtedly is an incalculable boon to the artist, who can buy the pigments under the names given, and so obtain a practical acquaintance with them. The case is altogether different with the gardener who desires to become familiar with different hues, so that he can describe them after a certain standard. In his case mere description conveys but little without some tangible illustration for the sake of comparison, which is, after all, the best vehicle for the conveyance of knowledge by comparing an unfamiliar object or colour with a familiar and well-known one. From this point of view, then, the subject at issue, namely, a book on colour for the use of gardeners, botanists, artists, and all those who have anything to do with plants or plant description, is still an open question; for a book to be of direct practical value in such cases should not only describe, but contain an exhaustive series of illustrations. The hues and tints to be found in Nature are practically endless, but a limited number, even of the natural colours of most importance and of the most frequent occurrence, would be of incalculable service to those who merely wish to describe them as nearly as possible according to some recognised standard. Knowledge of this description would prove of special value in the case of the great Orchid family, where a proper definition of the tints and hues is of more importance than many botanists seem inclined to admit. In numerous instances structure only is described, with no attempt at colour, notwithstanding its importance for horticultural purposes. This latter statement is borne out by the numerous forms of *Cattleya* in cultivation, especially of the *C. labiata* type, such as *C. l. Mossiae*, *C. l. Mendelii*, and *C. l. Percivalliana*, where structural differences are so slight as to be of small practical value for descriptive purposes. Correctly painted and coloured plates in this instance constitute the most fitting and lasting description that could be made of such forms. Even here in many instances artists differ more widely from one another, and from the natural colours, than is desirable or warrantable.

In the book above mentioned colours are defined according to what are termed the three "constants of colour," namely tone, tint, and hue. By the first is meant the total amount of light sent to the eye, or, in other words, its luminosity. Tint, on the other hand, signifies the richness or purity of a colour, and its freedom from admixture with other colours, although this is a thing that seldom happens with natural bodies, and above all in the flowers of Orchids. The analysis of the solar spectrum gives the purest and most suitable standard colours for comparison. What in common language is generally defined as the colour of anything is here spoken of as its hue, which depends on the wave length of light that produces it. This is described by reference to the spectrum, which forms the first plate, where red, which has the longest wave lengths, is at one end, and violet, having the shortest wave-lengths of light, is at the opposite extremity of the spectrum. Plate ii. treats of chromatic contrast, and plate iii. of achromatic contrast, while plate iv. treats of the chromatic and achromatic contrast of colours. All this is evidently intended for the artist, and undoubtedly of great service in the mixing of colours, showing what effect one has upon another, and the effect of contrast. The number of colours, however, is too small to be of much service in colour description.

The scientific definition of what determines the colour of a natural body, by its absorption of certain rays of sunlight and rejection of others, is of primary importance, and determines with much accuracy wherein the difficulty lies that the artist has in reproducing natural colours. In many instances several colours are rejected, which being diluted by white light produces a very complicated effect. For instance the perianth of *Bessera elegans* is scarlet externally, and cream coloured internally, with a scarlet midrib and margin. In daylight the cream

FIG. 54.—SELENIPEDIUM CAUDATUM: INTERMEDIATE BETWEEN THE ORDINARY FORM AND UROPEDIUM. (SEE TEXT, P. 268.)

colour acquires a difficultly describable shade of pink. The filaments are crimson, the style and anthers deep blue, and the pollen green. Many species of *Crocus* exhibit a similar blending of colours on the two surfaces of the perianth.

Miles on the artistic method of mixing colours affords another excellent explanation of the effect of the association of different colours in close proximity, and the resulting phenomena that greet the naked or unassisted eye. In practice, the artist, instead of mixing his pigments to produce the desired effect, paints them in small spots or very fine lines of different colours in close contiguity, and these becoming diluted and blended one with another by the action of light, present altogether a totally different appearance to the naked eye, and produce a far finer effect than the same pigments would have done if mixed together, demonstrating that the mixture of colours and the mixture of pigments are productive of very different results. This is very similar to what takes place in a state of Nature, especially in the case of variegated flowers, and particularly amongst Orchids, such as *Oncidium*, *Odontoglossum*, and *Epidendrum*. If the various spots and lines consisted of primary colours, the difficulty of reproducing them would be reduced to a minimum; but they are mostly secondary colours, and often produced by various coloured pigments in different but contiguous cells. The microscope also reveals pigments blended in the same cell, especially green and yellow, sometimes brown and yellow, or other colours. In some instances, what appears to the naked eye as a uniform moderately rich tint of violet-purple, is shown by the microscope to be produced by pigment occupying less than a half of the cells composing the surface of the coloured object. The rest of the cells are colourless save for the nucleated protoplasm, &c.

The Herbaceous Border.

AUTUMN FLOWERS.

It might have been thought by those who have seen the profuse and continued display made by Mr. Ware in the conservatory at South Kensington that he could not possibly have any to spare. The demands of the West, however, do not suffice to exhaust the resources of the East. We have before us a set of showy herbaceous plants, which Mr. Ware sends to show what a display may be made by their use. Composite, as usual at this season, predominate, but they are not all yellow, as some people in their haste say, for here is *Aster Townsendii*, a relatively dwarf species, with the upper leaves ovate, sessile, and with terminal heads of flowers $\frac{1}{2}$ inch across, with blueish-lilac rays surrounding a central yellow disc, and begirt by an involucre of small rolled bracts in many rows—one of the most distinct and pretty of its class.

Rudbeckia purpurea, with solitary flower-heads 3 inches across, with an involucre of many rows of short lanceolate bracts. The ray-florets are a deep rosy-lilac colour, reflexed, and surrounding a dome-shaped disc, the most striking feature of which consists in the stiff erect scales, like so many little spears surrounding the inconspicuous disc-florets.

Aster ptarmicoides, as its name implies, is like *Achillea ptarmica*, and might be mistaken for it by superficial observers. Its narrow, linear leaves, however, are entire at the margins, and the floral structures like that of the *Aster*.

A. gymnoccephalus is a very distinct form, with small, sessile, lanceolate, deeply serrated and wavy leaves, with small flower-heads about an inch across, with involucre of many rows of small, recurved bracts, surrounding a ring of rosy-lilac ray-florets, and a central yellow disc.

Of yellow Composites Mr. Ware sends *Harepoclea Leichtlinii*, a plant with grey stems, marked with small purplish spots; the leaves are oblong, lyrate, deeply pinnately lobed, dark green above, cottony-white beneath. The flower-heads are like those of a *Gazania*, 2 inches across, with a cup-shaped involucre of many rows of flat, tightly-packed, lanceolate scales surrounding a ray of many yellow strap-shaped florets, brownish on the lower surface. The disc consists of numerous yellow florets.

Siphium laciniatum is a tall, coarse-growing perennial, with deeply and repeatedly pinnately cut rough leaves and large heads of yellow flowers, like

a small Sunflower. This is the famous Compass-plant so often alluded to.

Helenium grandiflorum is like *H. autumnale*, but the rounded disc is of a rich purplish-brown, contrasting well with the broad ligulate florets of the ray. *Helianthus spicatus* reminds one of *H. rigidus*. It has broad lanceolate rough leaves and very showy heads of deep yellow flowers, 3 inches across, surrounded by an involucre of oblong appressed bracts.

H. multiflorus, var. *maximus*, as its name implies, is a large-flowered form of a common cottage-garden plant, with numerous lanceolate spreading bracts surrounding its brilliant yellow ray.

Lastly we may mention *Asclepias tuberosa*, the singular brownish orange coloured flowers of which are very attractive, but so complex in structure as to defy popular description though interesting to the botanists.

SALVIA PSEUDOCOCINEA.

So many species of *Salvia* are in cultivation that it might seem superfluous to mention any of them, but it is evident that much more might be made of this, as well as numerous other species, both easy to cultivate, free flowering, and possessing brilliant coloration of many hues. Cultivation in pots is but one point in their favour, notwithstanding their value for indoor decoration during the autumn and winter months. The front of shrubberies, herbaceous borders, or even rockwork, might be enlivened by their brilliant hues, using the dwarf and finer sorts in the latter case. In a mixed bed in the botanic grounds, Kew, where a number of species are planted in groups, *S. pseudococinea* is conspicuous for its dwarf branching habit and floriferous character. The flowers which individually are not very large, are bright scarlet, with two white lines in the throat. The lower lip is the larger, and like that of many species, constitutes the most conspicuous part of the flower. The plant is very common in several parts of South America and Mexico, originally introduced in 1797, and by some recorded as hardy, while others consider it as a stove plant. Although it is so perfectly amenable to outdoor cultivation in summer, it is more than probable it would succumb in all but the mildest winters. Rich fibrous loam, kept open by a sprinkling of sand, and even stimulated during the flowering period by artificial manures, will grow the plant to perfection if cultivated in pots. The plant is extremely variable under different kinds of treatment, indoors or in the open air, both as to hairness of the leaves, flowers, or stems, and the relative breadth of the foliage. The figures given in the *Botanical Magazine*, 2864, and Paxton's *Flower Garden*, 40, show this to some extent. F. F.

The Flower Garden.

PROPAGATION.

LET the propagation of the different kinds of bedding stock have diligent attention. If any of the earlier batch have missed, no time should be lost in making good any deficiency. Those put in now will require the assistance of a little artificial heat; an old Cucumber or Melon bed with the heat almost spent will suit the purpose. Where the cuttings are too thick in the pots it will be better to sacrifice a few than have them overcrowded, or they may be transferred to shallow pans from 2½ to 3 inches each way, keeping them close and moist till they have established themselves, when they should gradually be inured to light and air.

CUTTINGS OF AMPELOPUS.

This is a charming thing for covering tree stumps, old walls, &c. Associated with *Ivies* of the variegated type it makes a splendid contrast with its Vine-like leaves. There are three kinds which are well worthy attention—*hederacea*, *Veitchii*, and *Ruleii*; this last is the smallest leaved variety of the group and the brightest in autumn. Cuttings of the various sorts of *Cupressus* may also be put in.

NEXT YEAR'S ARRANGEMENTS.

As *Verbenas* and *Petunias* are now in full flower, notes of the best kinds should be made respecting their habit of growth, colour, &c., for their proper arrangement in the flower-beds next year.

VIOLETS

should receive attention to keep them clear of runners and weeds; and in order to get the crowns well matured they should have the surface soil well stirred, and if it be poor a good soaking of liquid manure should be given. Should red-spider appear, syringing the plants a few times with soapsuds, *Marie Louise* will now be yielding flowers, if they have received proper attention in the early stages. Preparations will soon be necessary to have *Violets* transferred to their winter quarters; which should be done before frost sets in, in order that they may be established; but it will be soon enough to remove them by the middle of September.

HERBACEOUS BORDERS.

These should be kept neat and tidy. The dead flower-spikes should be removed from all plants immediately they go out of flower unless it is intended to save the seed of any. Care must be taken not to cut away any of the foliage, or else the crowns will be considerably weakened, and the flowers of the next season will be correspondingly poor. Keep the seed-pods constantly picked off Sweet Peas, otherwise they will soon become exhausted. The same applies to *Dahlias*. Pansy cuttings may still be put in behind a wall, or in any moist shady situation. A hand light or rough box, with an old sash as a cover, will materially assist their rooting.

FLOWER PARTERRES.

The flower-beds will require more attention now the days shorten and the deposits of dew increase, to keep them free from decayed leaves and flowers. Where any of the occupants are becoming crowded, it is better to cut the interlacing shoots back, so as to secure a freer circulation of air amongst the plants. Such subjects as *Koniga variegata*, *Alternanthera*, *Cerastium*, *Stellaria*, *Mesembryanthemum*, &c., should be frequently pinched and clipped to keep the outlines of the designs well defined. Unless this be well attended to the designs of the beds will be obliterated. Keep any sub-tropicals requiring it securely fastened. Ordinary showers will fail to reach the roots of such subjects as *Nicotianas*, *Wigandias*, *Solanums*, *Ferandinias*, and other large leaved plants, therefore they must be occasionally examined to see that a sufficiency of moisture reaches the roots to maintain their leaf development in proper health. W. M. Baillie, Luton Hoop Gardens.

PLANTS AND THEIR CULTURE.

THE STOVE.

EUCHARIS AMAZONICA, valuable as it is at any time of the year, is particularly so during the last three months, when choice flowers are scarce. By dividing the stock of plants into several batches flowers may be obtained all through the year. If a number of the plants are taken out of the stove or other place where they have been growing, reducing the water at the roots, but not sufficient to make them lose their leaves, placing them in a lower temperature for about six weeks, they will throw up their flower-spikes during the season named.

Young plants of *Gardenia* and *Tabernaemontana* should now have their final shift, so as to get the pots well filled with roots before the autumn sets in. A pit where a growing temperature is kept up suits these best, and if they can have a bed of leaves over hot water, so that the pot can be plunged, so much the better. Should the foliage be infested with insects it must be cleaned by hand with soft-soap and water, as their tender foliage is injured by the use of insecticides.

Bougainvillea glabra should have all the weak shoots cleared away, as it is only the strong growths that flower. If kept well thinned out and a mulching of manure put on the top of the ball (when grown in pots) they may be kept in bloom for some time to come.

The main batch of *Genesera* and *Tydasas* will now be showing bloom; keep them under warm and moist conditions at the roots, but on no account let the foliage get wetted. *Bilbergias* are fine subjects for autumn blooming, namely *B. Moreliana* and *B. splendens*.

All roof climbers must be kept well thinned out and regulated, for if allowed to grow unrestrained they rob the occupants underneath of light. Reduce

the shading on the roofs of stoves and warm pits, as all growths should now be getting matured.

I do not advise the cool treatment which some adopt with stove plants, as it oftentimes causes them to start into fresh growth when placed in warmer houses later on, and then the plants cannot be depended on to produce much bloom the following season; but when all the occupants in this department have completed their growth the temperature and moisture should be reduced a little; this of itself will cause a partial rest.

PLANTS FOR THE DINNER-TABLE.

As far as possible, a calculation should be made of the number of these which are likely to be wanted and if there be not sufficient in stock of the various kinds which are not readily propagated and grown these should be procured at once. If the stock of *Crotons*, *Dracænas*, *Pandanus*, *Aralia*, &c., were put in as advised they will now be large enough for the purpose, but an addition to the stock of *Palms* and *Aralias* is always desirable. Any fine or new kinds of *Crotons* or *Dracænas* should be procured, so that whilst time remains they can be increased. *Tillandsia zebrina* and *T. muscica* are valuable for this purpose, and some of the *Nidulariums*, such as *splendens* and *fulgens*, which are of a compact character, and owing to the brilliancy of their leave, are well adapted for table plants. *A. Evans, Lytch Hill, Haslemere.*

FRUITS UNDER GLASS.

MELONS IN PITS AND FRAMES.

THE seasonable weather which we have had was favourable to the maturing of Melons in unheated pits and frames, in which, however, water must be applied very sparingly. In case the plants are likely to suffer for want of water at the roots—which seems doubtful, seeing that the latter can push freely into the dung or leaves underneath—supply it before mid-day, or sufficiently early in the afternoon to allow of the foliage getting dry before nightfall, otherwise mildew may be troublesome, and canker, too, would probably appear. Do not wait till it appears, but use as a preventive a mixture of quicklime and fresh soil around the collar of each plant, which will absorb any unnecessary moisture that may arise on or about the stems of the plants. Late plants will require the shoots to be stopped and thinned, the fruits being well exposed to the light by elevating them above the foliage. The pits and frames should be shut up soon after 2 o'clock P.M., slightly damping the plants overhead at the time on bright days. As soon as the fruits generally show signs of maturing, free circulation of air must be allowed, so as to give flavour and finish to them. Cover the pits and frames at night with mats.

MELONS IN HEATED PITS.

These should be attended to in the way of thinning, stopping, and tying of the shoots when necessary, stopping the shoots at two joints beyond the fruits, and put the supports to the latter in due time, so as to relieve the plants of their weight. Give liberal supplies of diluted tepid manure at the roots when necessary, until the fruits have attained to their full size, when clear water must be given. Damp the plants and house generally more or less every morning and afternoon according to the character of the weather and the stage of growth at which the plants may have arrived, maintaining a somewhat dry and airy atmosphere in houses in which the plants are in flower or the fruits approaching ripeness, and conditions the reverse of these where the plants are swelling off their fruits. Light the fires sufficiently early in the evening to prevent the temperature falling below 70° between sunset and sunrise. *H. W. Ward, Longford Castle.*

FRUIT TREES IN POTS: REPOTTING.

The fruit has long ago been gathered from the house that was forced early. The trees have also been repotted into larger pots, and they have rooted well into new potting soil. I have often described our system of potting, and need not go into any minute details except to say that when the trees get large, we take a chopper, and cut the hard ball of roots through just over the drainage, the ball itself is also reduced by the same process, an inch or so is cut off, and the tree returned into the same-sized

pot, from which it was taken out, the compost is rammed in very firmly all round.

AMERICAN PEACHES.

I have read Mr. Gilbert's remarks at p. 244, about the failure of the early American Peaches under glass. I presume his remarks do not apply to pot trees in the orchard-house, or even in an early Peach-house. We have grown Alexander and Amsden June Peaches every year since they were sold first in England, and have always had plenty of fruit. Our first fruits of them were gathered early in April this year, a month or six weeks before Early York was ready. We find Hix's Early also to be well adapted for orchard-house culture. I have not yet tried to grow Water-loo. I know nothing about Ketton Hall, but can take Mr. Gilbert's word that it is a "great Peach place." In that case nearly every variety of Peach and Nectarine ought to be made to bear fruit. The most troublesome variety known to me is *Exquisite*, and if I forget to look after it personally at setting time, it will most likely fail to bear fruit. It is necessary to take a fine hair-brush to collect pollen from any free-setting varieties to dust the stigmatic portions of the flowers of *Exquisite*; but we have never done this with Alexander or Amsden June. I fancy we have cropped them annually for ten or twelve years.

THE LATE-HOUSE.

The trees in this house are now in full bearing; but as soon as all the fruit is gathered, the trees requiring repotting will be seen to without any delay. Those not repotted will be top-dressed when the leaves fall. We fumigated the houses well early in the year, and aphid has not been troublesome; but a few have appeared recently, which had to be destroyed with tobacco powder or soapy water, as the house cannot be fumigated when the fruit is ripening.

ORANGE-HOUSE.

I have never tried the culture of this fruit planted out in borders, but would like to have the chance of planting and cultivating an Orange grove under glass. We have, however, long practised the more modest system of pot culture under glass. The trees will succeed well in any house where they get plenty of light and heat. The leaves are apt to become dirty owing to the scale, which will always attack them, and must be washed off periodically with soapy water. The trees ought to be now in quite a warm stove temperature, 70° at night, 85° to 90° by day; in that temperature the fruit will swell rapidly—indeed the *Tangierine*, which is the first to ripen its fruits, will come in during next month. When the fruits are ripe, or nearly so, the trees may be taken into a cooler house with a drier atmosphere, while the later fruiting varieties, such as *St. Michael's*, *Maltese Blood*, and the *Silver*, may still be pushed on in a moist warm atmosphere. The trees may be daily syringed until the fruit is nearly ripe. If it is not syringed when ripe, it will hang in good condition upon the trees for many weeks. Any trees with little or no fruit upon them, but which may be expected to fruit next year, should now be repotted, using good loam, a fourth part of decayed manure, and some crushed bones, with pieces of charcoal intermixed as large as Hazel nuts. *J. Douglas.*

HARDY FRUIT GARDEN.

RASPBERRIES.

If the old fruiting canes are not already removed, in order to give full light and air to the young ones of this year's growth, the work should be carried out as soon as possible. The old-fashioned system of tying five or six canes to one stake has wisely been abandoned for the better plan of tying them out singly to a permanent wire trellis, or a substitute formed with tar twine and stout wooden stakes placed at intervals along the rows, to which the tarred twine is tightly strained; the latter answers the purpose admirably, but, in the long run, is more expensive than the former. This is the time to tie the young shoots out, being careful not to break off the leaves. The young canes should be left full length at present, as it is preferable to shorten them back in the spring if necessary. When the tying is completed, the ground between the rows should be cleared from rubbish and weeds, afterwards the old mulching should be turned

under the surface soil, and when carrying out this work the fork should be driven under the soil, parallel to the surface, only to the depth of 3 or 4 inches, as this will raise sufficient soil to cover the mulching and at the same time break up the trodden surface. The same remarks apply to the treatment of the soil and mulching between the rows of bush fruits, Straw-berries, &c.

FRUIT GATHERING.

The gathering of Apples, Pears, Plums, Peaches, &c., will now, and for some time to come, claim daily attention, and when the fruit is dry and ready no opportunities should be lost to pick it when the weather is favourable. Early varieties of Pears, such as *Souvenir du Congrès*, *Colmar d'Éte*, *Beurré d'Amaldis*, will soon be ready. Peaches out-of-doors are a fine crop this year. When the fruit commences to ripen they should be regularly examined every morning when the fruit is dry, giving a gentle pull to those which indicate ripeness. The fruit is all the better for being kept in a cool fruit-room for two or three days prior to sending up for dessert. The best main crop varieties we have here out-of-doors are *Royal George*, *Dymond*, *Violette d'Éte*, *Noblesse*, *Grosse Mignonne*, *Téion de Venus*, and *Walbourn Admirable*. *G. H. Richards, Somerley, Kingswood.*

The Kitchen Garden.

WEEDS.

DURING the next month every opportunity should be taken of thoroughly cleaning and clearing the garden of weeds, hoeing and raking should therefore be persevered in, and as far as possible all weeds exterminated. One or two good cleanings now will go a long way in maintaining a clean and neat appearance and in keeping weeds in check during the autumn and winter months amongst growing crops, and where the use of the hoe is impracticable, hand weeding should be resorted to in removing big weeds before they seed, which should afterwards be taken to the rubbish heap and burnt.

WINTER STUFF.

The various quarters of Brussels Sprouts, Broccoli, Winter Greens, and the like, should also be gone over, and any small or discoloured leaves removed, and if not already done, the plants supported by having the soil drawn up to the stems.

ONIONS.

These, when the tops and necks begin to shrivel should be pulled up, and allowed to remain on the ground for a few days, meanwhile being turned over in order that they may become thoroughly ripe and firm, choosing a bright sunny day to store them. An airy dry store-room, with open shelves whereon to spread them thinly, would be the most suitable situation for the present, and until they can be assorted and cleaned. This is a favourable time for harvesting seeds of any description, and where not sufficiently ripe and matured at the time of gathering should be placed under conditions favourable for drying, but where the process would not be a too rapid one.

ENDIVE.

Plant out from the seed-beds sufficient to meet the demands throughout the winter. These plantings will supply the most useful crop, and will be available for lifting into frames, or for bleaching on the ground. More forward plants should be tied up or have slates placed over them whilst dry so as to become bleached for use. Where there is suitable accommodation a very small sowing can be made in a cold frame, to be afterwards transplanted into others for very late spring use.

LETTUCE.

Good provision should also be made of these, particularly of *Cos* varieties, by planting out now from the seed-beds all the most forward and strongest plants, and both *Endive* and *Lettuce* should be allowed warm sheltered borders and good ground.

TOMATOS.

Those on outside walls should now be ripening. Remove all surplus leaves and laterals, and expose the fruit as much as possible to the influence of the sun and air, and after this date remove all flower-spikes as they appear. The fruit also should be gathered with the stalks attached as soon as they show colour, and placed in a dry, warm, house or room to finish ripening. *John Austin, Wiley Cwty.*

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, Aug 30	Sale of Bulbs, at Stevens' Rooms. Great Sale of Bulbs, at Frotheroe & Morris' Rooms.
TUESDAY, Aug 31	Special Sale of Orchids in Flower, at Frotheroe & Morris' Rooms. Bath Horticultural Show (two days).
WEDNESDAY, Sept. 1	Sale of Bulbs, at Stevens' Rooms. Sale of Shrub and Greenhouse Plants, at Stevens' Rooms. Sale of Valuable Imported Orchids, at Stevens' Rooms. Great Sale of Bulbs, at Frotheroe & Morris' Rooms.
THURSDAY, Sept. 2	Sale of Greenhouse Plants, at The Floral Nurseries, Maidenhead, by Frotheroe & Morris. Fruit and Dahlia Show, Crystal Palace (two days).
FRIDAY, Sept. 3	Sale of Imported and Established Orchids, at Frotheroe & Morris' Rooms. Sale of Bulbs, at Stevens' Rooms.
SATURDAY, Sept. 4	Sale of Bulbs, at Frotheroe & Morris' Rooms.

AN interesting meeting was held in the Conference-room of the Colonial Exhibition on Tuesday last in connection with the first NATIONAL CO-OPERATIVE FLOWER SHOW, held in the Conservatory. As to the show we need not say much beyond what is stated in our report. In some particulars, as, for instance, Potatoes, it was good; in other points it is as well not to say more than that in all probability, when the effort is repeated another year, the results will be more satisfactory. Suffice it to say that the show was mainly got up by the Agricultural and Horticultural Association, that the competitors were members of the Association, and the produce was the result of seeds provided by that body. We prefer, on this occasion, to dwell rather on the general principles of the Association than on the exhibition, because they embody matters of the greatest importance, and which may confidently be expected in the future to grow and develop into something better.

The paper read by the Managing Director, Mr. EDWARD OWEN GREENING, before a Conference of Representatives of Co-operative Societies had for title, "How can our co-operative organisation be best utilised to promote a love of horticulture amongst our working people." In dealing with this subject Mr. GREENING was commendably clear and judiciously brief. This was shown by the great numbers of delegates from various parts of the country who contributed their share to the discussion. These gentlemen, unlike the reader of the paper, indulged in the stock sentiments as to the refining influence of flowers, and all the rest of it, which is no doubt quite true, but is a trifle stale. Practical suggestions would have been more appropriate than long-winded discussions on ethics and political economy. It may be that these latter matters are in a measure responsible for that tendency to elevate the social and recreative feature of the meeting above the business of the Association, and which was commented upon with some severity by some of the speakers. We must own, however, that if we had come up from Lancashire for a day at the Colonial, we might have felt disposed to eschew the business element, which can be transacted under less distracting circumstances, and under more favourable conditions elsewhere. But perhaps the remarks applied rather to other gatherings than to the one actually under consideration. In any case it is certain that much earnestness for the cause prevailed, and a strong desire for self-help as distinguished from officious patronage. All this is very encouraging, although we doubt not that a little judicious advice from competent persons as to what to do, and how to do it, would be acceptable.

Mr. GREENING'S suggestions for adding the pleasures and profits of a garden to every workman's house embraced the following points:—

1. An annual show, to be held by each society.
2. The provision of gardening requisites of all descriptions in small quantities, and at a reasonable cost to all the members.

3. The provision of instruction in botany and horticulture.

4. The organisation of excursions under competent leaders.

5. The provision of allotment gardens.

Adequately to discuss all these points would demand much more than the allotted time for discussion before the members were summoned to tea, and would, if treated in these columns, demand almost as many numbers of the *Gardeners' Chronicle* as there are items in the programme. Mr. GREENING, however, with much skill managed to compress what he had to say within the compass of an eight-page pamphlet.

Our own views as to local flower shows, what they do, and how sadly ineffective they are in promoting horticulture, have often been expressed; and we have repeatedly thrown out suggestions for their improvement, without, so far as we see, much result. The co-operators have evidently much common sense, and they may be trusted to develop their shows into something more useful than a show where there are nearly as many prizes as entries.

One way in which this development may find profitable scope is in carrying out the third item in the programme.

Co-operators, like other amateurs, lose much valuable time and waste much valuable force from ignorance of what to grow and how to grow it. Flower shows as at present organised only partially meet this defect, and indeed they are often misleading. It very often happens that the exhibits at a flower show, and which are supposed to be models, are by no means suitable examples for cottagers and co-operators.

Circumstances alter cases. What may be suitable for the duke's gardener or the wealthy amateur; what may comply with the fashion or the whims and caprice of the day, may be very unfit for the class of whom we are now speaking. What seems to be specially wanting in our rural districts are suitable schools of horticulture—and here we do not allude so much to organised systematic teaching of the rudiments of horticultural science as to practical demonstrations. Co-operators have not time to go to school; their days for sitting on a school form are past. To meet their requirements some such scheme as is carried out in Belgium and in France is required. In those countries competent instructors visit the rural districts at intervals, and give practical demonstrations in the garden of the best way to prune a fruit tree, to bud a Rose, graft an Apple, and so on. They explain the reason why, and point out the best methods of doing this, that, or the other operation, illustrating their remarks by actually performing the operation in view of the class. Such teachers, too, make known what sorts it is best to grow in particular localities, and facilitate the means of obtaining them. Prizes at flower shows consist, not of tea-pots or small money doles, but of approved seeds, tubers, cuttings, grafts of sorts well enough known to those who have access to great gardens, metropolitan flower shows, or to readers of the gardening Press, but which are all but unknown to those who do not enjoy these advantages. Some such scheme we commend to the co-operators for their consideration—no doubt with their keen business instincts they will see their way to improve upon it.

One other point we may allude to, and that is the little use that is made of the parcel post. Consumers in our great towns know to their cost at what price the very inferior supplies from the greengrocer are obtained, and we on our side know what beggarly returns the growers get from their produce. This season we have numerous complaints from the growers that Plums, for one instance, are scarcely worth picking, by the time the expenses are paid, the railway transit and the sellers' commission pro-

vided for, there is little or nothing left for the grower.

Surely here is a chance for the co-operators; let them by means of the parcel post bring themselves into direct communication with the consumer, and we doubt not that they will get a fair return for their trouble, and the consumer will get better value for his outlay. Of course, this would be done only on a very limited scale at first, but healthy things begin by being small, and grow by degrees. We commend the notion to Mr. GREENING and his fellow-co-operators as one eminently worthy of their consideration.

We must not extend our remarks at present, but we may at some other time make some further remarks on the other points in Mr. GREENING'S programme. In the meantime it is satisfactory to find the Royal Horticultural Society doing something towards recognising the diffusion of horticulture among a class for whom it has hitherto done but little.

JUST at this season the careful gardener who takes Time by the forelock, is busy taking notes of the various VEGETABLES he grows, with the idea of weeding out the inferior, and substituting some better kinds. And not infrequently the good and trustworthy, but not perhaps showy ones, are marked in the note-book to be wholly or partially discarded for some new candidate for place in the front rank of table vegetables. There is nothing but what is laudable in the pursuit of novelties, both on the part of those who raise them and those who purchase the newly launched commodities of the hybridiser and selector of new kinds, but it will happen, especially now that horticultural societies offer seductive prizes for large, in preference to the best productions of the gardener, that the new favourites do not excel, or indeed equal the old ones in sterling qualities; and nowhere does this fact seem to be so apparent as in varieties of PEAS. With the one exception amongst vegetables of Asparagus, as distinguished from roots, the Pea stands first as a table dish, and in most families it is found on the dinner-table from June till October, and in the preserved state during the winter months, but then only as an occasional dish—no method being known by which the delicate and evanescent flavour can be wholly preserved. Hence gardeners become greatly interested in anything connected with the universally liked vegetables, as proved by the amount of correspondence on the subject that reaches us from time to time during the season of Peas.

The gardeners may be roughly classed into lovers of big pods and of little pods; the first are mostly men who exhibit, and who, owing to the false standard fostered by judges at horticultural shows, attach all importance to size, be the other qualities what they may; the latter prefer the small podded, abundant cropping, and generally sweeter Peas, like Hare's Mammoth and its selection, Veitch's Perfection, and the many kinds of which these are near or distant relatives raised by Mr. LAXTON, Dr. MACLEAN, and others; and we cannot but think that in the course of time the sweet flavoured prolific "Marrowfats" will drive the coarser kinds out of all well ordered gardens.

Amongst other Peas than those named which possess all desirable good qualities we must not pass over Champion of England, Ne Plus Ultra (which is almost mildew-proof), Paradise Marrow, and the Early Advancer. Supreme is a good variety for a special purpose, for it may be sown to give its pods at about a certain date, after which time there is no succession of pods, and the ground may be cleared for another crop without delay—a great advantage to the market grower or the gardener with a limited area of garden ground.

Some persons like round Peas, and others

FIG. 55.—CHRYSANTHEMUM MAXIMUM: HARDY PERENNIAL: FLOWERS WHITE: POLLEN MAGNIFIED 320 DIAM. (SEE P. 274.)

again the wrinkled Marrow; but as the host does not select vegetables for himself alone, but for his family and his guests, and the majority of persons liking the latter the best, these varieties find the first place in the kitchen garden all over the country.

We have mentioned the fact of the large Peas finding favour with judges at shows, which will reasonably account for the estimation in which they are held by exhibitors; but we think that gardeners with small gardens should not grow them, for the rows will need more space between them than less tall, robust kinds; and if the rows should run singly at wide intervals across the quarters, the amount of space on either side must be large, and yet considerable shade will be thrown on the neighbouring crops that will be rather detrimental than otherwise.

In the matter of sowing Peas, there should be some little reform; we know that as a rule too many Peas are purchased, without there being adequate reason for so doing. It is no uncommon thing for half a peck of Peas to be sown in a drill of fifty yards, when, if the seed had been placed singly at 2 or 3-inch intervals, the plants would have been much stronger and far more prolific. There can only be two motives for thick seeding—those are, losses accruing from such depredators as mice and pheasants, and even here Pea-guards and traps would prove to be cheaper than the yearly outlay on large quantities of seed Peas. The points in good Pea culture may be summed up as consisting of deeply-trenched ground, if it is good enough to bear it; abundant manure, plenty of space, thin seeding, timely sticking to prevent wind twisting, and plentiful supplies of water or diluted liquid manure in hot weather, with mulchings of half decayed litter laid on for a breadth of 2 feet on each side of the row.

Every cook and housewife can cook Peas according to our island fashion, but the same Peas, if stewed in a small quantity of soup and eaten with or without meat, would be appetising and more nourishing, retaining the flavour fully, which with our method of boiling in a large quantity of water becomes in a measure dissipated.

— *CHRYSANTHEMUM MAXIMUM* (fig. 55, p. 273).—The Rev. C. WOLLEY DOD sends flowers of *Chrysanthemum* (*Leucanthemum*) *maximum* (DE CANDOLLE), a Pyrenean plant, often confounded in nurseries with *C. latifolium* (syn. *lacustre*), a taller and coarser plant, flowering later, and found wild in Portugal and near Naples. The stalk sent of *C. latifolium* was raised from seed sent from Portugal, where it grows to feet high. Perhaps all these varieties may belong to one botanical species. As much confusion exists in gardens we give a figure of *C. uliginosum* (fig. 51, p. 265), which is later in flower and has thinner, narrower, and more deeply toothed leaves. *C. maximum* and *C. lacustre*, we suspect, as our correspondent says, belong to one species. All are useful plants at this season for cutting or for general effect in the border.

— PROFESSOR REICHENBACH.—We are requested to state that the Professor's address for the next fortnight will be Herbarium, Royal Gardens, Kew.

— BOTANICAL DEPARTMENT, JAMAICA.—Pending the decision of the Local Legislative Council as to the future of the Department, Mr. J. HART has been appointed Acting Director.

— HORTICULTURAL INTERNATIONAL EXHIBITION, DRESDEN, MAY 7-14, 1887.—The committee of the above exhibition has sent out the official programme. It contains 392 different classes, with more than 1000 prizes, exceeding in amount 20,000 marks (= £1000), and is to be obtained free on application to the "Geschäftsbau der Internationale Gartenbau-Ausstellung, Dresden." His Majesty the King of SAXONY most graciously consented to become protector of this large enterprise; the Privy Councillor VON EINSIEDL, Director of the third department of the Royal Saxon

Ministry of the Interior, has been appointed Government Commissioner; and Dr. STUBEL, first burgomaster of Dresden, has accepted the post of honorary President of the committee. The grounds where the exhibition will take place are situated in the fine old park of the royal residence, close to the city, and in a most lovely and sheltered spot. Ten hectares were last spring prepared for exhibition purposes, the necessary buildings covering 6000 square metres (more than 70,000 square feet). The committee will do its utmost to supply foreign exhibitors with every possible facility, so as to secure to the exhibition an international character. It seems to have taken for its model the well-known quinquennial exhibitions at Ghent.

— PROLONGED VITALITY OF SEED.—From the gardens at Glen Grant we have received two joints of the pod of *Entada scandens*. The pods of this plant are very large and woody, each joint containing a single large seed. We have heard of these pods being made to serve the purpose of door knockers in the West Indies, and this use suggests another, viz., that they might be used as rattles to keep the birds off fruit trees. If we remember rightly, seeds of this plant have been washed up in a germinating condition on our western coast, but this is of minor importance as compared with the story told in the following letter:—

"The enclosed are two Beans from the joint of a pod 2 feet in length, and containing ten Beans. This pod was brought home from India over forty years ago by the late Dr. TAYLOR, of Elgin. Two months ago I put several of the Beans in a pot in our stove, and to my surprise two of them have germinated and thrown up stalks which are now over a foot in height. The Beans have not been preserved in any special way, so that under these circumstances and after so long a lapse of time it is strange to see vitality so strong in them. Perhaps you could tell me what is the name of the plant from which the enclosed has been taken off (*Glen Grant*.)"

— KEW.—The gardens are very beautiful just now, and as usual full of interest. The rockwork is such a success that it makes us long for a proper bog garden; the recesses that do duty for one at present are quite inadequate, and the tank hardly meets the requirements we have in view. The planting of the shrubby beds has been greatly improved of late, and beds of shrubs of interesting or striking character are inserted in place of masses of common Laurels and other tolerably well-known plants. Beds of variegated shrubs, of *Fuchsias* and of *Salvias* of various kinds, of *Helichrysums*, of *Phloxes*, and *Hydrangeas*, illustrate what we mean, and constitute a comparatively new feature of great interest. *Lilium auratum* in the *Rhododendron* beds adds variety to what at this season would be monotonous green beds. In the houses the massing system is introduced in a similar way—a clump of *Excacsoms*, or *Cockscombs*, or *Agapanthus*, or what not. This is better than a higgledy-piggledy arrangement, and allows of the character of the plant being better seen; but, for effect's sake, we should vote for a mixed system, in which a clump of some striking flower should rise from a mixed border as it were, rather than have a mass of one flower in juxtaposition with another group of some other flower. A bench of *Lilium speciosum* and blue *Agapanthus* intermingled is very beautiful just now in No. 4. What an eye for effect, too, had he, whoever he was, who lined the bed on one side of the Succulent-house with an edging of the extraordinary and curious *Streptocarpus Dunii*, each plant with a single very large boldly crumpled leaf, and a panicle of pale dull red flowers. We should never have thought of growing a *Streptocarpus* in such a position, but the effect is unique. The pale cream-coloured *Crocus vallicola* may be noted in the *Crocus* bed. It looks as *insolite* in its way as the *Streptocarpus*. A bed of species of *Nicotiana*, opposite No. 2 Museum, should attract the attention of those enthusiasts who are looking to grow Tobacco in this country; the different periods at which the leaves ripen off is especially noteworthy, from this point of view.

— MR. BULL'S ORCHIDS.—Although the special exhibition which Mr. BULL holds for so many weeks during the summer has now closed, the visitor may still find much to interest him; indeed, we are disposed to think that the real Orchid lover will find a visit more satisfactory now when the number

of plants in bloom is greater. At any rate, he can study the plants more effectively and more at his ease. Those who want something gorgeous to look at may still find *Cattleya Dowiana* and *C. speciosa Mendellii*, *Lelia Amanda*; *Oncidium dasystyle*, with its bee-like lip, forces itself upon the visitor; *Maxillaria venusta*, *Oncidium Papilio*, and its allies; *Dendrobium bigibbum*, *Catasetums* of various kinds, *Miltonias*, *Epidendrum prismatocarpum*, *Renanthera coccinea*, small plants full of flower, and various others, are still to be seen, including the beautiful *Cypripedium Spicerianum*, which is blooming out of season. Where such large quantities are grown some will be sure to be out of season, but none the less welcome. For the lover of curiosities Mr. BULL has a treat in store in the shape of a new *Aristolochia*, closely allied to *A. eriantha*, but differing from that species. In form it is grotesque, but the distribution of colour is singularly beautiful. We hope shortly to have an opportunity of figuring this species, which has but one drawback—the smell, not of the flower, but of the leaves.

— *PASSIFLORA VITIFOLIA*.—If this *Passiflora* could be made to bloom with the freedom of *P. racemosa* or *P. kermesina* it would simply be magnificent, but rather overpowering if the flowers were numerous, owing to the intensity of colour, which is a brilliant or vermilion-scarlet. This applies to both sepals, petals, and corona, with the exception perhaps of the keel or excurrent midrib of the sepals, which is often or usually green. The flowers are axillary, solitary, and several inches in diameter, resembling a *Tacsonia* in general aspect, and is often called *Tacsonia vitifolia* or *T. Buchanani*. The elongated tube, however, by which *Tacsonia* is distinguished generically from *Passiflora* is here absent. The leaves are ample and deeply three-lobed, with indications of two small lateral lobes near the base in strong specimens, and irregularly toothed, with much broader and ovate segments, very different from those of the *Tacsonia* Van Volckemii type, to which the flowers bear a superficial resemblance. There is a good representation of the species in the *Floral Magazine*, n.s., 317, and a flowering specimen may be seen in the Palm-house at Kew trained to wires under the curvilinear roof. It may be cultivated in a large pot, using light rich loam and fibrous peat, with sufficient silver or river sand to ensure sufficient porosity; but like many or most other species it gives most satisfaction when planted out as at Kew. The climbing stems attain great length, and consequently require more room for root extension than could be conveniently given them in a pot. The plant is a native of Panama, and the northern parts of South America.

— EXPERIMENTAL TOBACCO CULTURE.—On some ground rented by MESSRS. CARTER & CO., at Plaistow in Kent, a number of varieties of the Tobacco plant are now undergoing a course of trial, so as to ascertain the varieties best suited to our climate. The ground is so far suited to the growth of the plant it being well sheltered, but although its area does not exceed three-quarters of an acre, there appears to be considerable diversity in its fertility, as is shown by the varying heights and strength of the plants; and the lowest part of the ground is liable to be flooded by water from a neighbouring ditch. These drawbacks could be avoided by deep digging after an even distribution of homogeneous well-rotted manure, and by other obvious changes. The sorts grown are Havana, Spanish Seed-Leaf, Florida, Yellow Pryor, Hester Virginia, Pennsylvania, One Sucker, Kentucky, Virginian, Big Frederick, Maryland Broadleaf, Island Broadleaf, White Burley, White Stem, Yellow Oroonoo, Connecticut, and Glasner. The most promising Tobaccos are those which are long jointed and broad-leaved. These carry their foliage clear of the soil, and are in consequence not disfigured by dirt or injured by worms and slugs; the air gets better among them than in the case with the short compact-habited sorts whose leaves, as in the case of Cann's Seed-Leaf, lie on the ground or nearly so. Glasner, Connecticut, Pennsylvania, and White Burley are each more or less, so far as could be seen now, of this close dwarf habit. The other kinds differ from these in being, as we have said, of an ascending habit, with long intervals between the leaves. Some have slender foliage, pendulous at the tips; others support the leaf horizontally, or nearly so; and in scarcely any of them are the various hues of green alike. The plants are now

growing fast, and if the weather continues warm, without rain, great progress will be made before we get frost in that part of the country. The method of cultivation adopted is that generally advocated by men of experience in the United States of America, the plants being set out on slight hillocks standing 3 feet apart in the row, and 4 feet between the rows, the greater space affording means of getting amongst the plants with the cultivator in the early stages, and with the hoe later. Topping the plants as they show the flower-buds and have developed nine leaves, without reckoning the bottom pair, and constantly removing laterals, requires the constant attention of the man in charge of the crop. If it should be found to answer, and our Government fix an Excise tax on each plant, as is done in Belgium, it would prove a source of revenue to our small farmers and cottagers, as the profits per acre are considerably higher than those from corn, &c.

— A BI-GENERIC HYBRID.—We know nothing of Bulgarian atrocities or other news of the week that will for a moment compare with the interest attaching to Messrs. VEITCH'S hybrid between Sophronitis and Cattleya, described by Professor REICHENBACH at p. 265. The result, as will be seen, is not a Cattleya nor a Sophronitis, but a *Lelia*! We are confident that Mr. SEBEN has accomplished a revolution in botanical science which in its possibilities and far-reaching significance puts Home Rule, or any ephemeral accident of that kind, quite in the shade. If politicians cannot see it in the same light, that is not our fault. They deal with the things of the day—this is one of the "external verities," as CARLYLE would say.

— SWISS SOCIETY OF NATURAL SCIENCE.—The meeting of this society, the oldest of its kind holding meetings in different towns, has lately been held in Geneva. Among other papers read was one by Dr. GILBERT on "Aggregate Temperatures." This was the more appropriate, as the veteran botanist of Geneva, M. ALPHONSE DE CANDOLLE, was the first to draw the distinction between what may be called useless temperatures and those which are useful. No temperature lower than 32° Fahr. can be considered useful to plants, and in most cases a considerably higher degree is necessary, hence in applying meteorological records to practical purposes it is necessary to eliminate all those lower than a certain degree as useless. It has been ascertained that for each plant a certain aggregate amount of heat is necessary—so much for the production of foliage, so much more for the production of flower and seed, and so on. Dr. GILBERT, therefore, availed himself of the unique series of observations at Rothamsted to prepare a paper, entitled "Some Illustrations of the Connection between Aggregate Temperature and Agricultural Produce." The paper contained a summary of the records of Rothamsted and of the Meteorological Office, comparing the results with others of a like character in different countries. M. ALPHONSE DE CANDOLLE spoke at length on the subject, and we may shortly hope to be able to publish an abstract of this paper of such vast interest to cultivators.

— WHAT CULTIVATION DOES.—Mr. BARR furnishes us a good illustration of this in the shape of some root-stocks of the lovely *Anemone fulgens*. Wild specimens before us vary from 1 inch to 2½ inches in length, with an average diameter of about half an inch. Cultivated specimens measure 4 inches in length by 2½ or 3 inches in width, and are divided into numerous stout, sturdy branches, giving abundant promise for the future. Tourists and plant lovers should remember this, and not uproot the native plants, but collect the seed and grow it on, or get the nurseryman to do it for them.

— CHANGE OF ADDRESS.—Mr. ALEXANDER CREWE, late Manager to Messrs. VICARS, COLLYER & Co., Leicester, has been appointed to a similar post in the establishment of Mr. R. H. VERTEGANS, Chad Valley Nurseries, Birmingham.

— PUBLICATIONS RECEIVED.—*Review of Trade by the Development of India*. By W. BIRKMYRE. (Agricultural Department Privy Council Office.)—*The Motherly Silkworm: a Manual of Instructions in Silk Culture*. By C. V. RILEY, M.A., Ph.D. (U.S.A. Department of Agriculture.)—*Report of the Entomologist* (C. V. RILEY, M.A., Ph.D.) for the Year 1886. (U.S.A. Department of Agriculture).

GRAFTED AND BUDDED TREES.

ANY such must now be examined, the bandages loosened or renewed, and shoots growing below the junction be rubbed off. Hildes, Thorns, and Chestnuts may still be worked, but the sooner the buds are inserted the more rapid and strong the young shoots will appear.

NEW PLANTATIONS.

All grounds intended for planting will now require to be enclosed, drained if necessary, cleared of rank herbage—Gorse, Broom, rough grass, and brush—and pitted, where such is found most suitable for the future welfare of the young plants.

Early pitting should always be the rule, and particularly where the soil is stiff, as the upturned earth is thus exposed to the influences of the early frosts, which make it well fitted for the reception of the plants. In removing Gorse and Broom from land that is to be planted, grubbing will be found to be the best way, removing every root and twig, or else they will prove a source of danger by fostering insects and fungoid pests, to the detriment of the trees. Draining should be performed as early as possible in the present month, so that by planting time the ground may be in a workable condition.

PINE BEETLES.

Keep a sharp outlook amongst newly planted Firs and Pines for beetles and caterpillars, as this is their busy time. *Pinus Lurida* was thought to be exempt from the attacks of the Pine-beetle, but this, I am sorry to say, is not the case, for some 12,000 plants, put in at about 1000 feet altitude, on this estate, have suffered severely. For identification of the insects, and the best methods of exterminating the same, we would strongly advise foresters or others in charge of woodlands to apply direct to Miss Ormerod, as too much of the information usually appearing under this head is very faulty.

DRAINS.

Drains will be apt to get choked up by Nettles and other weeds, the growth of which has been extraordinary during the past month, so that it will be found advisable to pay extra attention to this matter. This may be considered as the best season for clearing all woodland ditches, mouths of closed drains, culverts, &c.

HEDGES AND FENCES.

These may now be trimmed closely in, the soil along their sides cleared of weeds, and any branches of trees which overshadow them cut back. Overhanging branches are always injurious to live fences of all kinds, and should be cut back at least once every year, and no better time for such will be found than when the hedges are receiving their annual trimming during the summer months. Prepare ground for the reception of Quicks in autumn by deeply digging or trenching it over, poor soils receiving a good coating of decayed farmyard manure before being dug. Plant the Quicks during favourable weather in late autumn, or before Christmas, as the Thorn being one of our earliest plants to start into growth must be got in early, so as to have a fair chance of becoming established during the following year. More than at any other season of the year fences generally will require attention, so that the trespassing of farm stock to the woods may be prevented. Cattle are now so tormented by flies that the cool woodland is a pleasant resort, and anything but a fence of the best material and construction will be useless for the purpose. During dry weather cart materials for the erection of new fences, but particularly those on high hilly grounds, as the cost of transit is considerably lessened at such a time.

Tree guards will likewise require an occasional examination to see that all is secure. Upright stakes nailed to a circular hoop at top, we find the best both for appearance and efficiency, hurdles taking up too much room, and wire netting placed around the stems being both dangerous and risky, and more especially where valuable horses are kept, their shoes getting entangled in the wire. Rabbit-proof nettings and the stakes and ties of last year's planted Conifers should also be examined and repairs done where such are found necessary.

RIDES AND DRIVES.

Trim and mow wood rides and shooting paths, and prune park and hedgerow trees, removing all ill-balanced and drooping branches, as well as dead twigs and limbs. The Portugal Laurel and Laurastinus were, in this and other districts, severely cut by the unseasonable frosts, so that a little trouble in the way of pruning will, for the sake of neatness, have to be taken.

GENERAL WORK.

Work in the woodlands, including thinning, removing of timber and firewood, pruning of dead branches from recently thinned Oak plantations, and removing of superfluous shoots from coppice stools, should be pushed forward, and finished early in the month; indeed such work should precede the harvest, so that the game, on being driven into the woods as the crops are cut down, may not be disturbed by the operation. Collect branches alongside the drives and roads in the woods, and have these made into faggots and removed.

About the latter end of the month is the best time to transplant all evergreens, but it is likewise well to choose dull damp weather for the work. By thus making an early start the plants will be able to lay hold of the ground while the temperature is still high and get established before winter sets in—a point much in their favour, for if they come through that season unharmed they are much better prepared to withstand the east winds and partial droughts from which spring planted evergreens usually suffer so much.

Rarely have we seen such a heavy crop of cones as is at present visible on the various species of Abies, Picea, Pinus, Cedrus, and Cupressus. The branches of *A. nobilis* are, in the majority of cases, borne down with the unusual number of large sized cones, which may likewise be said in a minor degree of *A. Nordmanniana*, *A. cephalonica*, and *A. Webbiana*. How soon the pretty little cones of *P. Menziesii* assume a brown and ripened tinge!—indeed, a month ago, when numerous others on allied species were hardly fully formed, those on this distinct and desirable Conifer were glistening in the sunlight. Perhaps never before have such a number of our forest trees produced a second growth as during the present peculiar season, and certainly seldom so early numbers of the Oak and Beech during the final weeks of July. It is to be hoped that we shall have warm dry weather, so as to ripen these ill-timed though highly ornamental growths. *A. D. Webster, Fenchyn Castle, North Wales.*

Notices of Books.

Golden Feather. By the Author of *Mehillia* John Herring, &c.

This is one of the series of penny novelettes lately projected by the Society for Promoting Christian Knowledge, with a view to improve the taste in fiction of the masses. Mr. Daring-Gould, it seems to us, has produced in *Golden Feather* an ideal of what such a tale should be. To say it is equal to the general run of 31s. 6d. three volume novels, considering their invertebrate morality, dull prolixity, and sameness, would be poor praise. As the hero is a gardener, and the greater number of the incidents move in a horticultural atmosphere, it should prove of great interest to a number of our readers. The story opens with an exemplified definition of the Essex phrase "tiffing toilly." And at the end of the first chapter we get to know what "toit tiffing" may mean in the life of a family. A contrast is next drawn by a description of the happy home of a small seedsman, who had a vast tenderness for Balsams. This seedsman, Deval, by name, has two sons. The older, a scapegrace, has no fondness for anything in his father's nursery except the Tobacco, which he purloins for his own use. These thefts lead to a quarrel between father and son. The old man never could see the *raison d'être* of smoking folks, he was wont to declare, had no greenery in their insides. The eldest son, who was really a graceless scamp, finally leaves the paternal roof and goes to sea. A report soon transpires that he has been drowned—much to the sorrow of the mother, who loves her profligate elder son far more than the quiet, genuine younger brother. Matters, again, do not go so smoothly as possible between the father and this son. He had an ambition above Balsams. "He

would rather be a chimney-sweep than stick at Petunias," which flower his father had suggested as an alternative to Balsams; he had made up his mind to be a Rose grower, and a Rose grower he would be.

The tale from beginning to end, where the younger boy comes over from his Rose nursery at Chantilly, and wins the chief prizes at an International Rose Show at Colchester, and at the same the sweet type of womanhood drawn in the person of "Golden Feather," has an unflagging interest. Mr. Baring-Gould shows an intimate knowledge of gardening life which one would hardly expect from the weird vein he has been working in his other romances. Besides the hero and heroine all the other characters are good. Particularly well drawn are the occupants of the miserable household from which the blameless "Golden Feather" emerges. The mother is one of those unhappy women "who are always in a mess, and the harder she worked the greater the mess into which she reduced the house." Her description of the uses of a petticoat is worth quoting. "You see what a blessed mercy a petticoat is to a mother of a family; it's like a towel, and a duster, and a handkerchief, and a glasscloth, and a brush, and a score of other things combined; if you have't what you want handy, you have only to whip up the side of your gown, and you can use the petticoat to clean a plate, or wipe the table, or wash a face, or when Malonic has been a-banging me about in his playful ways, I can wipe my eyes with it, or you can try an iron on it, or use it as a kettle-holder. You let down your gown and nobody's the wiser. It's just—just like the drop-scene of a theatre."

Another good point is that there is no moral drawn at the end, but the tale cannot avoid teaching a good lesson, and ought to be known in every poor household.

Florists' Flowers.

CYCLAMEN PERSICUM.

The valuable note by Mr. James Douglas at p. 246 illustrates in the most direct manner the familiar but much abused truth, that we must look to Dame Nature as our teacher when our ambition is to succeed in plant growing. It will be good for young gardeners to read the note a second time, and men who have given up the habit of being "young" may in many cases certainly derive something from it. The cultivation of the Persian Cyclamen is one of the most modern of arts, as the books will show to those who know nothing of exhibitions or markets. It was the custom to "dry off" the corms when the flowering was over, and the plant was always hovering between life and death until within some five-and-twenty years of this time, since when the teachings of Nature have had some amount of respect, and the Cyclamen has become a truly wonderful thing. In the year 1858 I made a venture in this business, following the stupid old routine of drying off. It is said that "dead men tell no tales," but that is a grave mistake, for they tell tales of the doctors, the heart-breakers, and the wretches who make promises they do not intend to keep. My dead Cyclamens used to say to me in words I could actually hear, "This drying-off is a deadly business, give it up." And I gave it up, and acted on the theory of continuous growth as a feature of the life-history of this lovely plant. I did the same with Calla (Richardia) ethiopia, and had the generous aid of the *Gardeners' Chronicle* in dispelling the delusion that is embodied in the drying-off that beauty which no more needs such severe treatment than Mont Blanc requires whitewashing. The improved cultivation of the Persian Cyclamen has acquired historical importance, for it illustrates the whole theory of horticultural progress in the past half century. The life of the modern garden may be said to be coeval with that of horticultural journalism, dating, say, from the time of the Reform Bill, 1832, when Loudon was in full swing and railroads were in their procreant career. Yes, I soon found that drying-off was a clever method of compelling the dying off of my pets, and I adopted the plan of continuous growing, subject to a sort of tidal rise and fall, the low tide time in this case meaning moderate moisture, and a temperature just low enough to favour rest. I should

much like to establish the date, if only approximately, of the origin of Cyclamen culture according to modern ideas. It needed but a few striking facts and agreeable reflections thereupon to satisfy me that to dry off a Cyclamen corm was to make a bad mummy of it. I want to supplement the valuable paper of Mr. Douglas by saying that tidal growth is the secret of success, and low tide should always mean that moisture is still requisite—what is understood as desiccation being a desecration of this delicate gift of the All-giver. In the *Garden Oracle* for 1863 I published what I then believed, and do still believe, was and is the best short essay ever penned on the subject; but if somebody will show me a better of an earlier date I will be in haste to cry "Peccavi." And here is the substance of it, which possibly is a good code still for success in Cyclamen culture. A stock of useful plants may be raised in six months by a very simple course of action. Prepare a number of shallow boxes 3 inches deep, or, lacking these, use shallow seed-pans. Over the corks spread tough peat in half-inch lumps, and fill up with a mixture of equal parts peat, turfy loam, leaf-mould, and sharp sand. In January sow the seeds singly 3 inches apart every way, and put the boxes or pans on a tank or bank bed in a moist temperature of 60° Fahr. As soon as the seedlings show, look over with sharp eyes and insert a seed wherever one has missed. Keep them going at 60° until March, then raise the heat to 70°, and be careful to maintain a rather high degree of atmospheric humidity while supplying water to the roots with regularity and freedom. By the first week in June you ought to be in possession of a fine lot of growing plants, and it will be time to promote the formation of the flowers. To do this put them under the stage, or remove to a cool greenhouse, and at the end of the month remove again to a frame or pit. From the time of removal from the growing stage they must have less and less water, but they must never be dry, for drought at any time is deadly to the Cyclamen. The month of July should see this chapter of the cultivation completed, and the routine for securing the crowning delight being nearly the same as for producing the plants in the first instance. *Shirley Hibberd, Ken.*

A REVISION OF THE GENUS PHALENOPSIS.

(Continued from p. 210.)

Section II. PROBOSCIDIODES.—Sepals and petals as in Euphalenopsis, lip without apical appendages; column with a long proboscis-like rostellum, and singularly like an elephant's head and trunk—hence the name.

8. *P. Lewisii*, Rehb. l. in *Bot. Zeit.*, 1862, p. 214; *Gard. Chron.*, 1862, p. 979; *Proc. Roy. Hort. Soc.*, ii., p. 726; *Bot. Mag.*, t. 5354; Warner, *Sel. Orch.*, ser. 2, t. 15; Rehb. l., *Xen. Orch.*, ii., t. 151; *Fl. des Serres*, t. 1910.—A handsome species, differing from all others by the remarkable rostellum, which resembles an elephant's trunk in appearance. It is also remarkable for its deciduous habit. Sepals and petals rosy-blush; lip yellow at base and purple in front. Native of Borneo and Moulmein.

Section III. ESMERALDA, Rehb. f.—Petals not or scarcely broader than sepals; lip without apical appendages, but with a pair of slender linear appendages on the stalk of the lip below the lateral lobes; the latter character alone separating it from the following section. Two species from Burma and Cochin China.

9. *P. Esmeralda*, Rehb. l. in *Gard. Chron.*, n.s., ii., p. 582; *Rev. Hort.*, 1877, t. 107; *Fl. Mag.*, n.s., t. 358.—A pretty little species, with flowers in elongated racemes, amethyst coloured, and about the size of *P. rosea*. Some varieties have pale coloured flowers. Native of Cochin China.

10. *P. antonizera*, Rehb. f. in *Gard. Chron.*, n.s., xi., p. 298, and *Willd.*, p. 520.—A pretty species, somewhat resembling the preceding. Spikes about 2 feet long. Flowers light rose-coloured; front lobe of lip amethyst coloured, side lobes striped with orange-red. Native of Burma.

Section IV. STAURORHLOTIS, Benth. and Hook. f.—Petals not or scarcely broader than sepals; lip variously shaped, but without the apical appendages of the section Euphalenopsis, or the basal appendages of the section Esmeralda. The first three species have the apex of the lip notched, but do not otherwise differ. It is by far the largest section of the genus, the species numbering twenty-four. They are spread over the islands of the Indian Archipelago, with two or three species in continental India.

11. *P. amethystina*, Rehb. l. in *Gard. Chron.*, 1865, p. 410; 1870, p. 1731, with ill.—A curious little species, with cuneate-oblong leaves, and small cream-coloured flowers, with an amethyst lip. This latter is shortly notched at the apex. The locality is given as Sondaic Islands, so is possibly Java or Sumatra.

12. *P. Stoborlana*, Rehb. l. in *Gard. Chron.*, n.s., viii., p. 392.—Described as "a curious little plant, in the way of *P. amethystina*, with very uncommon colours." The sepals and petals are apple-green, changing to cinnamon-green; lip amethyst coloured, changing to cinnamon-red; lateral lobes of lip marked with yellow and white. Native country not stated.

13. *P. Hebe*, Rehb. l., *Hamb. Gartenz.*, 1862, p. 35; *Xen. Orch.*, ii., p. 5, t. 156; *P. bella*, Teijsm and Binn. in *Batav. Nat. Tijdschr.*, xvii. (reprint, p. 17).—A small flowered species, probably not now in cultivation. The flowers are white with some purple stripes on the lip, and borne in short spikes. The front lobe of the lip is very short and again divided into two rounded lobes. Native of Java.

14. *P. rosea*, Lindl. in *Gard. Chron.*, 1848, p. 671, with fig.; *Bot. Mag.*, t. 5212; *Past. Fl. Gard.*, ii., p. 72; *Fl. des Serres*, t. 1645.—*P. equestris*, Reich. l., in *Linnæus*, xxii., p. 864.—*Staurorhlotis equestris*, Schauer, *Act. Leop.*, xiv., Suppl. 1, p. 432.—A very pretty species, the rose-coloured flowers being borne in branched panicles. Native of the Philippines.

15. *P. leucaspis*, Rehb. f. in *Gard. Chron.*, n.s., xv., p. 638.—Said to be a distinct variety, having a white callus with brown dots, and no brown on the base of the lip. It sometimes has a yellowish hue.

15. *P. deltoidea*, Rehb. f. in *Bonpl.*, 1854, p. 93; *Hamb. Gartenz.*, 1860, p. 116.—Allied to *P. rosea*, but more slender and with smaller flowers. Native of Java, and probably not in cultivation.

16. *P. Parishi*, Rehb. l. in *Gard. Chron.*, 1865, p. 410; *Xen. Orch.*, ii., p. 144, t. 156; *Bot. Mag.*, t. 5815.—A tiny little gem, with short flower-spikes of white or cream-coloured flowers with a purple lip. This organ bears a curious fringe on its disc, and moves freely backwards and forwards from its jointed attachment. Native of Burma and Moulmein.

Var. *Lobbi*, Rehb. l. in *Ref. Bot.*, t. 85.—Differs from the type in the lip having two broad chestnut bands alternating with three narrow white bands. Native of the Eastern Himalaya.

17. *P. pallens*, Rehb. l. in *Walp. Journ.*, iv., p. 92.—*Trichoglossis pallens*, Lindl. in *Ann. Hort. Soc.*, v., p. 34; *Past. Fl. Gard.*, i., p. 15.—*Staurorhlotis pallens*, Rehb. l. in *Hamb. Gartenz.*, 1860, p. 117.—*P. rosea* is a curious little species described from a plant which flowered at Chatsworth in 1850, but which seems to have since been lost sight of. Flowers nearly 2 inches in diameter, pale delicate green with a white lip; the latter organ oblong with a white shaggy crest.

18. *P. Reichenbachiana*, Rehb. f. and Sander in *Gen. Chron.*, n.s., xviii., p. 586.—Closely allied to *P. pallens*. The flowers are borne in racemes; sepals and petals whitish-green with brown markings; side lobes of lip orange and white, central lobe mauve-blue. Native country not stated.

19. *P. Desvriesiana*, Rehb. f. in *Hamb. Gartenz.*, 1860, p. 116.—Described from a drawing made by the Dutch botanist and collector, De Vries. The description is very imperfect, and points to an affinity with *P. cornu-cervi*, but differing in the front lobe of the lip, which is said to be narrowly obovate. Native of Java, but apparently only known from the drawing.

20. *P. cornu-cervi*, Bl. and Rehb. l. in *Hamb. Gartenz.*, 1860, p. 116.—*Polychilos cornu-cervi*, Breda, *Orch. Juv.*, t. i.; *Bot. Mag.*, t. 5570.—An interesting plant on account of its curiously flattened rachis. The flowers are smaller than those of *P. Luddemanni*, the sepals and petals greenish-yellow with transverse brown bars, and the lip creamy-white. The central lobe of the lip is short and much dilated, the front edge being somewhat crescent-shaped. Native of Java and Sumatra.

21. *P. Anthorina*, Rehb. f. in *Bot. Zeit.*, 1864, p. 293.—Described from a dried specimen, and probably not yet in cultivation. It is allied to the preceding, but differing somewhat in the shape of the lip, the front lobe of which is described as retrue with an apiculus. The flowers are marked with red spots on a yellow ground. Native of Borneo.

22. *P. Mannii*, Rehb. l. in *Gard. Chron.*, 1871, p. 902.—A pretty species, with branched racemes of several flowers; the sepals and petals are yellow with cinnamon-brown blotches, the lip white with purple markings. It is allied to *P. cornu-cervi*, and was discovered by Gustav Mann in Assam.

23. *P. Bosatii*, Rehb. l. in *Gard. Chron.*, n.s., xiv., p. 274.—A pretty species, closely allied to the preceding. The sepals and petals are sulphur-coloured, the former barred and blotched with brown, the latter with three longitudinal stripes of the same colour; lip white, front lobe crescent-shaped with blunt angles and a central tubercle, lateral lobes erect, disc with a short, bicuspidate

yellow lobe, with a mauve and white keel in front, introduced by Mr. Boxall from the Philippines.

24. *P. violacea*, Teijsm. et Binn., in *Batav. Nat. Tijdschr.* xxiv. (reprint, p. 16); *Fl. Mag.*, n.s., t. 312; *Gard. Chron.*, n.s., xvi., p. 145, fig. 32; *Orch. Alb.*, t. 182.—*Stauntonia violacea*, Rehb. l., in *Humb. Gartenz.*, 1862, p. 34.—A very handsome species, with erect spikes of large violet flowers, opening a few at a time, and remaining in perfection for a considerable period. The lip is thick and fleshy, the central lobe very deep purple, the side lobes erect, small, deep purple and orange colour. Native of Sumatra. The following varieties have been described:—

Var. *Murioniana*, Rehb. f., in *Gard. Chron.*, n.s., x., p. 234.—Flowers lemon-coloured, with purplish bars at the base of the lateral sepals; the base of the same and the middle part of the lip marked with the colour.

Var. *Schroederiana*, Rehb. f., in *Gard. Chron.*, n.s., xviii., p. 680; *Fl. and Pomol.*, 1880, p. 140.—A fine variety, said to differ from the type in its larger and more brilliantly coloured flowers.

Var. *Bowringiana*, Rehb. f., in *Gard. Chron.*, n.s., xvii., p. 262.—A handsome variety, with pure light yellow flowers with purple markings at the base of the sepals and petals.

Var. *Jellina*, Rehb. f., in *Gard. Chron.*, n.s., xvii., p. 262.—Much resembling the variety *Bowringiana*, but without the blotch at the base of the sepals and petals.

Var. *punctata*, Rehb. f., in *Gard. Chron.*, n.s., xvii., p. 262.—Sepals and petals light yellow, white at the base, with a disc of small purple spots on the inside of the lateral sepals.

Var. *chloracea*, Rehb. f., in *Gard. Chron.*, n.s., xvii., p. 262.—White, with purple disc on the lateral sepals inside the inner margin, and green tips to the sepals and petals.

25. *P. Valentini*, Rehb. l., in *Gard. Chron.*, n.s., xv., p. 262.—A very pretty species, much in the way of *P. violacea*, but with smaller flowers; sepals and petals purple, or the petals white at base, with a few purple bands; lip mauve, white and yellow, much like the preceding species. Native country not stated.

26. *P. maculata*, Rehb. l., in *Gard. Chron.*, n.s., xvi., p. 134.—A beautiful small-flowered species, with pallid sepals and petals with a few purple-brown blotches. Lip with a fleshy semi-terete purple central lobe, a yellow callus, purple anterior border, and numerous small spots. Native of Borneo.

27. *P. Mariei*, Burbidge, in War. and Will., *Orch. Alb.*, t. 80. (See also note under, t. 87).—A handsome species, with distichous, drooping, oblong, dark green leaves, and pendulous racemes of moderate-sized flowers. Sepals and petals white, transversely blotched with chocolate-red, and a magenta-purple spot or two at the base. Lip rose-purple, with white edges, central lobe flat, and without hairs. Discovered in Borneo by Mr. Burbidge, and named in honour of that gentleman's wife.

28. *P. fuscata*, Rehb. l., in *Gard. Chron.*, n.s., ii., p. 6.—A handsome species in the way of *P. sumatrana*, but with smaller flowers. Flowers fleshy, light yellow, barred and mottled with brown; in the front part of the lip purple, with an orange crest. Native of the Malayan peninsula.

29. *P. fasciata*, Rehb. l., in *Gard. Chron.*, n.s., xviii., p. 134.—Somewhat resembling *P. sumatrana* in the shape of the light yellow sepals and petals, which have numerous cinnamon bars; lip sulphur colour, except the central lobe, the front part of which is light purple and the base orange; without cushion of hairs. Leaves and roots like *P. Luddemanniana*. Native of the Philippines.

30. *P. Luddemanniana*, Rehb. f., in Mohl and Schl., *Bot. Zeit.*, 1865, p. 145; *Fl. des Serres*, t. 1636; *Bot. Mag.*, t. 5523; *Rev. Hort.*, 1872, t. 390.—A very handsome species, with short spikes of flowers. Sepals and petals transversely barred with amethyst-purple on a light ground, the front part of the lip violet, and bearing a number of erect hairs. Native of the Philippines. The following varieties have been described:—

Var. *pulehra*, Rehb. l., in *Gard. Chron.*, n.s., iv., p. 36.—Described as having flowers of a beautiful portwine colour, with the lower parts of the sepals, petals, and lip of a shining amethyst-blue.

Var. *delicata*, Rehb. l., in *Gard. Chron.*, 1865, p. 434.—A pretty variety, with narrow stripes of cinnamon on a light ground, the lower half of the segments barred with amethyst.

Var. *ochracea*, Rehb. f., in *Gard. Chron.*, 1865, p. 434; *Rev. Hort.*, 1872, p. 391, fig. a.—A form with light ochre-coloured bars on a pale yellowish ground.

31. *P. Corningiana*, Rehb. f., in *Gard. Chron.*, n.s., xi., p. 620.—A striking species, something in the way of *P. sumatrana*. Upper sepal with longitudinal purple-brown stripes and a few transverse bars at base; lateral sepals wholly purple-brown, with border and a few spots of yellowish-white; petals with longitudinal stripes and blotches; central lobe of lip rich purple-violet, with a

tuft of hairs on front middle line, and a yellow callus. Native country not stated.

32. *P. sumatrana*, Korth. and Rehb. l., in *Humb. Gartenz.*, 1860, p. 115; *Bot. Mag.*, t. 5527; *Fl. des Serres*, t. 1644.—*P. zebrina*, Teijsm. et Binn., in *Batav. Nat. Tijdschr.* xxiv. (reprint, p. 15).—A very handsome species, with short erect spikes. Flowers light yellowish-white, with a few transverse brownish-red bars; lip fleshy, the front lobe covered with numerous short hairs. Native of Sumatra and Borneo. The following varieties have been described:—

Var. *sanguinea*, Rehb. f., in *Gard. Chron.*, n.s., xv.,

FIG. 56.—PHALANOPSIS SEREIPAL: WHITE, BLOTCHED AND STRIPED WITH RED SEMI-MADDER

FIG. 57.—PHALANOPSIS SPECIOSA VAR. CHRISTIANA. Back of flower: sepals, rose-madder; petals, ivory-white.

FIG. 58.—PHALANOPSIS SPECIOSA: COLUMN, LABELLUM, AND FOLLEN MANES MAGNIFIED.

Column, white; labellum, rosy-purple, with two blotches of yellow on the side lacinia.

p. 782.—Differing in having the lateral sepals nearly wholly dark red with very few yellowish green markings.

Var. *paniculata*, Rehb. l., in *Gard. Chron.*, n.s., xvii., p. 628.—A variety with a few brownish-purple bars on the sepals and petals, and some mauve stripes on the lip.

Var. *Guerceni*.—*P. zebrina* var. *Guerceni*, Teijsm. et Binn., *l.c.*, p. 15.—Sepals and petals described as striate with violet below and spotted above.

Var. *lilacina*.—*P. zebrina* var. *lilacina*, Teijsm. et Binn., *l.c.*, p. 15.—Sepals and petals milk-white, with some lilac-coloured transverse lines and the central lobe of the lip lilac at the base.

33. *P. tetraspis*, Rehb. l., in *Gard. Chron.*, n.s., xv., p. 562; *Xen. Orch.*, ii., p. 156.—A singular species, the

flowers with the general shape of *P. sumatrana*, but shining waxy-white in colour without a spot. The front lobe of the lip bears a cushion of hairs at the apex. Native of the Andaman Islands.

34. *P. speciosa* (figs. 56, 57, and 58), Rehb. f., in *Gard. Chron.*, n.s., xv., p. 572, also xviii., p. 745, fig. 130-2; Warr. and Will., *Orch. Alb.*, t. 155.—A handsome species, closely allied to *P. tetraspis*. Sepals and petals white, more or less blotched and striped with rose-madder. Front lobe of lip club-shaped, and papillose at apex, the side lobes small, erect, and with two yellow spots. Native of the Andaman Islands. The two following varieties have been described.

Var. *Christiana*, Rehb. f., in *Gard. Chron.*, xviii., p. 745, fig. 131.—Sepals and petals broader than type, the former rose-madder, the latter white.

Var. *Imperatrix*, Rehb. f., in *Gard. Chron.*, xviii., p. 745.—A larger form with rose-purple flowers.

There seem some doubts as to whether there may not be a species of *Phalaenopsis* in New Guinea. In *Wing's Southern Science Record*, vol. iii., p. 347, I find the following note by Baron Ferdinand von Müller:—"Concerning Papan Orchids it may further be remarked that *Dendrobium Johnsoniae* should, perhaps be referred to *Phalaenopsis*, although the gibbous protuberance of the flowers is more developed than in the typical species of that genus, the labellum of other congeners being also not cirriferous; pollinia were not available for examination." *Dendrobium Johnsoniae* was discovered on the eastern peninsula of New Guinea by the Rev. James Chalmers, and was described by F. von Müller, in *Wing's Southern Science Record*, in May, 1832. The leaves are not known, as only a raceme of ten to twelve flowers was sent. These latter are described as large and pure white, except a rosy tinge over the labellum; the elongate-rhomboid sepals nearly twice as long as the lanceolate petals; the lip longer than the sepals, but shorter than the petals; the lateral lobes semi-orbicular, and half to one-third the length of the ovate central lobe. The discovery of a *Phalaenopsis* in New Guinea need not create much surprise, as several other genera with a similar distribution are already known from there, but the point must remain unsettled until more perfect specimens are forthcoming. (Since the above was written, but after it had passed out of my hands, I have seen authentic specimens of *D. Johnsoniae*, and can affirm it to be a genuine *Dendrobium*. Three flowers and a leaf were sent by Baron F. Müller, of Melbourne, to Kew, from which I conjecture that he has obtained additional specimens from New Guinea. The flowers are very fine.)

EXCLUDED SPECIES.

P. Wightii, Rehb. f., in Mohl. and Schl., *Bot. Zeit.*, 1862, p. 214, is now referred to *Doritis*.

INDEX.

Species kept up in ordinary type, synonyms in italics. The numbers refer to the numbers of the foregoing enumeration.

ambilis, Blume, 1	Luddemanniana, 30
ambilis, Lindl., 2	maculata, 26
ambigua, 2	Manni, 22
amethystina, 11	Mariei, 27
anemifera, 13	pollens, 17
Aphrodite, 12	pantherina, 21
Beda, 13	Parishii, 16
Bovallii, 23	Porter, 6
cauta, 2	Reichenbachiana, 18
Corningiana, 31	roses, 14
cornu cervi, 20	Rucheri, 1
delicata, 5	Sanderiana, 2
delicosa, 15	Schulleriana, 4
Deveraxiana, 19	speciosa, 34
effusa, 14	Subarriana, 12
Emeraldia, 9	Stuartiana, 3
fasciata, 29	sumatrana, 32
fuscata, 25	tetraspis, 33
grandiflora, 1	Valentini, 25
Hebe, 13	Veitchiana, 7
intermedia, 6	violacea, 24
leucocarpa, 2	zebrina, 32
Luwii, 8	

R. A. Rolfe, Herbarium, Royal Gardens, Kew.

WHAT TO DO WITH OUR SKILFUL GARDENERS.—We call the following, in relation to this matter, from the last number of *Garden Work*:—"I think it has been advocated that every school should have its plot of ground, which should be cultivated by the scholars—indeed, form part of their daily course of instruction. Perhaps it seems hardly fair to saddle the masters with such duties; but we have an army of gardeners—the advertisements in the gardening press plainly indicate that the supply is greater than the demand. Could not the services of some of the more suitable amongst them be called into requisition as teachers of gardening in our schools? At any rate, it would afford them part employment. What benefit, too, would result to their pupils from a more intimate knowledge and practice of the science of horticulture!"

HOME CORRESPONDENCE.

Wild Fruits.—The Crowberry (*Empetrum nigrum*), Cranberry (*Vaccinium oxycoccos*), and Blackberry (*V. myrtillus*) are unusually plentiful this season, more so, indeed, than I have noticed for several years past. The Blackberry is collected by women and children on the mountain sides and sold in the neighbouring towns and villages for sometimes as low a price as 1s. per quart. They make delicious tarts and jam, which for flavour are almost unsurpassed. To see the Cranberry just now standing with its numerous pink berries the drier knolls of some marshy ground, is extremely pretty, but to partake of the delicious cooling fruit is reviving and invigorating in a marked degree. For the fruit of the Crowberry we have not such a relish, indeed after wet weather it is somewhat insipid. *A. D. Webster.*

Judging Foliage Plants at Shows.—I was judging at a local flower show this week, and my co-judge and myself were puzzled at the words "best ornamental foliage plant." Can you or any of your readers explain it? Does "best ornamental" mean—1, the rarest and most valuable; or, 2, the best cultivated; or, 3, the most ornamental? My co-judge was rather inclined to 1; I was rather more inclined to 2, or a combination of 2 and 3. The secretary could only help us by saying that it was the usual form in all such schedules. *H. N. Ellacombe, Bilton Vicarage.* [The meaning of the framers of the schedule probably was that the prizes should be awarded to the best grown and most ornamental specimens, 2, 3. "Rare" plants have usually a class apart. Ed.]

Ardisia japonica (p. 232).—You say of this pretty shrub, "It has the appearance of being nearly, if not quite, hardy." I suppose it to be quite hardy. I have had it here for a dozen years or more; but it only lives, it does not grow at all. It was 3 inches high when it was planted, and it is the same now. Is there anything to make it grow? Mine is the variegated one [Probably the "rub" is there. Ed.]. *H. N. Ellacombe, Bilton Vicarage.*

Figs from Seed.—In the summer of 1883 I found five seedling Figs growing in an Onion bed, but whether they were the produce of home-grown or foreign Figs I cannot say. However, I am quite certain that they were seedlings, and they were put in pots, and are now about 2½ feet in height. Before the Onions were sown the ground was manured with the clearings of earth-closets. *Charles Ross, Welford Park, Newbury.*

—I observe in your paper of last week a query about Fig trees grown from seed. I have in my garden a seedling Fig tree about three years old. There is only one old tree in the parish, and it is half-a-mile from me. Surely in my case the seedling must have sprung from a foreign Fig thrown away in the rubbish-heap. *William Langley, Netherowth Rectory, Leicester.*

—I read just now your note about seedling Figs, and it interested me a good deal. The following occurrence bears strongly on the remarks of "A. P.":—"In the early spring, when my gardener was weeding one of the borders, he called out to me, 'Do you know what this is?' I did not pay very much attention to him, and after a hasty glance I said 'No.' He immediately added, 'It is a young Fig.' I then looked very carefully indeed at the object before me, and am as certain as I can be about anything of that sort, that it was a seedling Fig. I remember at the time inspecting it closely, and I have no manner of doubt upon my mind about the matter. I should say that a very large Fig tree is in my garden situated about 30 feet from the spot where this seedling was found, but it is in such fashion that no runner can possibly have come from it to the spot. The conclusion which my gardener and I came to was that the seed must have been dropped by birds. It puzzled me a great deal at the time, and though I quite understand the force of your scientific objection, I hope you will pardon me [Oh dear! yes; if pardon be necessary, which, however, we do not admit for a moment! Ed.] if I say that there are sometimes more things than are dreamt of in our philosophy, and I verily believe this is one of them. It is only a matter of the greatest regret to me to have to add that the young Fig tree has disappeared from the scene. I went to look for it immediately after reading your note, but its place knows it no more. Since writing the above I have seen my gardener, and he tells me there were two seedling Fig trees about 9 inches high. He thought they were in the wrong place, and so he pulled them up, and threw them away, and so they went away from home. He is—as I am—quite sure as to what these seedlings were. *H. E.* [We do not question the possibility of the occurrence, we merely say that no satisfactory evidence has yet been brought

forward. It may well be that the seedling Figs alluded to by our correspondent were derived from imported Figs. It is not long since we heard of a number of Currant Grapes growing in the Essex marshes, near a sewage farm or some similar locality. Other communications on the same subject have been received, some of which will be published later on. Ed.]

Orchid Nomenclature.—I have been unable to reply to Mr. O'Brien's letter on pages 798-9, of June 19, pending my return home, as while away I had insufficient notes to refer to. I am glad that *Vanda cereulescens vesta* is not the same as *V. e. boxalli*. I reiterate that *Cattleya Percivaliana alba* had another name attached to it, for, in correspondence on this plant (before I wrote my letter which appeared in P. 767, of the June 12 issue), I heard that the flowers were sent by my informant, to Professor Reichenbach, who named the plant *C. crocata*. The late Mr. Percival only bloomed one plant of this *C. Percivaliana alba* (?), therefore it is obvious that this individual plant did get two names, or rather its blooms, for neither the Professor nor the Royal Horticultural Society's Floral Committee saw the plant before them, for, referring to the *Gardener's Chronicle* of February 9, 1884, p. 219, I see it says, "a cut bloom." It may be for a moment dispate the information Mr. O'Brien gives in his letter of *C. crocata*, but it is perfectly clear to me that some one can know nothing about it (or, not know enough, at any rate), but, whether it is Professor Reichenbach, the Royal Horticultural Society's Committee, Mr. O'Brien, or myself, I leave your readers to judge. *De B. Cranbury, August 19.*

A Profitable Potato.—I planted 1 lb. of the Queen of the Valley Potato on August 11, and to my surprise, when I dug them on August 14, the produce was 62 lbs.; they were all sound and good, and nearly all of large size. *J. W. Mills, Minton.* [It has been much exceeded, notably in the gardens of Provost K. C., Cambridge, September, 1869, when Mr. Castle, the gardener, lifted 142 lb. of Early Rose from 1 lb. of sets. Ed.]

Novel Method of Healing Barked Stem of Holly Tree.—On the south side entrance to a large and well managed nursery in the North of Scotland are two large and well balanced trees of variegated Holly, which form an object and attraction to all passers by. In the severe winter of 1879-1880 a large patch of bark was removed from the stem of one of them, most probably with the object of being converted into bird-lime. The large wound would undoubtedly in time have caused a considerable interruption to the uniformity of growth, and have spoiled the grand feature of the pair. The annoyance caused the owner some unhappy thoughts, but with his prompt conception and usual characteristic energy he was soon on the track of a remedy which has proved to be so effectual as to be scarcely observed, and which has kept the tree in uniform good health, notwithstanding its maltreatment six years ago. The remedy here spoken of was simply cutting the edges of the wound clean out and rounding the corners, and then by taking off a similar patch of bark from another tree of less value and applying it to the injured part, which was afterwards tightly strapped over, and covered with a good plaster of prepared clay, adhesion was soon effected. The plan is as simple as it is novel, and is worthy of being made generally known. *J. Webster, Gordon Castle Gardens.* [Perhaps the gentleman knew something of surgery, and had heard of the cure of ulcers by skin-grafting. Ed.]

Peach and Nectarine on the Same Shoot.—I hereby send you a bit of branch from a Barrington Peach, bearing a fully developed fruit, and touching it on the same branch, a fully developed Nectarine. Therefore send it in order to ascertain your opinion on the matter. I may state that in the same house is a tree of Victoria, and also a tree of Albert Victor Nectarine. *John Carvel.* [Such cases occur occasionally, and show that the Nectarine was originally a sport from the Peach. We have figured examples of this in a former volume, and Darwin has collected numerous records of such cases. Ed.]

Peas: a Plea for the Older Varieties.—I think when some of the newer kinds, such as Telephone, Telegraph, and Gladiator, are found to be utterly useless in such a season as the present one, as I have found them, as well as others of your correspondents, and when older but well tried varieties, such as Criterion, Huntingdonian, Champion of England, British Queen, Supreme, Ne Plus Ultra, and Emperor of the Marrows, still maintain their position, and give notice, as this has been a very trying season for Peas, and I never saw doing better than at the present time, or freer from mildew.

And where Peas are in demand every day throughout the season, it would be a serious matter for the gardener who has newer kinds entirely depended upon for the supply, and not supplemented by the older varieties (at I have better appearance on the exhibition table, but few judges will pass over a dish of Ne Plus Ultra for them for flavour. I always make a sowing of the new varieties, and one of the old at the same time, for, no matter how bad the season may be, the old kinds named may be depended on to produce pods in plenty. I generally gather Ne Plus Ultra and Emperor of the Marrows up to the end of October, in fact until the end of my frost. *Edward Ward, Hewell Gardens, Brompton.*

Pea Prodigy.—I notice in the *Gardener's Chronicle* of August 7 an account of this Pea. Now I have grown it this year by the side of both Telegraph and Telephone; it is a good Pea, a heavy cropper, and some of the pods are very fine, but there are many pods of smaller dimensions than is to be found on either Telegraph or Telephone. The best are large and long-shaped, but lack the fine sweet flavor of Telephone, and the uniformity of bearing of that sort. The first crop which it was fully a week in coming into flower, and yielding. I think Mr. Keely cannot have had his Telephone from Messrs. Carter, as I did. I have tried all the new Peas of this year, and, having tested them all, can find nothing to equal Telephone as a second early. *F. Wood, Oak Lawn, Forest Hill.*

Telephone and other Peas.—I am sorry to see from Mr. Rust's note (p. 215, also p. 244, "W. H. D.") the bad account given of the above Pea. With us it has been very large pods, very full—and it has kept the trees supplied for a longer period than some of the older varieties. We give it plenty of room, and sow it to succeed Veitch's Perfection, of which we grow a large quantity. They were very good this season—very heavy crops, well filled, as is generally the case with this splendid main crop Pea. Sturdy, which is just coming into bearing, is a great favourite, and never fails with us. It also has the good point of taking up but little room, and is very useful if sown at one or three different times; it also stands drought well. *Geo. Mythen, Teddesley Park.*

Grape and Peach Growing at Manresa House, Rochester.—Peaches here, both in the houses devoted to this fruit and on the open walls, are again this year a wonderful crop. Early forcing, such as practised when the matchless tree of Grosse Mignonne at one time in existence at this place was in bearing, is not now carried out. In the earliest house the fruit was ripe at the latter end of June; there was a good green crop. The second house, a long lean-to, of considerable height and width, contains six large trees, which were, when first approaching the ripening stage, and which for quantity and weight was such as rarely met with. One tree, a Red Magdalen, covering 480 feet of trellis, carried seventy-two dozen fruit. The next tree, Stirling Castle, is only a little smaller than the last named, and was bearing an equally heavy crop. The others, which include a Royal George Peach and an Elrage Nectarine, were alike bearing heavily. The condition of the trees, combined with the appearance of the fruit, gave promise of its attaining a size little if any below what is usually seen where the crop is much lighter. The third is a hip-roofed house, 150 feet long and 13 feet high, with an east aspect. Here the trees occupy the wall, and are carrying a crop like in quantity to those already mentioned. In front a Black Hamburg Vine, consisting of four rods trained horizontally along the lower part of the glass, so as not to come more than 5 feet up the wall, is stretching out at a rate that will shortly enable it to reach the opposite end of the house; it was carrying a lot of handsome bunches that will come in late. Out-of-doors there are three walls each 210 feet long, the south side of which is covered with Peaches and Nectarines; the trees collectively are laded to an extent which nothing short of the liberal feeding they receive, and the copious supply of water applied to the roots and overhead could enable them to bring up to the requisite size. But Mr. Davis has given a simple proof of what can be done in Peach growing, and is not likely to make mistakes in this direction. Pipes are laid down in front of the borders to which a hose can be attached at intervals, and in this way the trees get the large quantity of water they require, which may be said to rarely occur with outdoor Peaches in dry summers, and through this they are not able to mature anything like the weight of fruit they otherwise would. Another wall, over 200 feet long, running north and south, is planted on both the east and west sides with Peaches and Nectarines. The trees on the east side are this year bearing well, as they usually do; on the west side they do not succeed so well, some large standard Pears and Apples at a short distance interfering with them. Returning to

the indoor department, the big Black Hamburg Vine which fills the 224 feet house has been eased somewhat this season. The reason for this is apparent in the immense weight of fruit it has been let to carry was telling upon it, for though the crop has each season finished up as black as possible, still the last summer's wood was weaker than before. Last year it bore 807 bunches, which weighed 1025 lb. The present crop has been reduced to something over 600 bunches. In the adjoining house, 70 feet in length, the established vines (Black Hamburg), which have all along borne well, are being given the same variety way for a single vine of the same variety, which, like the big one already noticed, is being trained horizontally from one end, and which will soon fill the whole. This Vine is carrying a heavy crop of large bunches; the size and substance of the leaves tell the vigorous state it is in. A leaf that I measured was 10½ inches across. Two houses, each some 70 feet long by 12 feet wide, are filled with Melons. Only one sort—a scarlet-fleshed variety—is grown. The plants were sown in the first week of July. In 1883, 700 Melons were grown in these two houses. In addition to the walls occupied by Peaches, already mentioned, there is a large extent on which Cherries, Pears, and Plums are grown; these run about 11 feet in height. The trees are comparatively young, and in a healthy thriving state. A few years since they had reached the top of the walls, and to give them more room to extend, Mr. Davis had iron uprights from 5 to 6 feet high fixed to the top of the walls, and on these stout wires were stretched. The trees have covered the additional space, and bear quite as well on the upper part, where necessarily they have not the protection which the walls give to the lower portion. *T. B.*

Amateur Bulb Dealers.—Gardeners are very often placed in positions of temptation, for solicitations are made to them for garden products from all kinds of persons and traders, legitimate and illegitimate. In too many instances temptations of this sort are intensified because salaries are too low, and gardeners are almost constantly in an extravagant state of mind. Thus it presents to many a man a plausible and strong inducement to look out for themselves when they receive from amateur bulb-dealers, and possibly also from traders of unscrupulous tendencies, invitations to trade, and who privately but boldly offer to gardeners discount on their orders at the rate of 10 per cent., or 2s. in the pound. Of offers of this kind one has come to my notice—a duplicate probably of many similar ones—received by gardeners all over the kingdom during the past few days. The dealer hails from a well-known midland town, and seems to combine dealing in bulbs and in jewellery. What association there is between bulbs and watches that the same person should embark in trade in both is not evident, and so far there seems little to connect them; when, however, this same trader intimates that he is in receipt of several tons weight of bulbs, it would seem as if jewellery could not occupy any considerable part of his business purposes. The trader does not make it clear in his circular whether he departs from his legitimate vocation and enters into the business of bulb dealing from motives of public interest or private gain. He may have felt that the public have long enough groaned under the iron heels of home bulb dealers, and that it was his duty to afford them relief from bondage. It may be that jewellery as an article of trade is just now under a cloud, and that bulbs offers a more hopeful field for trading. Certainly the Dutch growers themselves have long since pretty well cut the home retail trade to pieces, so that the presumed bondage does not exist, and the public have ample opportunities to purchase where and how they please. But comparison of his prices with those of some good Dutch lists as offered so freely to home purchasers shows that our amateur trader has protected himself by some 20 per cent. increase, so that he can well afford to give to any gardener favouring his goods the good old 10 per cent. discount, and put at the same time a good profit into his own pocket. As to secure this same tempting 10 per cent. the gardener must cause his employer to pay 20 per cent. higher prices than he would be called upon to pay from recognised dealers, the story needs no moral. *D.*

Nomenclature of Garden Plants.—Referring to your remarks under the heading of Nomenclature, *Gardeners' Chronicle*, Aug. 14, will you permit me to thoroughly endorse all your observations. The subject is one which is continually cropping up and demands that some notice shall be taken of it. As a seedsman (both wholesale and retail) I am constantly having my attention called to numbers of articles which one cannot fail to recognise, and which are being sent out by others under some new name, or, more often still, with their own name attached, which is, and will continue to be extremely annoying to nurserymen and gardeners. The annual trials made at Chiswick and the attention which has been devoted so largely of late to the subject of no-

nomenclature it should not be necessary to resort to any other means, even for the sake of a possible increase of trade. And when one remembers the great pains which are being taken to classify all the known varieties, I think the least we can do, as a matter of principle, is to abide by the decision of such eminently practical men as those who preside over the trial grounds of the Royal Horticultural Society. I would venture to suggest, as a partial remedy for the existing state of things, that at all our shows the judges (with whom lies the responsibility of giving awards), be enjoined to withhold a prize from a variety which may be shown under a false name. I think this would tend in a measure to correct the existing evil and help to bring about a better state of things. *L. Wilson Serpell.*

Reports of Societies.

ROYAL HORTICULTURAL: August 24.

THE conservatory at the Society's Gardens, South Kensington, was on this occasion full of overflowing of vegetables and flowers, and "drew" unmistakably by reason of the major portion of the exhibits being furnished by the artisan and the cottager. But few really inferior productions were observed in the divisions contributed by these new workers. The permanent exhibition of hardy flowers belonging to Mr. T. S. Ware, the Lilies from the New Bull Company, Colchester, the display of Roses by Messrs. W. Paul & Sons, and Messrs. G. Paul & Sons' hardy flowers and picture tree foliage, gave additional interest to the meeting.

Floral Committee.

Present: G. F. Wilson, Esq., in the chair; and Messrs. W. Bealby, T. Baines, H. Herbert, A. Perry, H. Bennett, C. Noble, A. F. Lendy, G. Duffield, J. Donny, H. P. Pollett, J. O'Brien, E. Hill, H. Turner, M. T. Masters, and J. Walker.

The New Plant and Bulb Company exhibited a variety of *Cattleya superba* from Colombia; the sepals and petals are narrow, of a shade of rosy-purple, the lip being dark purple, and of a velvety appearance; the pseudobulbs elongated, and about 6 inches in length; Impatiens *Jerdonei* and *I. concolor*, the latter rose-pink and yellow; habit very dwarf.

G. Hardy, Esq., Timperley, Cheshire, showed *Cattleya gigas*, Hardy's var., a variety possessing a great lip of the richest purple tint.

J. B. Fisher, Esq., Wilton House, Southampton, showed the starry-flowered *Mastixaria setigera*.

Mr. Eckford, gr., Boroaton Park, Sirewsbury, contributed many varieties of Sweet Peas and Panicles, the latter varied, but devoid of merit.

Messrs. J. Veitch & Sons, Royal Exotic Nursery, Chelsea, exhibited a quantity of blooms of hardy hybrid Gladiolus, the finest being *Voltaire*, of a deep cerise with spots of yellow on the three lower segments; *Sanderi*, bright scarlet, spotted after the manner of a *Tydra*, habit very branching substance; *Scepter d'Or*, a prismatic colour, with broad crimson spots on the throat; *La France*, light rose and dark crimson.

Mr. R. Dean, Kanelagh Road, Eling, showed a very large strain of African Marigold, 4 inches in diameter, named "Dean's Mammoth," and *Chrysanthemum hybridum*, "Sambam," *C. coronarium* and *C. seguetum*; it has yellow rays and orange disc. It forms no seeds. Some *Galiladria Lorenziana* and *Dianthus laciniatus* flowers came from the same exhibitor.

Mr. W. Noble, Bagshot, showed a spray of *Clematis Jackmanii*, exhibiting white and the normal purple flowers growing on it.

Mr. Blundell, nurseryman, West Dulwich, showed fine seedling *Hollyhocks*, of which the following were very nice: *Blooms*—Mary Anderson, a primrose; W. G. Head, a crimson; Princess Victoria of Wales, very pale, flesh tint; and Miss Rouppel, salmon-yellow.

Mr. King, gr. to P. Crowley, Esq., Waddon House, Croydon, showed *Chrysanthemum Madame De Grange*, a large white flower with reflexed petals—a good bloom, well grown.

Mr. J. Turner, nurseries, Slough, showed pompon *Dahlia Eccentrica*, in the flowers of which varying proportions of orange and crimson colours are found. A collection of forty-eight kinds of fancy and show Dahlias, beautifully fresh and finished blooms, and *Dahlia Bendigo*, a new variety, of a rich crimson, and of perfect form.

Messrs. Paul & Son, The Old Nurseries, Cheshant, exhibited a collection of cut flowers of hardy perennials, receiving a Silver-gilt Medal. Placed amongst the flowers were bunches of foliage of *Ulmus Russelli* var. strong, healthy, and of a fine yellow tint; *Acer Negundo* robusta, a stronger variety than *A. N. variegata*; purple-leaved Birch, very distinct; well flowered shoots of *Catalpa syringifolia*; *Prunus Pissardi*, in vigorous growth; some forms of silver-leaved *Elder*; *Ulmus campestris rubra*, with pretty bronzy foliage; *U. planifolius aureus*, with bold yellow-green leaves; a variegated form of the Turkey; and *Ceanothus pallidus*, with delicate light blue flowers.

Some twelve boxes of fair Roses for the season came from Cheshant, amongst them being Bennett's Rose

Her Majesty, a plant carrying one large bloom. This is the first time this Rose has been seen in bloom here, since it was sold in 1883. Pompon and *Cactus Dahlias* and *Anemone japonica* also completed this display.

Messrs. Cannell & Sons, Swanley, showed cut flowers of single *Dahlia*, bonnet ditto, and many single varieties in bunches; amongst these latter Mr. Rose, a white, profusely striped with lake, came in for recognition. Bunches of *Carotation* *Dahlia* of Penhurst and *Salpiglossis* came also from the Home of Flowers.

Messrs. Webb & Brand, nurserymen, Saffron Walden, exhibited new *Hollyhocks* in great variety, showing both spikes and single blooms; the foliage and flowers were both healthy and well formed.

Messrs. W. Paul & Son, Waltham Cross, showed twelve boxes of bunches of Roses of exceedingly good quality for the season. A Silver Banksian Medal was awarded.

Messrs. Kelway & Son, Langport, Somerset, exceeded their previous efforts with *Gladioli*, the flowers set up being both numerous and of fine quality throughout, and, considering the distance travelled, very fresh looking. The best were *Lady McFarren*, white, feathered very slightly with purple on the edge—large flowers, which were open on at least a foot in length of the spike; *Lord Ashbourne*, rosy-crimson, feathered with a darker shade—the flower bold and large; *Empress of India*, white, profusely feathered, flamed and suffused with mauve—a large flowered spike 18 inches in height; *Lady Salisbury*, white, feathered slightly with crimson—flowers 3 inches across; *Prince Edward of Saxe Weimar*, scarlet, with a trace of orange, feathered at the edge with purple. A Silver-gilt Medal was awarded for this fine show.

The New Plant and Bulb Company made a brave display with *Lilium auratum* and a few other species. A Silver Banksian Medal was given for it.

Mr. Ware, Hale Farm, Tottenham, received a Silver Banksian Medal for a collection of dry flowers of greatly larger dimensions and variety than usual; it was rich in *Phloxes*, *leeland* *Poppies*, *Lilies*, *Galliards*, and *Dahlias*, both single, *Cactus* and pompon—Miss Lanker, a single-flowered *Dahlia*, with rosy-crimson flowers, the area surrounding the disc of a golden colour; and *Ames Perry*, another of the same class, of a port-wine colour, edged with crimson being considered the best of the new varieties. *Dahlia Yellow Constance*, a *Cactus* variety, a bright yellow flower, with straight and fluted petals, was also awarded.

Mr. Carter & Co., Holborn, received a Silver Banksian Medal for varieties of *Asters* taken from the open ground and potted. They consisted of French *Penny Chrysanthemum*-flowered, *Victoria Dwarf German*, and *Pyramidal German*. Planted three in a 6-inch pot, the plants made a good show at one end of the conservatory.

FIRST-CLASS CERTIFICATES.

To Messrs. Kelway & Son, for *Gladiolus* Lord Ashbourne.

To Messrs. Kelway & Son, for *Gladiolus* Empress of India.

To Messrs. Kelway & Son, for *Gladiolus* Prince Edward of Saxe Weimar.

To Messrs. Kelway & Son, for *Gladiolus* Lady MacFarren.

To Mr. Ware, for single *Dahlia* Miss Lanker.

To Mr. Ware, for *Cactus Dahlia* Yellow Constance.

To Messrs. J. Veitch & Sons, for hybrid hardy *Gladiolus* *Voltaire*.

To Messrs. H. Cannell & Sons, for single *Dahlia* Mr. Rose.

To Mr. C. Turner, for pompon *Dahlia* *Eccentrica*.

Fruit Committee.

Present: T. Francis Rivers, Esq., in the chair; and Messrs. Harrison Weir, P. Crowley, F. Rutland, J. Burnett, W. Warren, W. Paul, C. Silverlock, J. Fildan, and G. Bonyard.

A collection of early Apples was shown by Mr. Taylor, gr. to Sir J. Lubbock, High Elms, Downe, Kent.

Some Sprouts, named the Jubilee, came from Mr. R. Gilbert, Burrell Gardens.

Two seedling Melons, named Combe Bank Seedling, were shown by Mr. Griffin, gr. Combe Bank, Kingston, but were too ripe to be judged.

The Cottagers' Show.

This exhibition of cottage garden produce quite exceeded that of any previous year in quality, and as far as the respective classes were concerned being almost confined to single dishes; the entries were extraordinary, giving the judges unusually difficult work. The most favoured exhibitors came respectively from Oxon, Bucks, Essex, and Kent, although some other districts were very well represented. Not a few of the exhibits, especially Potatoes, Runner Beans, Cabbages, Carrots, and Turnips, could hardly have been excelled by the best of private gardeners; thus showing that, consequent upon the admirable tuition given by the numerous shows of cottagers' garden produce held throughout the country, there is to be found, at least as far as vegetables are concerned, a degree of skill which bodes well for gardening in the future amongst the working classes. Whether all the exhibitors would be accepted in their respective specialties as *bona fide* cottagers is a subject upon which it may be well not to inquire too deeply; still, appearances

favoured the assumption that the majority were working men.

Taking the classes in their order—

POTATOS

were very finely and numerous shown, no less than thirty-six lots of three dishes being staged in that class. Mr. Gibbs, Sevenoaks, was a good 1st, with handsome Breesee's Provençal, Vicar of Laleham, and Woodstock Kidney; Mr. Willard, Eynesford, Kent, came next, with Radstock Beauty, Vicar of Laleham, and Adirondack; and the 3d included, with the two latter, good Reading Russet.

There were no less than forty-two single dishes of Potatoes, from which very fine Fillbasket, from Mr. Kirtland, Blechington, Oxon.; Reading Russet, from Mr. North; and Vicar of Laleham, from Mr. Venn, of Maidstone, took the leading prizes.

PEAS.

Eleven lots, of two dishes, were staged, Mr. Gibbs coming 1st with very fair Telephone and Stratagem; Mr. Kirtland, Blechington, Oxon.; Reading Russet, from Mr. North; and Vicar of Laleham, from Mr. Venn, of Maidstone, took the leading prizes.

Twenty-one single dishes competed—Stratagem, from Mr. Kentish, Hengstead, Herts, was 1st; Ne Plus Ultra, from Mr. Sheppard, 2d; and same from Mr. Neal, Aston Clinton, 3d.

ONIONS

were chiefly of autumn sowings, some very fine bulbs of the Giant Rocca, from Mr. Hasker, Colehill, Wilt; coming 1st; admirable White Spanish coming next, from Mr. Hall, Dartford; and other Roccas, from Mr. Nunn came 3d.

CABBAGES

came after—eighteen lots of three heads being staged, rather uneven, though mostly clean and good. Mr. Banning, of Enfield, had the finest in good Enfield Market; Mr. Dormer, of Aldenham, Herts, coming 2d, with Daniel's Defence; the Enfield again being 3d, from Mr. Hall.

LETTUCES.

Nearly all of the eighteen lots shown were Paris White, Mr. Dredge, of Blechley, having the best; Mr. Dormer coming 2d.

RUNNER BEANS.

This was the best filled class, of which there were thirty-five dishes, a splendid dish of Ne Plus Ultra, coming from Mr. Kirtland, being 1st; Mr. Richardson, of Enfield, being 2d, with Girtford Giant; and Mr. North was 3d. Only seventeen lots of Broad Beans were staged, and these somewhat browned by exposure. The best came from Mr. Venn, Acton; and Mr. Munroe, Dingwall, N.E.

TURNS AND CARROTS

were very fine, clean and handsome, almost all being white. Messrs. Bunce, Tring; Smith, Eynesford; and Willard had the best, chiefly of the Snowball type. There were twenty-five bunches of the former and thirty-five of the latter, generally superb samples, some being especially so.

Mr. North had 1st place, with very handsome Long Surrey, perfect models; Mr. Kirtland coming 2d, with beautiful new Intermediate; and Mr. Nunn was 3d, with the same kind.

BEEF

were not so good, but fair samples came from Mr. Kirtland, Maidstone, and Mr. Whitley, Wycombe.

CAULIFLOWERS.

Eleven lots were shown, Mr. C. Beckett, of Penn, Bucks, coming 1st, with good Autumn Giant; Mr. Dormer 2d, with Walcheren; and Mr. Munroe 3d.

CUCUMBERS

were in force, fifteen fruits being staged, but the sample was not first-class. Mr. Castle, Maidstone; Mr. King, Enfield; and Mr. Smith, Eynesford, took the chief prizes.

VEGETABLE MARROWS

were again a great class, thirty pairs of all sizes and sorts being staged. Some neat medium-sized long white fruits were 1st, from Mr. Richardson; Mr. Gibbs being 2d; and Mr. Weal, Ealing, 3d.

TOMATOS.

Mr. Beckett had the best dish in Perpetual; Mr. Tims, Amersham, 2d; and Mr. Jacob, Petworth, 3d.

FRUIT.

There were fifteen dishes of Apples in the one class. Mr. C. Hager, of Newbold, Mr. Hooker, Ottershaw; and Mr. Strange, Dulwich, having the best in Lord Suffield.

Six lots of three dishes were staged, Mr. Jacob coming 1st with good Lord Suffield, New Hawthornden, and Gloria Mundi; Mr. Strange was 2d.

There were nineteen dishes of Gooseberries, red and white kinds being shown, the finest being Lancashire Lad, 1st, for Mr. Willard; and Mr. Harvey of Hertford, was 2d, with fine Whitesmith; Lancashire Lad again coming 3d for Mr. North.

Both red and white Currants were largely shown in the class for one dish, the best, a handsome sample, being from Mr. Dormer; Mr. Jacob being 2d.

Mr. Waghorn was 1st with red Cherries, Mr. Hentish

being 2d, and Mr. Crout, Maidstone, 3d. Of course all the same variety Morellos.

A miscellaneous class was well filled, the exhibits comprising collections of vegetables, Plums, Pears, and other fruit in considerable quantity.

The First National Co-operative Flower Show.

This competition being confined to amateurs and the gardeners of members of the Agricultural and Horticultural Association, of which Mr. Edward Owen Greening is the Managing Director, took place in conjunction with the Cottagers' and Artizans' Show. It may be stated that the prize-money was furnished by the Association, the Royal Horticultural Society permitting the exhibition to take place in the conservatory. The general arrangements were directed by Mr. Barron, who had a band of stewards formed of members of the Association acting under him, and arranging the exhibits. As a first attempt the show must be considered not wholly unsatisfactory, although the competition was not generally very keen, and it is alleged that the judges who made the awards had some reason to doubt whether some of the exhibits, and especially the Cauliflowers shown in some of the classes, had not been purchased instead of being grown by the exhibitors. This is a practice which, if really indulged in, the executive of the Association should do its utmost to suppress. The prizes were in several of the classes disproportionately high compared with the nature of the exhibit; and if one great aim of the Association is to encourage cottage and allotment gardeners, meaning thereby, we presume, poor men in the receipt of weekly wages, professional gardeners in large private places should not be allowed to compete with the working men on equal terms. As it is the desire of the executive not only that the flowers shown should be encouraged by local branches, but also that one large aggregate exhibition should be held annually, the matter just referred to should be well considered before another schedule of prizes is issued.

Taking the schedule in the order of the various classes, forty-four in number, the awards of the judges were as follows:—

Peas, 4 peck.—1st, Mr. George Bull, West Haddon, Rugby, with Telephone; 2d, Mr. George Ledbourne, Wilton, near Manchester, with Dr. Macleao.

Longpod or Broad Beans.—1st, Mr. Joseph Foxley, New Road, Mumford, Cheshire, with good Seville Longpod; 2d, Mr. F. Sexton, The Cottage, Northampton, with Windsor Beans.

Mr. W. Powers, 144, Victor Road, Penge, was 1st with Scarlet Runners, having a good dish; Mr. F. Sexton being 2d; and the last-named was the only exhibitor of three heads of Cauliflowers, having the 1st prize awarded to him.

Mr. C. Foskett, 2, Hamilton Villas, Morland Road, Penge, was 1st with three Cabbages, showing fine Enfield Market; Mr. Joseph Foxley being 2d, with the same.

Mr. James Adams, West Haddon, Rugby, had the best six Carrots, staging good Long Red Surrey; Mr. J. Sturch, also of West Haddon, being 2d.

Mr. E. Hurst, Heybridge, Maldon, Essex, had the best Beet, staging Covent Garden; Mr. W. Pewsey, Staines, being 2d, also with Long Red; Mr. J. Sturch 3d, with Egyptian Turnip-rooted.

Onions were largely shown. Mr. W. Cobbold, Heybridge, Maldon, was 1st, with good Tripoli; Mr. F. Sexton being 2d, with the same; and Mr. George Ledbourne being 3d, with White Spanish.

Mr. George Bull had the best six Turnips, Mr. F. Sexton being 2d.

Mr. J. Sturch had the best nine kidney Potatoes, staging good examples of Cosmopolitan; Mr. G. Mitchell, Haseltine Road, Lower Sydenham, being 2d, with Lapstone.

The classes for Cos and Cabbage Lettuces did not bring any competitors; doubtless all had gone to seed.

Twelve round Potatoes.—Mr. J. Adams, West Haddon, with Vicar of Laleham, 1st; Mr. G. Mitchell being 2d, with the same.

One Cucumber.—1st, Mr. J. Foxley; 2d, Mr. J. Sturch, with pretty good specimens of Telegraph.

Two Vegetable Marrows.—1st, Mr. J. Sturch; 2d, Mr. C. Kemp, Kings' Corner, Brampton.

Six Tomatos brought no entry.

Annals, six distinct varieties.—1st, Mr. J. Sturch, with nice bunches of Stocks, Godetia Whitney, Malope grandiflora, Antirrhinum, Scabious, and Candytuft; 2d, Mr. G. Bull, with Helichrysum, Zinnia, Verbenas, Scabious, Chrysanthemum coronarium, and Mignonette; 3d, Mr. Edmund Cooper, 57, Waddington Street, Norwich.

Stocks, double, sixspikes.—1st, Mr. J. Foxley; 2d, Mr. G. Bull; 3d, Mr. A. Martin, 188, Nelson Street, Norwich.

Asters, six cut blooms, any variety.—1st, Mr. J. Sturch, with some good gilled varieties; 2d, Mr. G. Bull, with Peony-flowered; 3d, Mr. G. Bull, with quilled.

Bouquet of cut flowers from "One and All" seeds:

1st, Mr. A. Martio; 2d, Mr. G. Bull; 3d, Mr. E. Cooper.

Collection of vegetables, six kinds.—1st, Mr. F. Sexton, with Carrots, Potatos, Cauliflower, Runner Beans, Onions and Marrows; 2d, Mr. W. Powers; 3d, Mr. C. Foskett, 8, Hampton Villas, Norland Road, Penge.

For the best exhibits grown with the "One and All" artificial manures nothing was shown good enough to justify an award being made.

It should be stated that all the exhibits in the above classes were open to members of Industrial Co-operative Societies for exhibits grown from seeds supplied by the Association.

The second section of the schedule of prizes was open to amateurs and the gardeners of members, the exhibits also to be grown from seeds supplied by the Association.

Peas, three dishes, three varieties.—Two good collections were staged, Mr. Bull being 1st, and Mr. Carter 2d.

Lettuces, three specimens of two kinds.—No competition.

Cabbages, three specimens of two kinds, one to be One and All, one Earliest of All.—No competition.

Three heads of Cauliflower.—1st, Mr. J. Dean, Titsey Gardens, Limsfield, Surrey; 2d, Mr. E. Hurst, Heybridge, Maldon.

Beans, Broad or Longpod.—Mr. J. Dean was awarded 2d prize for some Mazagan.

Scarlet Runners, fifty pods.—1st, Mr. G. W. Waugh, 41, Abbey Road, St. John's, S.E.; 2d, Mr. O. Goldsmith, the Gardens, Poleston, Dorset.

Melons, best brace.—1st, Mr. O. Goldsmith.

Tomatos, best twelve.—1st, Mr. C. M. Carter, Upton Villa, Eastbourne, with fine Large Red.

Carrots, best six.—1st, Mr. C. M. Carter, with good Long Red Surrey; 2d, Mr. J. Dean, with James' Greentop.

Onions, twelve.—Mr. C. M. Carter was awarded a 1st prize.

Cucumbers, brace.—1st, Mr. O. Goldsmith, with Telegraph; 2d, Mr. C. M. Carter, with the same.

Vegetable Marrows, pair.—1st, Mr. O. Goldsmith; 2d, Mr. J. Dean.

Twelve kidney Potatos.—1st, Mr. O. Goldsmith, with Rivers' Ashleaf; 2d, Mr. J. Whittaker, Hampton Hall, Shrewsbury, unnamed. Fine dishes of International Kidney and Miss Fouer were passed over because diseased.

Twelve round Potatos.—1st, Mr. O. Goldsmith, with Schoolmaster.

Beet, six.—1st, Mr. J. Dean; 2d, Mr. O. Goldsmith.

Collection of vegetables, nine kinds.—1st, Mr. J. Dean, with Cauliflower, Potatos, Carrots, Peas, Celery, Turnips, Scarlet Runners, Beet, and Tomatos; 2d, Mr. J. Gore, the Gardens, Glenleigh, near Hastings.

Stocks, six spikes.—1st, Mr. T. Austin, Kimberley Terrace, New Mills, Tring; 2d, Mr. G. W. Waugh.

Asters, six blooms.—Mr. J. Dean; 2d, Mr. C. M. Carter.

Twelve single Dahlias.—1st, Mr. G. W. Waugh—a rather poor lot.

Pansies, twenty-four blooms.—One exhibitor had twelve blooms, but the stand was passed over; and two dozen are too many to require at this season of the year.

Bouquet of hardy flowers.—1st, Mr. J. Gore; 2d, Mr. O. Goldsmith; 3d, Mr. C. M. Carter.

Collection of annuals, six distinct varieties.—1st, Mr. O. Goldsmith, with Godetia, Cyanus minor, Coreopsis Drummondii, Asters, Marigold, and Zinnia.

For the best exhibit grown with the "One and All" artificial manures no award was made.

In the miscellaneous class an extra prize was awarded to Mr. J. T. Barnham, 38, Parthenia Road, Fulham, for a collection of vegetables.

CHEADLE FLORAL AND HORTICULTURAL: August 20 and 21.

The nineteenth annual show in connection with this Society took place on Friday and Saturday, August 20 and 21, on ground kindly placed at the disposal of the committee by Dr. Godson. The weather on the opening day was all that could be desired, and a good many visitors patronised the show. There was every appearance of a fine day on the Saturday. Given these conditions there is a certainty that large numbers would attend the show, and for this annual display has taken such a hold of the district and inhabitants that the attendance on a fine Saturday is always reckoned by thousands. [We have been informed by a correspondent that these hopes were well fulfilled. Ed.] The show this year is a great improvement on any that have been held under the auspices of the Society, and that is saying a good deal, for previous displays have been very creditable, and the classes always well filled. The tent space required this year is as follows:—The ground tent immediately on the left on entering the field was 181 by 36 feet, the fruit tent measured 96 by 36 feet, the nurserymen's

tent 65 by 30 feet, the tent for stove and greenhouse plants, Ferns, Caladiums, &c., was 200 feet by 50 feet, also a large one for the exhibition of bees and honey by the Cheshire Bee-keepers' Association. Two other tents were also in requisition for refreshments, showing altogether an area approaching 42,000 yards under canvas. The schedule contained ninety classes, and the increased amount of money prizes offered in some of the more important classes had the effect it was hoped would follow such a bold venture. In the open classes some grand specimens of Palms, Ferns, and Crotons among foliage plants, and Ixoras, Dipladenias, Allamandas, and Ericas in the flowering, were to be met with. It is perhaps doubtful if, in any exhibition that has recently been held, a grander lot of Ixoras were ever got together. Mr. Cypher, who is as well qualified to give an opinion upon this point as any man in England, could not but express his pleasure and surprise at seeing so many gathered together in the large exhibition tent.

The fruit all through was of excellent quality. Black and white Grapes were numerous, fine in bunch and berry, and splendid bloom on the black varieties. The Peaches and Nectarines were good. Gooseberries unusually large. A capital lot of Melons was also staged. The many classes of vegetables were well filled. Strong competition took place here, and so uniformly good were the stands that much time and discrimination were needed to apportion the awards in their true order and merit.

In the class for ten dishes of vegetables, twelve stands were placed upon the stages, many that secured no prize at all were better than sometimes we find the 1st prize awarded to at other good shows. It would be taking up too much space to go through the whole of the classes and note the exhibits in each group. Those that struck us as being most worthy must suffice for the whole.

PLANTS

Fifteen stove and greenhouse plants (open).—Mr. J. Cypher, Cheltenham, and Mr. K. Mackellar, gr. to J. Wells, Esq., Abney Hall, Cheshire, staged two grand collections. A considerable difficulty was experienced as to which was the more worthy, but at last the prizes fell in the order in which the names appear. The specimen of *Ixora Duffii* in this group had eleven trusses of its showy blossoms, several of them measuring 15 inches over. Mr. Mackellar's group contained a plant of *Ixora Williamsii*, 6 feet high by 4 feet in diameter, with 150 heads of bloom. These two collections occupied no less than 30 yards running length in the centre of the tent.

Ten stove and greenhouse plants (amateurs).—J. Leigh, Esq. (Mr. J. Kirk, gr.) was 1st, with *Ixora Fraseri* and *I. Dixiana*, each 4 feet by 4 feet, full of fine trusses. S. Baerlein, Esq. (Mr. G. Williams, gr.), Didsbury, was 2d. Here again were fine *Ixora Prince of Orange*, 4 by 3 feet.

Six stove and greenhouse plants in flower.—The 1st prize was awarded to J. Leigh, Esq.; Mr. Mackellar was 2d.

Five exotic Ferns.—The 1st prize was awarded to S. Baerlein, Esq., who showed *Davallia polyantha* 8 feet through, and several good pieces of the ordinary exhibition species; Mr. Mackellar was 2d, showing amongst others, *Pteris scaberula* and *Alsophila capensis*, in good form.

Zonal Pelargoniums in flower.—These were shown by Mr. J. E. Platt, Cheshire, who was 1st; and Mr. W. Haynes, jun., Sale, 2d.

Four bronze or tricolors were shown by H. Schill, Esq. (Mr. J. Coulson, gr.), 1st, with dwarf plants well coloured; Mr. Deakin, Cheshire, 2d.

A good display of table plants were shown; 1st prize being awarded to J. Hill, Esq., Rochdale; 2d, Mrs. Sykes, Edgeley.

Some splendid Begonias were staged, large in flower, and fortunately had travelled well. Mr. Mackellar was 1st, with three; and H. Schill, Esq., 2d.

D. Adamson, Esq., Didsbury (Mr. J. Briery, gr.), came to the fore with four *Caladiums* well grown and capably coloured; Mr. H. Schill 2d.

Mrs. Deakin was 1st with two pots of *Lilium auratum*; also for four hardy Ferns. In the latter class G. W. Mould, Esq. (A. Macdonald, gr.) was placed 2d, with plants of excellent culture and variety.

GROUPS OF PLANTS IN POTS, NOT EXCEEDING 10 INCHES, INSIDE MEASUREMENT

were shown by both nurserymen and amateurs; in the former Mr. J. Hooley, Edgeley, was 1st, with a very nice group; Messrs. W. G. Caldwell & Sons, Knutsford, coming in 2d. Among the amateurs Mrs. Sykes (Mr. J. Kemp, gr.) was successful, the 2d falling to S. Baerlein, Esq., whose display, though certainly little colour, was very prettily arranged. Six groups were made up in this class.

MISCELLANEOUS.

The latter gentleman was 1st, with six fine-leafage plants, also with twelve bunches of cut stove and greenhouse blooms, H. Schill, Esq., coming 2d;

these two stands contained splendid trusses of *Ixoras*, *Lagerarias*, *Ericas*, *Orchids*, &c.; in one bunch we counted no less than twenty-four fine blooms of *Miltonia spectabilis* roses.

Four *Adiantums*.—W. Hayes, Esq., was 1st, showing clean and healthy specimens; W. J. Parkyn, Esq., 2d.

Mr. J. Draecans—S. Baerlein, Esq., was 1st, Mrs. Sykes 2d; whilst the latter exhibitor was the only one with four pots of *Lilium lancifolium*, and was awarded 1st prize, the plants being strong, and full of bloom.

Celosias, *Cockscombs*, *Petunias*, *Gloxinias*, *Balsams*, were well shown, and in good condition. Cut blooms of *Roses* were shown by Mr. W. Millington and Mr. H. Schill; and *Dahlias* by Mr. J. Warburton and Mrs. Deakin.

Mr. J. Cypher was 1st with a stand for dinner-table decorations, and Mr. D. Adamson 2d.

Some nice bouquets were shown, Mr. S. Baerlein being 1st, Mr. J. Watts 2d.

FRUIT AND VEGETABLES.

Collection of six dishes of fruit.—Mr. Mackellar was 1st, having good Grapes, Peaches, Nectarines, and Melons; Colonel Dixon, Chelford, 2d.

Six dishes of out-of-doors hardy fruit.—Mr. W. Porter, Birkenhead, 1st; Mr. T. Koffey 2d.

Two bunches of Black Hamburgs.—Mr. L. Raynes, Rock Ferry, 1st; Mr. J. Clegg, Chelford, 2d.

Two bunches of black Grapes, not Hamburg.—Mr. L. Raynes 1st, with splendid examples of *Madresfield Court*; Mr. J. Clegg 2d, with *Gros Colmar*.

Two bunches of white Grapes.—1st, Mr. Mackellar; 2d, Mr. J. E. Platt.

Largest bunch of Grapes.—Mr. D. Adamson 1st, Colonel Dixon 2d.

Mrs. Sykes was 1st with one Pine. Mr. G. W. Mould 1st with four dishes of culinary Apples. Mr. S. Lord 1st with white-fleshed Melon; Mr. J. E. Platt being 1st with scarlet-fleshed Melon. Mr. P. Colles was successful with a brace of Cucumbers, Colonel Dixon was 1st with a dish of Cherries and a dish of Peaches. With Nectarines Mr. D. Adamson was 1st; Mr. W. Porter winning with Raspberries, and Mr. Mackellar with dessert Apples.

Grand Tomatos were shown by Mr. J. Mason, Oakfield Nursery, Sale, and were awarded a Special Certificate. For a dish of Tomatos Mrs. Deakin was 1st.

Collections of vegetables, ten varieties.—Of these grand lots were staged. S. Lord, Esq. (gr., Mr. G. Walker), was placed 1st, with a fine lot; Mr. T. Roffey, Sandbach, coming in 2d.

Prizes were awarded to single plants of Orchids, stove and greenhouse plants in bloom, *Liliums*, *Bouvardias*, *Eucharis*, ornamental-berried plants, *Japanese Maize*, *Yucca filamentosa variegata*, and early *Chrysanthemums*.

Stands of cut flowers were shown by several nurserymen, among them being *Roses* and cut blooms of herbaceous plants from Messrs. F. & A. Dickson, Chester; *Dahlias*, *Roses*, *Begonias*, and herbaceous plants, from Mr. J. Robson, Downs Nursery, Bowden; *Roses*, *Gladioli*, &c., from Messrs. Dickson, Brown & Tait, Manchester; also a good lot of a similar character from Messrs. Dickson & Robinson, Market Place, Messrs. W. & J. Mellon, Withington, had *Asters*, *Pansies*, and herbaceous blooms; whilst from Mr. W. Cordingley, Stockport, came beautiful *Gloire de Dijon* and *Niphetos* *Roses*, with *Carnations* and *Picotees*.

Capital groups of plants, not for competition, were staged by Mr. J. Hooley, Edgeley Nursery; Messrs. W. G. Caldwell & Sons, Knutsford; Mr. J. Burket, Heaton Norris; also by Mr. C. Cleave, Heaton Norris; and Mr. W. J. Williams, Heaton Mersey. These added much to the interest and attractiveness of the show.

The energetic and enthusiastic Hon. Secretary, E. D. Stoe, Esq., who is not an exhibitor, but who is a thorough worker, not only deserves support, but has succeeded in enlisting the active co-operation of the leading gentry for miles around, and the hearty aid of a small committee, anxious to promote the objects of the Society, which is the encouragement of horticulture in the cottage, as well as in the gardens of patrons of more extended means and opportunities.

MAIDENHEAD: August 19.

AFTER being suspended for one season the committee of this Society have again, by offering an attractive schedule, brought together an exhibition of first-rate produce. There was throughout the show an absence of inferior productions, and the exhibitors of the district are to be congratulated for the excellent display that was made on this occasion.

PLANTS.

These were characterised by their fresh appearance and the absence of unwieldy specimens. Mr. Aitken, gr. at Richings Park, Slough, was a prominent exhibitor,

taking the leading prize for a group of flowering and foliage plants arranged for effect; these consisted of subjects well chosen for the purpose, and were arranged in a light and elegant manner, *Francoa ramosa* and *Lilies* playing an important part. Mr. Taylor, gr. to J. Watson, Esq., Langley House, Slough, followed closely for the 2d place, with a pretty group, amongst them being some plants of *Crotons* that told well. The 3d prize was awarded to Mr. Elliott, gr. to J. Hibbert, Esq., the President of the Society, in whose grounds the show was held, for a group of bold form, *Gladioli* and *Liliums* being used freely.

Mr. Aitken repeated his former success by winning the 1st prize for six flowering and foliage plants with a well grown set of all-round plants; *Kentia australis*, a noble plant; *Croton Johannis*, finely coloured; and *Allamanda Hendersoni*, in good flower, were the most noticeable among others; Mr. Gates, gr. to Dr. Meadows, Poyle Manor, coming in a capital 2d, with six well grown plants.

Mr. Owen was awarded the 1st prize for six well grown tuberous *Begonias* of an excellent strain.

For a flowering specimen a fine plant in abundant bloom and fresh of *Erica Austriana* was the 1st place for Mr. Taylor; whilst an unusually well-timed example of *Lagerstromia indica*, with quantities of its bright pink panicles of flower, from Mr. Aitken, and a good plant with several spikes of flower of *Peristeria elata* from Mr. Gates, were bracketed equal 2d.

A fine plant of *Croton Queen Victoria* took 1st as a foliage specimen for Mr. Aitken; a healthy plant of *Cycas revoluta* pressing closely for 2d, from Mr. Taylor.

Two good collections of six Ferns were staged, the last named exhibitor winning with a set of well grown plants, among which were a finely developed specimen of *Pteris scaberula* and a *Gymnogramma Lauchiana*; in Mr. Lockie's 2d prize lot was another good *Pteris scaberula*, and a fine specimen of *Adiantum cardiophyllum*.

For eighteen fine-leafage plants in 8 inch pots, a very fresh lot coming from Mr. Wells, gr. to R. Ravenhill, Esq., Wickfield, took the 1st prize.

Several collections of dinner-table plants were staged, the best coming from Mr. Lockie, gr. to Lord Fitzgerald, Oakley Court, Windsor.

FRUIT.

This section constituted an important feature in the large market. Mr. Cakebread, gr. to Sir P. Rose, Raynes, taking 1st for *Muscad* of *Alexandria* finely coloured, likewise for *Madresfield Court* equally good, and for *Foster's Seedling*, in classes provided for *Muscads*, any other black and other white respectively; the same exhibitor being 2d in an exceedingly strong class of *Black Hamburgs*, the 1st prize for these went to a set of three bunches of first-rate colour and berry from Mr. Weiss.

For six kinds of fruit a strong lot came from Mr. Goodman, gr. to C. Hammersley, Esq., Bourne End, who had good Grapes and fine samples of *Oullin's Golden Grape Plum*; Mr. Cakebread came in a close 2d, staging *Muscad Grapes*, again in good order.

In the class of four dishes (*Pines* excluded) Mr. Lockie won with capital fruit, whilst for the same number of dishes, with a dinner-table among which went another 1st with good samples, among which a dish of *Old Windsor Pear*, finely coloured, was conspicuous.

Peaches.—A fine dish of *Stirling Castle* Peaches in perfection won the 1st prize for Mr. Taylor, and an equally fine dish of *Pine-apple Nectarines* won the same position for Mr. Aitken.

VEGETABLES.

For Messrs. Sutton's prizes the competition was exceedingly keen, no fewer than twelve lots of nine dishes each were staged, Mr. Lockie winning the 1st prize with an extra strong lot among which was noticed *Royal Windsor Cucumber*, *Trophy Tomatos*, and *Snowball Turnips*, all finely shown; Messrs. Elliott, Goodman, Cakebread, and Aitken, following each other closely in the order named.

Potatos were shown in quantity in several classes, the tubers being clean, and of a good average size; *Reading Hero* among rounds, and *Reading Ruby* and *Cardinal* of the kidneys, were among the best shown.

Veitch's *Standard Heaver* *Carry*, very fine, won for Mr. Gates the 1st prize, and *Sutton's Perfection Tomatos* the same position for Mr. Cakebread.

CUT FLOWERS.

These were composed of the chief things in season, Mr. Walker, of Thame, being strong in *Asters*, *Dahlias*, and *Zionias*.

For three stands for the decoration of the dinner-table, Miss Temple won with choice material, boldly, yet effectively arranged, being very closely pressed by Mrs. Elliott, who took 2d place with excellent arrangements; these two exhibits were prominent features of the show.

Messrs. Sutton & Sons exhibited a brilliant collection of annuals, &c., not for competition; and Mr. Owen some choice *Gladioli* and *Tuberous Begonias*, &c.

TROWBRIDGE HORTICULTURAL.

In pleasant weather this Society celebrated its thirty-seventh annual exhibition in the usual show ground near the railway station. It is a very popular gathering, and, as is usual, there was a very large and attractive show, probably one of the best ever held in Trowbridge; the tents were full to repletion, and the judges had no easy task in making the awards. The attendance was very large, and over £300 was taken at the gates. It may be stated that the first exhibition was held in order to wipe off a debt on the old Mechanics' Institute, and this proved so successful that a balance of over £100 remained, and this sum was handed over to a committee of townspeople to carry out an annual exhibition, and they have continued to do this ever since. At the present time the Society has a seat of £200. The Hon. Sec., Mr. James Hantley, has filled the post for the large number of twenty-three years.

PLANTS: STOVE AND GREENHOUSE.

Of these there was a good display. Mr. J. F. Mould, nurseryman, Pewsey, being placed 1st with nine good specimens, including three *Ericas*, viz., *Aitonis turgida*, *Marnockiana*, *Austriana*, *Dipladenia amabilis* and *Brievleyana*, *Clerodendron Balfourianum*, *Allamanda Hendersoni* and *nobilis*, and *Ixora Pilgrimii*; 2d, Mr. J. Matthews, gr. to W. R. Brown, Esq., Trowbridge.

With six plants Mr. G. Tucker, gr. to Major W. P. Clarke, was a good 1st with *Stephanotis floribunda*, *Anthurium Schzerarianum* var. *Veitchii*, *Stiscia profusa*, *Konodelia speciosa major*, *Ixora Fraseri*, and *Bougainvillea glabra*; 2d, Mr. H. Pocock, gr. to J. P. Haden, Esq., Trowbridge.

Mr. Matthews had the best three specimens, setting up in good character *Allamanda Hendersoni*, *Ixora Pilgrimii*, and *Erica McNabiana*; 2d, Mr. George Pym, gr. to Mr. Gouldsworth, Trowbridge.

In the class for a specimen plant displaying superior cultivation, Mr. Pym was 1st, with a well grown and flowered piece of *Cattleya Loddigesii*; Mr. F. Perry being 2d, with a good specimen of *Pilumna nobilis*.

The best new or rare plant was *Croton Bergmanni*, shown by Mr. J. Mould; Mr. C. Richman, gr. to G. L. Palmer, Esq., Trowbridge, being 2d, with *Cattleya Dominiana*.

Heaths were rather small, but nicely grown and flowered; Mr. Matthews was 1st, with six specimens, Mr. Mould coming in 2d.

Gloxinias were decidedly good for the late season; Mr. G. Richman was 1st, with six; Mr. J. Hiscox gr. to H. B. Rodway, Esq., Trowbridge, being 2d.

Some small but nicely grown and flowered plants of *Achimenes* were staged, Mr. G. Tucker being 1st, and Mr. H. Pocock 2d.

Here, as elsewhere, tuberous-rooted *Begonias* are rapidly improving as exhibition plants, single and double varieties being well shown, the chief honours being gained by Mr. J. Darbin, gr. to G. Tredwell, Bath; and Mr. A. A. Walters, Bath. The fine specimen *Petunias* usually seen at Trowbridge were again in strong force, trained to wire trellises, and carrying striking heads of capital flowers. Mr. Mattock, gr. to J. G. Coley, Esq., Timpley Stoke, had the best; the Rev. C. C. Lyard being 2d.

Cockscombs were good, Mr. M. Tiley, Bath, having the best.

The best *Verbenas*, trained like the *Petunias*, and making fine exhibition plants, were staged by Mr. Mattock, and the Rev. C. C. Lyard.

Mr. Tucker had the best eight plants of zonal *Pelargoniums*, finely grown and bloomed; Mr. H. Pocock being 2d.

Large and bold specimens are always the rule at Trowbridge. Variegated *Pelargoniums* were also in good condition; Mr. H. Pocock had the best six, and Mr. P. K. Butler, Devizes, the best four specimens. Balsams were fresh and good.

FOLIAGED PLANTS.

The best nine came from Mr. Mould, who was strong in good bushes of *Crotons*, showing five, viz., *Johannis*, *Andreanus*, *Queen Victoria*, *Sunset*, and *Majesticus*, *Cycas revoluta*, *Kentia Fosteriana*, *Cocos Weddelliana*, and *Draena Shepherdii*; 2d, Mr. W. C. Drummond, nurseryman, Bath.

Coleus were numerous and good, well grown and coloured; Mr. J. Matthews had the best six, Mr. Geo. Pym being 2d.

FERNS AND MOSSES

are shown in groups of fifteen, and there is always a very keen competition for 1st honours; on this occasion Mr. Geo. Tucker was awarded the 1st prize; Mr. J. Coke, gr. to A. P. Stancourt, Esq., Trowbridge, being 2d. These groups greatly help the show

and being generally medium-sized, well developed specimens, they take up a good deal of space. *Caladiums* were also in good form: Mr. Matthews was 1st, and Mr. H. Pocock, 2d.

FUCHSIAS.

No praise can be too high for the fine specimens shown by Mr. Matthews on this occasion. It very rarely happens that Mr. Lye cannot show, but from some cause he did not put in an appearance on this occasion. Mr. Matthews' 1st prize six plants, 8 feet in height, and correspondingly broad, consisted of the following dark varieties:—*Charming*, *The Hon. Mrs. Hay* and *Noel's Favourite*; light, *Beauty of Trowbridge*, *Marchioness of Bath* (white corolla), and seedling, 2d, Mr. H. Pocock, with smaller but remarkably well grown and flowered specimens. Mr. Matthews had the best four also, his dark varieties being *Noel's Favourite* and *The Hon. Mrs. Hay*; light varieties, *Rose of Castille* and *Arabella*; Mr. G. Tucker being 2d. The *Fuchsias* shown by amateurs and cottagers, though smaller in size, were perfect as well grown and flowered specimens. Among amateurs, Mr. H. Perkins had the best four; among cottagers, Mr. F. Slads was 1st with the same number of plants.

CUT FLOWERS.

There is always a good show of *Dahlias* at Trowbridge, the Society having made them a speciality for years past. The best twenty-four varieties, single blooms, came from Messrs. Keynes, Williams & Co., Salisbury—a fine lot of flowers, consisting of C. E. Wyatt, Mrs. Gladstone, Prince Bismarck, Henry Walton, Rungway, Muriel, Victor, Illuminator, Harry Keith, Colonel, Imperial, Rosalyn, James Cocker, Bonaquy, Queen, William Rawlings, Henry Bond, Joseph Ashby, Thomas Hobbs, Harry Turner, John Wyatt, Mr. P. Wyndham, Sir C. Mills, Mrs. George Paul, and seedling. 2d, Mr. Thomas Hobbs, Lower Easton, Bristol, with smaller but fairly good blooms.

In the class for twelve varieties, Mr. G. Humphries, Chippenham, was 1st; and Mr. H. Bush, Bath, 2d, with rather small, but fine flowers. 2d, Messrs. Keynes, Williams & Co. had the best twelve fancy varieties, staging *Gaiety*, *Pelican*, seedling, *Heckford*, sport from *Gaiety*, Mrs. Saunders, *Rebecca*, *Hercules*, *John Forbes*, *The Rev. J. E. M. Camm*, *Salamander*, and *Miss Letty Laje*. 2d, Mr. G. Humphries.

The Society's Certificate of Merit was awarded to the following seedling *Dahlias*, shown by Messrs. Keynes & Co.:—*Victor*, rich maroon, very fine form and excellent centre; *Defiance*, pale ruby-scarlet, perfect in petal, centre, and outline; and *Colonist*, fawn, tinted with gold, the petals slightly suffused with magenta, and having a nice edge of magenta-purple: a very novel and distinct flower. Messrs. Keynes & Co. also had *Illuminator*, shaded crimson, the tips of the petals orange and gold, large, full, but somewhat reflexed, yet very bright and novel; *Crimson King*, bright crimson; and *Golden Eagle*, yellow ground, pencilled and edged with crimson-purple—novel and distinct.

Single *Dahlias* were shown in stands of twelve blooms. Mr. A. A. Walters, florist, Bath, was 1st, and Mr. W. J. Jones, gr. to W. J. S. Pope, Esq., Bath, 2d; but a certain number of blooms should be stated in the schedule—some exhibitors had but one of each variety, others had five or six flowers.

The best twelve bunches of pompon *Dahlias* came from Messrs. Keynes & Co.—an excellent lot, consisting of *Dora*, *Catherine*, *Darkness*, *The Khevis*, *Laurie Blanche*, *Royal Golden Gem*, *Gen. E. F. Jungker*, *Favourite*, *White Aster*, and a seedling, red tipped with white.

ROSES.

These were a good feature for the season of the year. The best twelve varieties, three trusses of each, came from Mr. J. Mattock, Oxford, who had *Natrice Bernardin*, *Horace Verneet*, *Merveille de Lyon*, *Duchess of Bedford*, *La France*, *Emile Hauberg*, *Catherine Mermet*, *Madame Victor Verdier*, *Perle des Jardins*, *Navier Olibo*, and *Marie Van Houthe*. Mr. S. P. Budd, Bath, was 2d; and Messrs. Geo. Cooling & Son, Bath, 3d.

With twenty-four single blooms, distinct, Mr. Mattock was again 1st, with good examples of *Horace Verneet*, *Souvenir d'un Ami*, *Alfred Colomb*, *Innocente Priola*, *Dupuy Jamain*, *Le Havre*, *Marie Verdier*, *Duchess of Bedford*, *Charles Darwin*, *Madame Berard*, *Duchess of Teck*, *Catherine Mermet*, *Devienne Lamy*, and *Jean Ducher*. 2d, Messrs. Geo. Cooling & Son; 3d, Mr. H. J. Gibbs, Salisbury.

In the amateur class, Mr. Budd had the best trebles; Mr. G. Warden, the Gardens, Clarendon Park, Salisbury, being 2d.

ASTERS.

Both the quilled and flat-petalled varieties were numerous and fine. Messrs. A. F. Walters, G. Cooling & Sons, and G. Garraway, all of Bath,

appear to have strains of quilled *Asters* of great beauty and variety; they were much superior to anything we have before seen this season.

Hollyhocks, *Gladioli*, *Panics*, *Pelargoniums*, *Carnations* and *Picotees*, *Verbenas*, &c., all in a cut state, were numerous and good.

In the class for twenty-four varieties of cut flowers, Mr. Iggulden, Marston House Gardens, was 1st with a remarkably good stand; Mr. F. Perry, Shirehampton, Bristol, being 2d.

In the amateurs' and cottagers' divisions cut flowers were also remarkably good.

MISCELLANEOUS.

One interesting feature was special prizes for British wild flowers collected within twelve miles of Trowbridge, and botanically named. Mr. John Sheldall, Combe Hay, was 1st, with an excellent collection; Miss Mann, Trowbridge, being 2d.

Collections of hardy annuals, in twelve varieties, for which special prizes were offered, were also well shown.

Table decorations of garden and also of wild flowers, bouquets, memorial wreaths, and button-holes, were in excellent character; indeed, the cut flower classes, most of themselves, have made an exhibition of an extensive and superior character; owing to such a large increase in the number of entries, they were inconveniently crowded.

FRUIT.

The fruit department was the only one in which the show may be said to have shown a falling off. The best collection of ten dishes, Pine excluded, was shown by Mr. A. Miller, gr. to W. H. Long, Esq., M.P., Road Ashton, Trowbridge, who had very good Black Hanburgh and Foster's Seedling Grapes, *Violette Hative* and *Hale's Early Peaches*, *Elrage Nectarines*, *Moore Park Apricots*, *Brown Turkey Figs*, and two varieties of Plums; 2d, Mr. H. Prosser, gr. to A. Laverton, Esq., Westbury, whose collection was a poor one compared with Mr. Miller's, but the 2d prize, being low in amount, it was awarded.

Some good Grapes were staged. In the class for any Black, not Muscat, Mr. C. Warden, gr. to Sir F. H. Bathurst, Bart., Clarendon Park, Salisbury, was 1st, with very good Black Hanburgh; Messrs. D. Evry & Sons, Bath, being 2d, with Alicante.

The best two bunches of white Grapes, not Muscats, were Buckland Sweetwater, from Mr. A. Young, gr. to A. Thomas, Esq., Clifton, Bristol; Mr. Iggulden being 2d, with Foster's Seedling, nicely turned out, but a little small in berry.

In the class for Black Muscats Mr. H. Clark, Roundway Park, was 1st, with fairly good *Madresfield Court*; Mr. Iggulden being 2d with the same variety. The last named had the best two bunches of White Muscats, good alike to bunch and berry; Mr. J. Loosemore, gr. to W. Cowper, Esq., Clifton, being 2d.

Mr. Thomas King, gr. to R. Valentine Leach, Esq., Devizes Castle, was 1st, with a dish of six *Peaches*, staging excellent *Dr. Hogg*; Mr. T. Keevil, Bockington, being 2d, with *Barrington*.

The best dish of six *Nectarines* came from Mr. Iggulden, who had excellent fruit of *Laird Napier*; 2d, Mr. Thomas King, with *Balgowan*.

Melons were well shown, but did not call for any special remark.

The Rev. C. C. Lyard had the best dish of *Moore Park Apricots*; Mr. G. Tucker being 2d.

A good number of Plums were shown, among them some excellent fruit of *Green Gate*; Mr. G. Garraway being 1st, and Mr. M. Tiley, Bath, 2d.

Culinary Apples were very good indeed, the leading sorts being *Lord Suffield*, *New Hawthorn*, *den*, *Empress Alexander*, *Warner's King* and *Tower of Glamis*. Dessert Apples were decidedly good.

The best dessert Pears were represented by *Jargonelle*, *Williams' Bon Chretien*, *Windsor*, and *Muirfowl's Egg*.

The best table decoration, composed of fruit and flowers, came from Mr. E. T. Hill, Westbury.

In the cottagers' department hardy fruits were extensively and nicely shown.

The show of vegetables in all the divisions a large one; so largely were they contributed that it was difficult to find room for them. Mr. A. Miller had the best collection of nine dishes; Mr. Thomas Evry, Bath-easton, being 2d.

In the gardeners' division Cucumbers, Cauliflowers, Potatoes, Onions, Peas, Carrots, Parsnips, Celery, Turnips, Cabbages, French Beans, Marrows, and herbs were in rare form.

In the cottagers' tent the display was even more striking. One class was for a basket of Potatoes of various kinds. One cottager had a collection of thirty-eight varieties in a long shallow box; another had one with nearly thirty varieties, many, it to be feared, unworthy the garden room afforded them. Potatoes in single dishes of half a peck were seen to the best advantage. The leading coloured round varieties were—*The Dean*, *Vicar of Laleham*, *Reading Russet*, and *Emporer*; the leading coloured kidneys—*Prize*

taker, Reading Ruby, Beauty of Hebron, and Wonder Red. The leading white round was Schoolmaster; and of white kidneys—Chancellor, Woodstock Kidney, and International. The judges must have had a heavy task, and they well deserved the luncheon given them by the committee at the close of their arduous labours.

BASINGSTOKE HORTICULTURAL:
August 19.

The tenth annual exhibition of the above Society was held in "The Goldings," a space specially well adapted for a flower show. The show on the whole was a capital one, the only classes which showed any falling off were one or two devoted to plants, owing to possible exhibitors being at other shows. Still there was enough to make an attractive exhibition. Black Grapes were excellent, while the vegetables in all the classes were of very superior character, particularly the collection of twelve in the open class. Cut flowers were of much merit, and the various epergnes, &c., were dressed with much taste.

PLANTS.

The principal class for plants was that where the 1st prize was given by the President, W. W. Beach, Esq., M.P., for a collection of twelve to be either in or out of bloom. Mr. Bowman, gr. to C. Hoare, Esq., Hackwood, was placed 1st, with a freely flowered specimen *Eucharis amazonica*, *Allamanda Hendersoni*, a healthy *Cycas revoluta*, and a well coloured *Croton Veitchii*, as his best; Mr. J. Dancey, gr. to J. B. Stone, Esq., Buckfield, was 2d, his best being *Cocos Weddelliana* and *Allamanda Schottii*.

A special class, provided by Major J. May, for gardeners in smaller places than the preceding class, brought out even better specimens than did the former, the conditions being the same. Mr. B. Tripp, gr. to S. Field, Esq., Goldings, easily carried off 1st honours with *Latania borbonica*, of good size and healthy; *Areca lutescens*, and a richly flowered and nicely coloured specimen of *Clodendron Balfourianum* as his best plants; Mr. Thompson, gr. to Captain Boland, Down Grange, was 2d, he also having clean healthy plants.

Single specimens were freely shown, Mr. Bowerman taking the lead with *Eucharis amazonica*, in capital condition; 2d, Mr. T. Weaver, gr. to W. W. Beach, Esq., M.P., Oakley Hall, Basingstoke; while three equal 3d prizes were also awarded.

Mr. Weaver staged the best exotic Ferns, his six specimens being all in the best health possible; Mr. Bowerman 2d, Mr. Thompson 3d.

GROUPS.

For the best group, arranged for effect, Mr. Weaver was easily best; the plants used were of a rather larger size than those generally chosen for the like purpose, still they were used judiciously, and all were in capital condition; some fine plants of *Panacratium* fragrans, in small pots, with one immense spike to each, made a feature in this group, which was neatly margined with *Caladium argyrites* and Maidenhair Fern. Mr. B. Tripp, gr. to S. Field, Esq., was 2d, but his plants were arranged too flatly, giving the group a too even appearance; otherwise the plants were in capital condition for the purpose. 3d, Mr. T. Holdaway, gr. to Major J. May.

CUT FLOWERS.

Asters were in strong force, both the quilled and the plain sections. For the former Mr. Kneller, gr. to W. S. Portal, Esq., Malshanger, was 1st, staging Betteridge's varieties in good condition; 2d, Mr. Lye, gr. to W. H. Kingsmill, Esq., Lydmonton, 3d, Mr. Thompson.

Mr. Kneller was again 1st, staging good flowers in the plain-flowered section.

Mr. Bowerman had the best twelve bunches of cut flowers, which included good *Ixoras*, *Lapagerias*, and *Stephanotis*.

FRUIT.

The best collection of eight varieties was staged by Mr. Weaver, his best dishes being Buckland Sweet-water and Black Hamburg Grapes, La Favorite Melon, and excellent Morello Cherries; 2d, Mr. Thompson.

For the best six dishes, Pines excluded, Mr. Jones, gr. to H. Harris, Esq., Steventon, Basingstoke, who had good Black Hamburg and Foster's Seedling Grapes, Pine-apple Nectarines, Morello Cherries, and Jargonelle Pears; 2d, Mr. G. Best.

For these bunches Black Hamburg Grapes, Mr. Bowerman was easily 1st, staging excellent samples, large both in bunch and berry and well finished; 2d, Mr. Jones, equal in quality, but lacking a trifle in size; 3d, Mr. Weaver.

For three bunches any other Black Mr. Best was 1st, with very fine Black Prince; 2d, Mr. Jones; and 3d, Mr. Lye.

Mr. Weaver staged the best three bunches of white

Grapes, Muscats excluded, with Buckland, Sweet-water, good; both in berry, bunch, and colour; 2d, Mr. Kneller, with bunches having larger berries, but not so well coloured; 3d, Mr. G. Best. Mr. Dancey had the best green-flesh Melon and Nectarines, while the best scarlet-flesh Melon and Plums were staged by Mr. Bowerman.

VEGETABLES.

The best collection of twelve varieties was staged by Mr. Bowerman, and grand they were, so clean were the samples, it would be difficult to surpass them as a whole; Mr. Dancey followed with an excellent collection; 3d, Mr. Lye. Mr. Dancey had the best collection of nine varieties of Potatoes, medium sized, even, clean samples. In the class for spring sown Onions, some extra good Rousham Park were shown by Mr. Kneller for 1st prize.

Messrs. Suttons, an excellent set of cut flowers of annuals and perennials, which were much admired.

NARBOROUGH, ENDERLEY AND DISTRICT HORTICULTURAL.

The fifth annual show was held on Thursday, August 19, when the exhibits were pronounced by the judges to be above average. The weather was most unfavourable, and as a consequence a heavy loss falls upon the Society. Some excellent Roses were shown by Messrs. Perkins & Sons, of Coventry, and Mr. Frettingham, of Beeston Nurseries, Nottingham. Mr. Warner also sent some fine Dahlias and Roses for non-competition. The cottagers' class was excellent, and the vegetables and fruit of the other classes very fair for the season. Mr. Redford, gr. to J. G. Simpkin, Esq., showed some very fine Grapes. A special prize, given by Messrs. Harrison, seedsman, of Leicester, for Potatoes, drew forth a strong competition, and the exhibits were admirable. Mr. Davies, gr. to Captain C. G. Drummond, of Enderby Hall, and Mr. J. Exton, gr. of Narborough Hall, staged some plants, &c., for non-competition. H. L.

Obituary.

ROBERT LORD.—Cultivators of the Carnation and Picotee, and especially those who are exhibitors at the three leading exhibitions held annually, will learn with pain of the death of Mr. Robert Lord, of Hole Bottom, Todmorden, which took place on the 18th inst., after a brief illness. Mr. Lord, who had been for the annual meeting of the Carnation and Picotee Union—of which he was a promoter and active supporter—at Oxford on the 3d inst., unhappily contracted a chill on his return journey, which resulted in inflammation of the brain and death.

Mr. Robert Lord was born at Todmorden on January 2, 1818, and he commenced growing Carnations and Picotees at the age of fourteen, and subsequently cultivated the Tulip, show Auricula, Pink, Pansy, Dahlia, &c., but latterly, Carnations, and Picotees and Auriculas only were grown by him. But he was a representative florist in the best sense of the term. Trained to the sister art of music—for up to the year 1880 he followed the profession of a teacher of singing—having in the prime of life an excellent tenor voice, which placed him in the front rank of local musicians; gifted with a keen sense of the beautiful, a rare power of accurate observation, his work was of the highest order, and his judgment solid and matured, in him florists had an example worthy of all admiration. He had made Hole Bottom—a strange misnomer for a site 600 feet above the immediate valley, but it was an old disused quarry—an historic name for the beauty of its productions; and as he lay so near to his end his flowers were obtaining 1st honours as recorded in our last week's report, at the annual exhibition of the National Carnation and Picotee Society (Northern Division) at Manchester on the 14th inst.

Mr. Lord was the raiser some ten years since of a batch of beautiful Picotees, which hold, and are likely to continue to hold, so long as they can be grown, a first place in the estimation of the intelligent florist. Writing of one of these—Zerlina—in his descriptive list, recently published, Mr. Dodwell says:—"Last upon my list, but amongst the very first in my regard, from the same pod of seed with Alice, Ann Lord, Minnie, and Fanny, it is impossible, as I have previously said of these flowers, to exaggerate their excellence or over-exalt their quality. Raisers in all generations may strive, as they assuredly will, and they may develop new forms and shades of colour, or combinations of colour; but

they will never surpass the richness of quality, stoutness of substance, distinctness of markings smoothness of edge and surface, symmetry of form, or breadth of petal which distinguish them and other fine varieties. No one with even a smattering of knowledge of the wonderful diversity possible to Nature, and the beauty to be found in her productions, could think of putting a limit to her power, but in the directions indicated, it may be permitted for the fruit to speak with confidence." He also raised rose-faked Carnation Mrs. Dodwell; and the following Picotees in addition to those named:—Red F. D. Horner, Nymph, Cynthia, Miss Lord, Miss Lee, and Mrs. Lord. His old and attached friend, Mr. E. S. Dodwell, named after him one of the best scarlet bizarres he has raised.

About five years ago Mr. Lord commenced business as a grower of Carnations and Picotees in conjunction with his son Tom, by whom, in conjunction with his family, the business will be carried on in the future. This season they have fully a thousand pots contain 3000 to 4000 plants.

For many years he was the choir-master of the Musical Union, and afterwards of the Musical Society of Todmorden. He also taught singing in the Messrs. Fieldens' Schools, and for a long period of forty-three years he was choir-master at the Unitarian Chapel, R. D.

The Weather.

STATE OF THE WEATHER AT BLACKHEATH, LONDON FOR THE WEEK ENDING WEDNESDAY, AUGUST 25, 1886.

- Aug. 19.—A very dull day, the air nearly saturated with water.
- 20.—A fine day.
- 21.—A very fine day.
- 22.—The morning was dull, afterwards fine and bright.
- 23.—A fine day.
- 24.—A fine warm day.
- 25.—A fine day throughout, at times close and warm.

LONDON: Atmospheric Pressure.—During the week ending August 21, the reading of the barometer at the level of the sea increased from 30 inches at the beginning of the week, to 30.17 inches by the morning of the 15th, decreased to 29.87 inches by 9 P.M. on the 16th, increased to 30.25 inches by 9 A.M. on the 20th, and was 30.03 inches at the end of the week.

The mean reading of the barometer for the week at the level of the sea was 30.11 inches, being 0.22 inch higher than last week, and 0.13 inch above the average of the week.

Temperature.—The highest temperature in the shade in the week was 73° on the 21st; the highest on the 18th was 62°. The mean of the seven high day temperatures was 66°.9.

The lowest temperature in the week was 48° on the 21st; the on the 16th was 56°. The mean of the seven low night temperatures was 51°.6.

The greatest range of temperature in one day was 25° on the 21st; the smallest was 10° on the 16th and 19th. The mean of the seven daily ranges was 15°.3.

The mean daily temperatures were, 60°.8 on the 15th; 61° on the 16th; 57°.4 on the 17th; 57°.7 on the 18th; 58°.5 on the 19th; 58°.4 on the

20th; and 66° 3 on the 21st. These were all below their averages by 0° 9, 0° 4, 3° 8, 3° 3, 2° 4, 2° 4, and 0° 4 respectively.

The mean temperature of the week was 59° 2, being 1° 5 lower than last week, and 1° 9 below the average of the week.

The highest reading of a thermometer with blackened bulb in vacuo placed in full rays of the sun was 126° on the 16th. The mean of the seven readings was 110° 7.

Rain fell on 2 days to the amount of 0.19 inch.

ENGLAND: Temperature.—During the week ending August 21, the highest temperatures were 77° 1 at Cambridge, 74° at Sunderland, and 73° at Truro, Bristol, Blackheath, and Newcastle; the highest at Preston was 69°, at Liverpool 69° 2, and at Bradford, 70° 2. The general mean was 71° 8.

The lowest temperatures were 42° 1 at Wolverhampton, 43° at Hull, and 45° at Truro; the lowest at Bradford was 52° 8, at Bristol 52° 8, and at Liverpool 51° 6. The general mean was 48° 1.

The greatest ranges were at Cambridge 31° 6, at Wolverhampton 29° 5, and at Hull 29° 1; the least ranges were 17° 4 at Bradford, 17° 6 at Liverpool, and 18° at Preston. The general mean was 23° 7.

The mean of the seven high day temperatures was highest at Cambridge 71° 4, at Brighton 69° 2, and at Leeds 68° 1; and lowest at Newcastle 63° 6, at Liverpool 64° 5, and at Sunderland 65°. The general mean was 67°.

The mean of the seven low night temperatures was highest at Bradford, 56°, at Preston, 55° 8, and at Liverpool, 55° 7; and was lowest at Wolverhampton 50° 1, at Hull 50° 4, and at Cambridge 50° 8. The general mean was 53° 3.

The mean daily range was greatest at Cambridge, 20° 6, at Brighton 16°, at Wolverhampton 15° 8; and was smallest at Liverpool 8° 8, at Bradford and Newcastle 10° 1. The general mean was 13° 7.

The mean temperature was highest at Brighton 59° 5, at Plymouth, Cambridge, Sheffield, Leeds, and Sunderland, 59° 4; and was lowest at Wolverhampton, 56° 3, at Hull, 56° 6, and at Newcastle 56° 8. The general mean was 58° 6.

Rain.—The largest rain fall was at Cambridge, 4.76 inch, at Sunderland 1.15 and at Hull 1.11 inch. The smallest falls were 0.19 inch at Plymouth and Blackheath, and 0.24 inch at Brighton. The general mean fall was 0.63 inch.

SCOTLAND: Temperature.—During the week ending August 21st, the highest temperature was 75° at Aberdeen, the highest at Greenock was 69°. The general mean was 79° 8.

The lowest temperature in the week was 39° at Aberdeen; at Dundee the lowest was 49° 7. The general mean was 43° 5.

The mean temperature was highest at Edinburgh, 58° 9; and lowest at Glasgow, 57°. The general mean was 57° 6.

Rain.—The largest fall was 0.78 inch at Greenock, and the smallest was 0.06 inch at Edinburgh. The general mean fall was 0.27 inch.

JAMES GLAISHER, F.R.S.

Enquiries.

"He that questeth much shall learn much."—BACON. "JUMPING BATTLE."—My employer has just informed me of a plant under the above name, which was growing in his Berkshire gardens so long ago as fifty years; presumably a herbaceous plant, having pods somewhat like largest of peas, only very much smaller, and nearly transparent when ripe, and which when pressed between the finger and thumb at that stage of growth instantly vanished with a little puff, and leaving not a particle of the pod behind! I shall feel much obliged if any of the readers of the Gardeners' Chronicle can give me any information about this plant—the name, &c.—if they are able to recognise it from the particulars herein given of what appears to be a very curious plant. H. W. W.

Answers to Correspondents.

ALEXANDRA NOBLESSE AND ALEXANDER PEACHES: G. S. We are not aware that there is any difficulty in fruiting these varieties. The first-named, which was raised by Mr. Rivers, is not subject to mildew, as is the old Noblesse. In case of these being shy bearers in a house it would be advisable to plant some variety which sets freely in the same house; insects and wind would then carry the pollen from one to the other, and thus effect a certain "set." The flowers of the Marguerite seem to be injured by wet.

BEGONIAS: G. Stowell. They are pretty, but no better than scores of seedlings raised at the nurseries.

BOOKS: H. J. C. Hentley's Elementary Course is the most comprehensive book of its class. The Physiology you mention must be quite out of date. We do not know the requirements of the examination you mention, but we strongly advise you not to trust to book-knowledge, but to make yourself practically acquainted with your subject as far as you can. Practical knowledge with most examiners gets a good deal further than mere cram.

CARNATIONS: D. S. Good border sorts—the yellow one is beaten by Pride of Penhurst, for colour and continuous blooming. Any kind like yours that needs no sticking is an acquisition.

ERRATUM.—In our last number, p. 248, col. c. Messrs. J. Dickson & Sons were stated by our correspondent to be of Upton Nurseries, instead of Newton.

ESPARTO GRASS: H. de V. See Sporn's Encyclopaedia of Industrial Arts, Division III., p. 979 (Spina, 66, Charing Cross). Messrs. Vilmoren, of Paris, could probably supply seed.

EUCHARIS: Anon. The bloom is very large. You will be lucky if you secure it constant.

FUNGUS: G. P. R. The common Stinkhorn (Phallus impudicus).

INSECTS: Camille. We have no experience in drying wasps' grubs for food for birds, and can give no reason why they have turned unusually red when dried in the oven. I. O. W.

NAMES OF PLANTS: G. & J. L., who send seventeen specimens for naming, should show some energy on us, and remember what an expenditure of time—and, in many instances, money—is involved in naming plants, and which is no part of our business, as Editors, though we like to oblige our correspondents so far as we can. We name as many as we can off-hand, and must request that another time no more than six specimens be sent at a time.—1, Thalia gigantea; 2, Juniperus; 3, Chamaecyparis obtusifolia; 4, Cephalanthus drupacea; 5, Sedum reflexum, monstrosus form; 6, Sedum Aizoon; 7, Sedum Anacampseros; 8, Sedum rupestre; 9, Saxifraga; 10, Geranium sanguineum; 11, Geranium sp.; 12, Sedum Telephium; 13, Sedum spurium; 14, Fuchsia melanica; 17, Picea excelsa var. danubiansiliana; 18, a dwarf variety of the Silver Fir, or perhaps the form known as A. Hudsoni.—T. S. S. 1, Lonicera sp.—send them in flower; 2, Ulmus campestris var. pendula; 3, Corymbium Medicago scutellata, commonly called "Stink"; 4, R. M. The plant you call Cornish is known to us as Venus' Comb, Scandex pecten venenis, a cornfield weed. The shrub is Platanus acrifolia, probably from an old stub or layer.—K. L. Lysimachia vulgaris.—W. F. E. Echinosps sphaerocarpus.—H. J. C. 2, Triticum repens; 3, A. caespitosa; 6, Scirpus silvaticus. Other labels detached, but we find among the specimens Bromus asper and a Triticum like T. pungens.—F. M. Athyrium filix-femina var. Verticillata. It should have been sent flat, not like a wisp of hay.—J. G. So far as we can tell from the leaves your plant is Chrysanthemum nigrinosum; see figure in our present issue; but its flowers are white not yellow.—Lilium, 1, leaf not recognised; 2, Escallonia macrantha; 3, Campanula sp.; 4, the double form of Lilium candidum.

PALMS: J. C. Shadwell. The Palm foliage is bleached by tying it up whilst growing—bleaching it, in fact, as Celery is rendered fit for the table, by depriving it of light.

PEAS: W. G. H. Will report on them next week.

PRIVET HEDGE, COPPER BEECH, AND BIRCH: H. C. Stown. The trenching was very deep, and you ought to have waited a whole year before planting. As it will doubtless sink still more, and as burying up the stems—as you would do by filling up the trench—would prove injurious to the Beech and Birch trees, if not to the Privet, replanting would be advisable. If the work be done in the latter part of October, the plants will get scarcely any check from the operation. The trench should be filled up some 3 or 4 inches above the surrounding ground-level, and the soil, when dry, should receive a good tamping before being planted.

SOLANUM LACINIATUM: H. E., Ryde. The Potato disease, without doubt.

YELLOW-FLOWERED CHRYSANTHEMUM: W. Watson. The colour is bright, and it will be valued for its earliness.

WORM: D. Hutton. Smashed in transit.

Markets.

COVENT GARDEN, August 26.

[The subjoined reports are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list weekly, and are responsible for the quotations. It must be remembered that these quotations are averages for the week preceding the date of our report. The prices fluctuate, not only from day to day, but often several times in one day, and therefore the prices quoted as averages for the past week must not be taken as indicating the price at any particular date, still less can they be taken as guides to the price in the coming week. En.]

OUR market remains as last week, with supplies heavy, especially Plums. James Webber, Wholesale Apple Market.

FRUIT.—AVERAGE WHOLESALE PRICES.

Table with 2 columns: Fruit and Price. Includes Apples, Cherries, Currants, Figs, Grapes, Kent Filberts, Lemons, Melons, Peaches, Pears, Pine-apples, St. Michael, Plums.

VEGETABLES.—AVERAGE RETAIL PRICES.

Table with 2 columns: Vegetable and Price. Includes Artichokes, Aubergines, Beans, Beet, Broccoli, Cauliflowers, Celery, Cucumbers, Endive, Herbs, Lettuce, Potatoes, Mushrooms, Mustard, Onions, Parsnips, Spinach, Tomatoes, Turnips, Veget. Mar., Mint, Green, Bunch, Mushrooms, Mustard, Onions, Parsnips, Spinach, Tomatoes, Turnips, Veget. Mar.

POTATOES.—All markets 10s. per cwt. lower.

PLANTS IN POTS.—AVERAGE WHOLESALE PRICES.

Table with 2 columns: Plant and Price. Includes Aralia Schottii, Balsams, Begonias, Bougainvillea, Calceolarias, Cockscombs, Cyperus, Geraniums, Euonymus, Ferns, Ficus, Geraniums, Poinsettias, Pelargoniums, Rhodanthodes, Solanum, Yucca, Foliage Plants, Fuchsias, Geraniums, Hydrangeas, Lilies, Lobelias, Marguerites, Mignonette, Myrtles, Palms, Pelargoniums, Petunias, Rhodanthodes.

CUT FLOWERS.—AVERAGE WHOLESALE PRICES.

Table with 2 columns: Flower and Price. Includes Arum Lilies, Aster, Carnations, Carniflowers, Daisies, Gardenias, Eucharis, Bougainvillea, Myosotis, Gardenias, Gladioli, Heliotropes, Jasmine, Lavender, Lilium longiflorum, Lilium, Marguerites, Pyrethrums, Rhodanthodes, Roses, Sweet Peas, Sweet Sultan, Tulip, Tulseroses.

SEEDS.

LONDON: August 25.—Messrs. John Shaw & Sons, seed merchants, of 37, Mark Lane, E.C., report a moderate amount of business passing in those articles required for autumn sowing. New English and French Trifoliums continue in active request at Monday's figures. The late variety seems in greater favour this season. Supplies of white Mustard are almost exhausted, and full prices are consequently obtained for the few lots on hand. Rye and winter Tares are now being inquired for, but few good parcels are offering. For seed of Hemp and Canary seed more money is asked. Feeding Linseed has a firmer tendency.

CORN.

MARK LANE: Aug 23.—To-day an advance in Wheat of 6d. over last Monday's rates was mostly paid, and some foreign Wheats were held for 1s. rise, but which was very rarely obtained. Common flour was 6d. dearer, and American 3d. to 6d. Grinding Barley ruled fully steady. Beans and Peas were quoted 6d. dearer on the week. Common Oats were less firm, but sales were not forced at any decline, and good qualities brought extreme rates.

Aug. 25.—The market this morning opened firm all round. A very restricted business was done in Wheat, and Monday's rates were not exceeded. The flour trade ruled quiet at previous rates. Barley, Beans, and Peas were quite firm, with moderate sales. Oats showed no quotable change.

Average prices of corn for the week ending August 21:—Wheat, 32s. 7d.; Barley, 22s. 4d.; Oats, 21s. 6d. For the corresponding period last year:—Wheat, 33s. 5d.; Barley, 22s. 6d.; Oats, 20s. 11d.

FLOWERS AT CHRISTMAS.

SUTTON'S BULBS FOR EARLY FORCING

ROMAN HYACINTHS—SINGLE WHITE, finest selected. SINGLE BLUE. EARLY NARCISS—DOUBLE ROMAN. PAPER-WHITE.

"The Bulbs you sent me are splendid. A more perfect lot it would be difficult to find."—Mr. A. DREWERY, Gardener to A. H. Easten, Esq., Patrington.

HILL AND SMITH'S BLACK VARNISH
for Preserving Ironwork, Wood, or Stone.

Oil Paint no Longer Necessary.
HILL AND SMITH'S BLACK VARNISH
for Preserving Ironwork, Wood, or Stone.

This VARNISH is an excellent substitute for oil paint or any other work, while it is fully two-thirds cheaper. It was introduced upwards of forty years ago by the Advertisers, and its genuine good quality, notwithstanding a host of unprincipled imitators, is fully attested by its constantly increasing sale. It may be applied by an ordinary labourer, requiring no mixing or thinning, and is used as it is. It is used in the grounds at Windsor Castle, Kew Gardens, and at the seats of most of the Nobility and Gentry, from whom the most flattering testimonials have been received.

Sold in Casks of about 30 gallons each, at 1s. 6d. per gallon, at the Manufactory, or 1s. 8d. per gallon carriage paid to any Station in the Kingdom.

UNSOLICITED TESTIMONIAL.
From ALFRED LEWIS, Esq., *The Eyres, Alderley Lodge.*
"Some twenty years ago I used your Black Varnish, and shall be glad if you will forward me a cask, as I consider it the best thing known for the preservation of all outdoor work, either wood or iron, that requires to be painted."
CAUTION.—Hill & Smith would particularly warn their Customers against the various cheap Varnishes now so much advertised.

Every cask is legibly marked with their name and Registered Trade Mark as above, without which none is genuine.

Large Illustrated CATALOGUE on Fancy Articles, Field and Entrance Gates, &c., sent free on application to

WARNER'S Celebrated AQUAJECTS.
Two Prize Medals awarded Calcutta Exhibition, 1884:—
Very easy to work, and the best implement of its type.

JOHN WARNER AND SONS, Hydraulic and Horticultural Engineers, The Crescent Foundry, Cripplegate, E.C.; and The Foundry Works, Walton-on-the-Naze, Essex. To be obtained of every Ironmonger and Plumber in the Kingdom.

Unsolicited Testimonial
"In use 20 years—it may be long superior—Mr. Weston-super-Mare, T. J. WARNER & SONS, London."
April 17, 1886.
From W. HOOKER, Esq., Stephen's Row, Seedsman, Nurseryman and Florist, Gentlemen,—I have sent per rail an Aquaject I wish thoroughly repaired except the sprayer, I do not want that attached. *These had in use constantly for just 20 years, with very little repairs, which speaks well for it, and I think by thoroughly repairing now, it may last 20 more.* Yours respectfully,
(Signed) W. HOOKER.

BOULTON & PAUL, NORWICH.

LAWN WATERING MACHINE.
With Powerful Garden Engines, combined.

This implement is most useful in large gardens; is fitted with valve and sprayer for distributing water or liquid manure. Waterpots and pails can be filled when sprayer is in use.

HOLLOWAY'S OINTMENT and PILLS.—Rheumatism and Gout.—These purifying and soothing remedies deserve the earnest attention of all persons liable to Gout, Sciatica, or other rheumatic Affections, Muscles, Nerves, and Joints. The OINTMENT should be applied after the affected parts have been patiently fomented with warm water (when it should be thickly and gently rubbed upon the adjacent skin, unless the friction causes pain). The PILLS should be administered simultaneously taken to Diminish Pain, Reduce inflammation, and Purify the Blood. This treatment abates the violence, and lessens the frequency of Gout, Rheumatism, and all Spasmodic Diseases which spring from hereditary predisposition, or from any accidental weakness of constitution. The Ointment checks the local malady while the Pills restore vital power

MODERATE CHARGES FIRST-CLASS WORK THE BEST MATERIALS.

THE NEW PATENT TUBULAR
COMBINATION STAKE AND CLIP,
 For Trees, Roses, Dahlias, &c.
 (CARTWRIGHT'S PATENT)

THIS PATENT STAKE AND CLIP is at once simple, effective, durable, economical, and safe. It does away with the necessity of tying with string or grass; and when once the tree is fixed in position it is utterly impossible for it to get loose again by the action of the wind or weather; in fact, it must remain fixed in position until the gardener himself loosens it. Does not harbour insects and their eggs as do string and cloth.
 The Stake itself is a wrought-iron tube, and is made in various lengths, from 3 feet up to 7 feet 6 inches.
 The Spring Clips are supplied in various sizes, of 1, 1½, and 2 inches across the ring when shut, and are coated with soft indiarubber.
 Light Brass Caps are also supplied when required. These Caps are fixed on the top of the tube to keep the rain and earwigs, &c., from getting in it.

We can also supply these

STAKES ADAPTED FOR RASPBERRY CANES
 WHEN GROWN IN CLUMPS.

These Stakes are supplied with two large Wire Clips, one on each side of the Stake, as shown in sketch.

MAY BE OBTAINED FROM ALL SEEDSMEN, &c.

Wholesale from **CORB, SOPER, FOWLER & CO. (Limited),** London; **OSMAN & CO.,** London; **BENJAMIN FIELD, Swan Place, Old Kent Road, London, S.E.;** or, from the Manufacturers **The PLASKYNASTON TUBE COMPANY (Limited), Ruabon.**

GREENHOUSES, VINERIES, RANGES, CONSERVATORIES, FORCING HOUSES, &c.

Constructed with the latest horticultural improvements to the most artistic designs, of the best materials, at the lowest prices. THE EFFICIENCY OF ALL WORK, INCLUDING BOILERS AND HEATING APPARATUS, GUARANTEED. Illustrated Catalogues, Designs, Plans and Estimates free of charge.

JOHN SHAW, Jun., Bulb Importer and Seed Merchant, 10, The Downs, Bowdon, Cheshire.

A. B. C. BULB GUIDE.

Prepared with very much care, containing much reliable information upon Bulbs generally, including the following families:—

HYACINTHS, TULIPS, CROCUS, SNOWDROPS, CHIONODOXAS, GLADIOLUS, &c.

Very extensive lists of varieties of these are included, consisting of nearly every variety which can be considered worth growing.

IRIS.—Of these I hold one of the finest collections in the world. Six pages are devoted to this family alone.

HELLEBORES, or CHRISTMAS ROSES are a great specialty at Tottenham. The collection is very complete, and the plants are exceptionally good. I have thousands of fine, strong, healthy clumps of the varieties *major*, *maxima*, *caucasicus*, *Madame Fourcade*, and many others.

DAFFODILS and LILIES

constitute Part II. of my Bulb Catalogue, Twenty-six pages being devoted to them. Both families are cultivated by me most extensively, my collection including almost every variety in cultivation. These have been shown most extensively during the present season at the **Great London Shows**, and have been very much admired, and have done much to assist in securing for me the many **Awards** it has been my pleasure to receive.
 Copies of this most complete and interesting Catalogue may be had gratuitously upon application to

VICTORIA and PARADISE NURSERIES,
 UFFER HOLLOWAY, LONDON, N.

The *Daily Telegraph* of August 20, 1886, in a Leading Article, states:—"Tomato growers in the Channel Islands seem in a fair way of making fortunes. There is no doubt the time is near when the market will be as well supplied with Tomatos all the year round as Cucumbers."

THE GUERNSEY AND JERSEY FRUIT AND PRODUCE COMPANY, LIMITED.

Registered under the Joint Stock Companies' Acts, 1862 to 1883, whereby the liability of the Shareholders is limited to the amount of their Shares.

CAPITAL £20,000, IN 4,000 SHARES OF £5 EACH.

First Issue of £15,000 (3,000 Shares) without premium, a number of which have been already taken up privately. Payable £2 10s. on Allotment, and it is not intended at present to call up more than £2 10s. per Share.

LONDON BANKERS—CAPITAL and COUNTIES BANK, Head Office and Jersey.
 GUERNSEY BANKERS—COMMERCIAL BANKING COMPANY, 11 High Street.
 LONDON OFFICE—4, Tokenhouse Buildings, Bank of England. GUERNSEY OFFICE—Glasshouses and Vineries, Courtil de Jacques.
 MANAGER—HENRY DE JERSEY. SECRETARY—EDWARD OXENFORD PRESTON.

THE GUERNSEY AND JERSEY FRUIT AND PRODUCE COMPANY (LIMITED) has been established for the purpose of growing Fruit and the Produce generally of the Channel Islands, and also for Receiving such Produce from Growers and Supplying the same direct to Consumers and Retail Establishments. The Trade has hitherto been almost entirely in the hands of private growers, except two local companies which have paid their shareholders from 12 to 20 per cent. dividends, and is well known to be of a most profitable character.

The Directors with confidence recommend the operations of this Company, for which there is a fine opening, as an unusually safe and remunerative investment—safe, because nearly the whole of the Company's capital is being invested in first class land in Guernsey, and Glasshouses for the Cultivats of Grapes, Melons, Tomatos, Beans, and other Choice Fruits, which are supplied from the Channel Islands into England.

The property of the Company will increase in value with the growth of the Vines.

As showing the Profits derived from dealing in Fruit and Garden Produce of the Channel Islands, the Directors are informed one of the two Companies in Guernsey has paid its Shareholders dividends at the following rates:—

1880, 10 per cent.	} Extensive building operations took place during these years.
1881, 11 "	
1882, 12 "	
1883, 15 "	

The only other Vinery Company which commenced operations recently has paid its Shareholders 12 per cent.

Applications for Shares, stating number required, can be made to the Secretary of the *Guernsey and Jersey Fruit and Produce Company*, 4, Tokenhouse Buildings, Bank of England, London, E.C.; or to the Company's Bankers. Prospectuses and any information desired will be supplied on application.

Upon a fair estimate, the Directors anticipate a dividend of at least 10 to 12 per cent. on the year's sales.

The Sales of Tomatos from one house only, for the week ending August 7, amounted to a quarter of a ton. The Directors have erected on the Company's Estate, to secure the coming winter crops, which prove very remunerative, the following:—

One 200 feet House.	Six 200 feet Hou. e.	One 180 feet House.
Two ditto.	Seven ditto.	Two ditto.
Three ditto.	Eight ditto.	Three ditto.
Four ditto.	Nine ditto.	Four ditto.
Five ditto.	Ten ditto.	Large Vinery, 45 feet wide.

Total, fourteen long Span Glasshouses and large Vinery, making a total of about 50,000 square feet of Glass.

The *Horticultural Times*, June 20, refers to the Company as follow:—

"The development of Market Gardening in the Channel Islands has often been dealt with by us, and we are glad to learn that efforts are being made to still further prove what, under high culture, the land will produce. The Guernsey and Jersey Fruit and Produce Company is a striking example of this. Incorporated only last February—when its estate did not contain a single glasshouse—it has now 50,000 square feet of glass erected! Having as local manager one of the most successful growers in Guernsey, with economical management, half the capital only called up, and nearly the whole of the capital invested in (excellent) land and houses, and of progressing value, this venture will, we predict, succeed. It has started in the right spot, under the right management, and is raising the right sort of produce. As we write, we have specimens of the Company's first Tomato consignment before us—grown without heat—and we can vouch for their excellent quality. Colour and size are almost perfect."

THE DARLINGTON GOLD MEDAL DRESS FABRICS

Are now supplied direct from the Manufactory, at Wholesale Price, there being no Intermediate Profits whatever.

HENRY PEASE & CO.'S SUCC'RS,

SPINNERS and MANUFACTURERS,
and Sole Makers of the Celebrated

**GOLD MEDAL
DARLINGTON DRESS FABRICS,**

Ladies are at liberty to change any goods for others preferred within seven days, and should not fail to see our large box of Autumn and Winter patterns, post free.

As worn by H.R.H. the Princess of Wales, and which are supplied to the public from their own mills at an immense saving, invite Ladies in any part of the world to send DIRECT TO THEM for Patterns, post-free, of their new makes for the Autumn and Winter Seasons, which embraces every variety of material a lady can possibly desire, and of which the *Daily News* says:—

"The union of warmth to lightness, so necessary to health in these materials brought to perfection."
 "The fineness of the wool of which they are composed—English Wool, he it understood—imparts the admirable quality of draping in those soft folds now so essential from the point of view of fashion."

These fabrics were awarded, at the all-England competition, the ONLY GOLD MEDAL, at the BRADFORD TECHNICAL EXHIBITION opened by the Prince of Wales. Also, the Highest Prizes at the Exhibitions of 1851, 1862, &c., and wherever exhibited.

SPECIAL ATTENTION is directed to our celebrated CROSS-WARP SERGES, which, alike, resist the effects of weather and sea, 10½d. to 3s. per yard; for Men's and Boy's wear (including the "Clerical" Serge), these will be found "clear away" the best value procurable, 2s. to 8s. 6d. per yard (58-in. wide). Our GOLD MEDAL CASHMERE, in all the New Colourings, from 1s. 9d. to 3s. 11d. per yard. NEW and FASHIONABLE COSTUME CLOTHS in great variety, from 6½d. to 5s. per yard, including "THE LOWSTOCK," "THE ASHEURST," "THE DAMIETTA," "THE KHAIBER," "THE SHUMLA," "THE TARAPACA," "THE PANAMA," "THE HOLSTEIN," "THE ZEELAND," &c.

CHARMING NOVELTIES in SKIRTINGS, including "THE YESSO," "THE NINGPO," "THE FOO-CHOO," &c.

THE DARLINGTON BLANKETS (sent on approval) are warranted Pure Wool. Money returned if not approved. In all sizes; and four different qualities.

THE DARLINGTON MEN'S UNDERCLOTHING (Pants and Vests), all Pure Wool, are made on our own premises. Sent on approval.

Address—**HENRY PEASE & CO.'S SUCCESSORS,**

THE

Gardeners' Chronicle.

SATURDAY, SEPTEMBER 4, 1886.

MOOR PARK.

THIS Park, close to Rickmansworth, Herts, derives its fame from several owners who were either great historic figures or wealthy men who lavished money on its adornment. The park of 600 acres, which is now most beautifully set with timber trees of great size, was enclosed by royal licence in the fifteenth century, by one of the most magnificent and ambitious members of the great family of Nevile, George Nevile, Archbishop of York, and brother of Earl Warwick, the King-maker. A wonderful garden, with terraces and fountains, clipped trees, and smooth bowling-greens, but few flowers, still a wonderful garden for England in the Middle Ages, and well described in Lord Lytton's *Last of the Barons*, was here formed by that accomplished prelate. The next great owner was another towering churchman, Cardinal Wolsey, who lived here in state, leaving a name which is still attached to an old and hollow Oak beneath which he is said to have reclined himself.

The Moor, or More as it was sometimes called, was then forfeited to the Crown, and afterwards leased to the Countess of Bedford, who created a second edition of famous gardens, which Sir William Temple, owner of the other Moor Park, near Farnham, extolled as the best of that time, describing the Moor as "the sweetest place that I have ever seen in my life." The Duke of Monmouth, the eldest of the numerous sons of Charles II., that father of a great many of his people, as one of the wits said, was the next distinguished owner. He was the first M.F.H., collecting a pack of hounds which were trained to hunt the fox—a novel sport two hundred years ago. After his execution his duchess is absurdly said to have decapitated the Oaks in the park to spite the Royal Navy. Unhappily, after an early marriage, when the Duke was twelve years old, they had been separated for years, and some other cause than the one assigned must be sought for the pollarding of some of the Oaks near the house, which are now, like the pollarded Burnham Beeches, the most sturdy and picturesque in the whole collection of noble specimens which form the boast of Moor Park.

Mr. Styles, a wealthy speculator, bought the place of the Duchess, to whom the estate had been restored after the forfeiture consequent on the high treason of her husband, and expended £150,000 on the house and gardens. This was the third edition of the later, and the latest of the former. A fourth edition of the gardens and grounds, at a cost of £80,000, was due to Lord Anson, the great sailor, who destroyed, so far as he could, all traces of Mr. Styles around the house, and built a temple, yet standing, which he dedicated to the winds. The accomplished Horace Walpole came down here and complained, like the caustic scold he was, of the scooping out of the ground on the north front by "Capability" Brown, who removed the

LITTLE & BALLANTYNE, THE QUEEN'S SEEDSMEN, CARLISLE.

obstructing earth which hid the distant view. I was not aware of the "scooping" at the time of my visit, but I admired, as all must do, the unimpeded view adown what seemed a natural valley, great Oaks flanking the hollow, and then afar a delightful rural landscape, the valley of the river Colne and the tower of Watford Church in the distance.

Of the Grosvenors who followed the before-named and other owners, and now hold possession—"Lord may they reign!"—the second earl of Grosvenor, who was created Marquis of Westminster in 1831, purchased Moor Park in 1828, and very greatly improved it for its present owner, the venerable Lord Ebury, his third son, who was long known to the country as Lord Richard Grosvenor. So much for the peers! Now for the plants, small and large. One of the largest trees of its kind in England, if not quite the largest, is the famous Spruce in the old pleasure garden. The trunk divides near the base into three great holes, bearing an immense mass of foliage, and reaching a height of at least 100 feet, while the size of the tree, or rather the group of parent and offspring, is increased by the growth of a numerous progeny, which have sprung, Banyan-like, from the ends of the drooping branches at a distance of 20 feet from the main trunk. Some Conifers not unfrequently exhibit this kind of reproductive energy, but one would hardly expect to find a family of Spruces rising in this way around the parent stock, on dry, high ground, freely exposed to sun and air. This particular tree may have been planted by Mr. Styles, or even by the Duchess of Mounmouth, and many of the Cedars of Lebanon, Yews, and deciduous trees in this same shrubbery are probably of the same date; but its choicest ornaments are of later date, and were planted by the Marquis of Westminster and Lord Ebury. Many of the exotic Conifers derived from both hemispheres during the last half-century or more are represented in the form of large specimens; and as Rhododendrons and Kalmias grow here like weeds, the beauty of the spot, with its pond and peacocks, smooth open lawns, and Lord Anson's temple in the midst, can be imagined. There are little gates and side entrances into the old pleasure-grounds, but no doubt when the Queen and Prince Albert visited Moor Park in 1846, the Queen Dowager joining them from Cassiobury, where she resided from 1846 to 1848, the royal party entered by the broad flight of steps. From the top of this grand approach you look down upon the four-storeyed house at a little distance, and around upon a beautiful and undulating park, which can hardly be matched for the size and beauty of its timber. We may suppose that the royal party would then be escorted by a long and winding path to the highest ground of the shrubbery, and that royalty, a little fatigued by the exertion, would admire from among the trees the wondrous fair landscape that lies around—Watford, a warm patch of red among the trees; the spires of St. Alban's, and Harrow-on-the-Hill, whose ambitious steeple is seen from almost everywhere.

There are 20 acres of this hill and arboretum, which probably rose bare-backed or only plainly planted in Wolsey's time, and the shades of green in May, when each deciduous tree wore a new robe, and each evergreen a renovated cloak, were delicious. There are Cedars and Araucarias—how different their hues! Here are bright green Thuas, pale green Chestnuts, and paler Oaks. To catch all the tints from sombre Vew to light deciduous Cypress, an artist must mix his colours shrewdly. But the most gorgeous colours in the grounds were on the necks and tails of several male peacocks, strutting about among their hens. They seem very obliging birds when they are asked to do what it is known they delight in. If you say at the proper moment, when the hens are attentive and rivals not far off, "Display your tail, beautiful bird," it is done at once; and then if you approach too close, and command the creature to desist, he will shut up his extended fan and recommence the exhibition further off! The hens sit well here among the shrubs, and a common family consists of five young ones.

An Italian garden, not too formal to be nicely planted with shrubs, divides the north front of the house into the park, and passes, without interposing fence, into a less formal stretch of planted lawn enveloping the west front, and sloping away to a delightful fernery, a most pleasant retreat at the

farther corner of the garden. The Cedars of Lebanon here are of first-rate size, and many notable evergreens, trees and shrubs, with one among them which is not so often met with as it deserves, the Hemlock Spruce—a common tree, but one of uncommon beauty when grown to a large size, as is another common tree, the English Elm, a noble specimen of which stands on the lawn, where it sheds its small leaves in the season and makes a great litter, but is worth all the labour it occasions, being so thoroughly English and so stately. The largest of two great Portugal Laurels on the terrace is 31 feet in diameter.

THE FRUIT GARDEN.

It is time to pay a brief visit to the kitchen gardens, which are remarkable, and bespeak in their appearance the watchful skill of Mr. Mundell, the presiding genius of the varied horticulture of Moor Park. In these days one becomes somewhat hardened to the achievements of gardeners under glass. I saw five vineries and four Peach-houses and others in excellent condition, and I must confess to have found nothing more interesting in the various houses and pits than the choice collection of hardy Ferns in one of them, notwithstanding the Orchids and other rarities. Even among the exotic Ferns there are few more beautiful than a large specimen of *Polystichum plumosum*, an exquisite plant, with most delicate foliage. Mr. Mundell has the Axminster variety of this hardy Fern. Even flowers may not always detain an admirer who may happen to be on the wing, but few would resist lingering in one of the houses here which is entirely devoted to blossoming plants, and presents always the gayest possible appearance. An experienced and accomplished duchess bearing a great historic name, and passing through this house during my call, complimented Mr. Mundell on his "beautiful flowers," and as a gardener who pleases the ladies, and especially the duchesses, achieves success, I will give the names of a few of the most useful plants in this house. Hanging from the roof above is *Clematis indivisa lobata*, which had produced a continuous supply of pure white flowers since February, a period of ten weeks, at a time when flowers, especially white ones, are most valuable. Another most useful plant for those who are called on to supply loads of flowers for decoration is a Fielder's White Azalea, a fine specimen of which stands here 8 feet high and 6 feet through, and was still covered with pure white blossoms, after having yielded baskets and baskets full of cut flowers during many weeks past. This second crop of flowering plants, the Azaleas generally and the Camellias having been removed, includes *Calceolarias*, *Dautia gracilis*, *Rhodantea*, *Sikkim Rhododendrons*, *Genista*, *Eupatorium*, the Ball of Fire *Populeum*, *Salvia*, and many others, and among them the common white *Arum* of cottage windows lifts its pure white blossom, too beautiful to be abashed even amid the highest aristocracy of Flora's court. The next floral display, when the present one has passed, will consist of *Pelargoniums*, tuberous-rooted *Begonias*, zonal *Pelargoniums*, *Schizanthus*, *Fuchsias*, and others. *Chrysanthemums*, which are first-rate here, and of many choice sorts, including 150 varieties, will follow.

Mr. Mundell's house in the gardens, looking due south, is thickly covered with white and yellow Banksian Roses. To a neighbouring wall *Weigela Boyssmanni aurea* makes a conspicuous display. The soil consists of a warm gravel-loam resting on chalk 20 feet deep, and the whole of the kitchen garden slopes to the south. Aspect and soil are both suited to the ripening of fruits and the health of tender plants. The extent of the garden is 8 acres, lofty walls enclosing 5 acres, while the space devoted to wall fruit is increased by a lower division wall across the centre. On one of the high walls are a number of fan and standard-trained Apricots, the offspring of the original Moor Park Apricot which Lord Anson introduced and which died in 1846. These were well set with fruit after producing many bushels last year. The trees which produced the 517 varieties of Apples which were sent to the Apple Congress border the central walk of the garden and occupy very little room, being admirably trained on the Paradise stock in the form of bushes, hollow as a goblet in the centre, and none of them exceeding 5 feet in height. All the fruit trees are admirably trained. Some of the walks are lined with pyramidal Pear and Plum trees, and the upper walk, running parallel with the Apricot wall, and with a lean-to Peach-house built against the same wall, is margined

with umbrella-trained Pear trees. This system of training is especially adapted to trees with slender branches and a weeping habit, such as *Josephine de Malines*, *Winter Nellis*, and the old *Seckle Pears*, which all weep freely.

In passing through the lean-to Peach-house I admired the robust growth of the *Roses*, *Gloire de Dijon*, and others, trained up the pillars with stems as thick as a man's wrist. A quantity of *Fuchsias* at the back in pots were removed into the house of perpetual blossoms in July. *Strawberries* are well grown here, in proof whereof a pound weight per diem had been gathered since March 1—eleven weeks. The price of this fruit in London had been 12s. and 14s. per pound.

Twelve gardeners are employed here, and the young men are made comfortable in a capital well managed bothy, where the horticultural papers are taken in. I must not conclude without mentioning the Moor Park Horticultural Society, which is highly successful in promoting good gardening in the neighbourhood. *H. E.*

New Garden Plants.

PHAIUS HUMBLOTII, *Rehb. f.*

If you can forgive this plant for being a *Phaius* whose flowers are not as lasting as those of certain *Vandas*, *Miltouas*, or *Cattleyas*, then you must admit its beauty. It would appear to be very scarce. I had last year a flower from Mr. Peeters, St. Gilles, Brussels, and now I have a raceme at hand, kindly sent me by Sir Trevor Lawrence, Bart., M.P., P.R.H.S. Both the sepals and petals are rather broad, nearly as in *Varrea tricolor*, and *Aganisia cyanea*, and the lip shows large lateral side lacinia and a broad, nearly reniform, wavy mid lacinia. The sepals and petals are of a fine purple. The petals outside have a longitudinal white stripe, divided by a narrow purple line. Side lacinia of the lip with brown stripes and bars on a white ground outside, brown inside, mid-lacinia light purple. A white line runs over the middle underneath. The callus is clavate, sulcate at the base, running with its narrow end on to the disc of the central lacinia, hairy at the base, fine yellow. Column whitish, with green top. Sir Trevor declares it "second only to *Phaius tuberculatus*?" The leaves and bulbs are in habit and general appearance like those of the old *P. grandifolius*, but the former are not so large or nearly of such firm texture, and are paler in colour. The bulbs are much smaller, and throw roots from their upper surface. The flower-spoke springs from the underside of the mature bulb, a little in front, but not in connection with the young shoot. The delicate leaf-texture makes the leaves a toothsome morsel for thrips, &c. All those remarks are Sir Trevor's. *H. G. Rehb. f.*

CYPRIPEDIUM CONCOLOR (*Parish*) CHLOROPHYLLUM.

Mr. R. Eichel (gardener to J. Charlesworth, Esq.) kindly sends a leaf and flower of a *Cypripedium* imported by Mr. F. Sander, and collected by his excellent traveller Mr. Foerstermann (whose remarks about *Vanda hastifera* I quoted when I spoke of *Vanda Lindenii*, p. 70). The flower is full of small spots, and the leaf is free from any marbling. Mr. Foerstermann, who was present when the box arrived, told me he found specimens with green leaves, others with little marbling, but the majority with well marbled leaves. *H. J. Rehb. f.*

CYRTOPERA REGNIERI, *n. sp.**

A stately rival of *Cyrtopera flava*, Lindl., bearing a raceme of fine, large, chrome-yellow flowers. The peduncle stands at the side of the shoot of young oblong-lanceolate leaves. Both sepals and petals are lanceolate acute, all falcate. The lip is of unusual shape, being oblong-lanceolate, with a wide blunt angle at each side in the middle. It forms, with the lateral sepal, a conical, retrorse, compressed chin,

* *Cyrtopera Regnierii*, *n. sp.*—*Alt.* *Cyrtopera flava*, Lindl.: pseudobulb. 8 trigonum oblongo rotundis articulatis; foliis lanceolato-oblongis acutis; pedunculo alato-racemoso; sepalis petalisque falcatis, l. alio oblongo a toto utrinque medio semiovato auriculato, mento conico compresso retrorso. Flores pulchre flavi. Cochinchina. Regnier legit vivamque misit. *H. G. Rehb. f.*

thus being widely distinct from the rather well-known *Cyrtopera flava*, Lindl., which I once received fresh from the Royal Exotic Nursery of Messrs. J. Veitch & Sons. Column trigonous. Anther transverse, with two blunt, very short horns. Flowers not quite so large as those of the just named *Cyrtopera flava*. It was discovered in Cochinchina, by Mons. Regnier, horticulturist, who has now got it flowering at his establishment at Fontenay-sur-Bois, and whose name it justly bears. Mons. Regnier has also in flower the red-lipped *Yanda Roxburghii*, R. Br., from Cochinchina. *H. G. Rehb. f.*

THE COLONIAL EXHIBITION.

No. IX.

INDIA (continued).—Next to the native shops referred to in our last notice the seed and grain trophy is perhaps the most popular; standing, as it does, in the centre of the court, it cannot fail to be seen, if not actually admired by all. The seeds used in the decoration of the trophy are very varied, and they are here arranged more for effect than actual use, patterns being worked out according to colour. As this aspect of the trophy, however, is not within our province to criticise we will briefly notice some of the seeds used in carrying out the design, and this may be the more interesting, as the seeds are not named, and, indeed, from the nature of the design, it would be impossible to do so. The following are amongst the seeds used:—The Physic Nut (*Jatropha curcas*), the oil of which is a powerful purgative. The plant is a bush or shrub, native of tropical America, but introduced and now grown in most tropical countries. These seeds are about three-quarters of an inch long, and of a dirty black colour. Here are also the seeds of the Gingelly, Benne, or Teel (*Sesamum indicum*), the oil of which is very extensively used in India for culinary and a variety of other purposes. The oil is brought to this country in very large quantities, and used as a lamp oil, in soap making, and for mixing with Olive oil. Cold drawn Sesamum oil is used in France and Italy for salads, and the lamp-black used in China and Japan for making the best Chinese ink is produced by burning Sesamum oil. The seeds are small, somewhat flattened, and Pear-shaped, and vary considerably in colour, from a dingy white through various shades of brown to black. The combined violet and green tints of the Pistachio-nut (*Pistacia vera*) causes it to be distinct in appearance from its neighbours. In consequence of its pleasant taste the Pistachio-nut is eaten in large quantities, not only in India but on the shores of the Mediterranean. Sometimes they are cooked and eaten with salt and pepper. The oil has a very agreeable smell, and is occasionally used in perfumery, or for scenting soaps. Pistachio-nuts can be obtained in this country, but are not so well known as they deserve to be.

Another well-known oil-seed, which is in itself edible, is the Ground-nut or Monkey-nut, as it is sometimes called (*Arachis hypogea*), an annual herb, probably of American origin, but now grown very largely in all warm climates, both as a food and for the sake of the oil contained in the seed, but more especially for the latter purpose. The oil is of a sweet lipid character, and is much used as a substitute for or mixing with Olive-oil, and also for making pomades, soaps, burning in lamps, and for various other uses. The Ground-nut is well known for its habit of pushing its young fruit under the surface of the soil and there ripening, from which habit its common name is derived.

In the genus *Bassia* the best known species are *B. latifolia* and *B. longifolia*; both of these have shiny brown seeds, with a broad rough scar on one side running the entire length of the seed, which averages from 1 to 1½ inch. The former species is a large deciduous tree, common in the forests of Central India, and cultivated and self-sown throughout India generally. Gamble describes the oil obtained from this species as having a greenish-yellow colour, and says it "is eaten by the Gouds and other Central Indian tribes, and is now used to adulterate glue, and in soap-making. It solidifies at a low temperature, but melts at a temperature of 110°, and though it keeps well in a cold climate, in a hot one it soon becomes rancid, and separates into two parts—a clear fluid oil above, and a thick brown substance below. One seed of oil is obtained from four seeds of kernels." The tree is generally known as the Mahwa, and is

celebrated for the fleshy flowers or corollas, which are eaten as food, or distilled for the spirit which is obtained from them.

Bassia longifolia is a large evergreen tree growing in South India and Ceylon, and known in each country respectively as Iluppi and Mee. From the seeds an oil is expressed which is used for similar purposes to the last named, as are also the flowers. Amongst other oil seeds shown in the trophy are the Castor (*Ricinus communis*), the varieties of which are very numerous, some of the seeds being of a reddish or chocolate-brown colour, while others are nearly black. They also vary much in size, from a quarter to half an inch or even five-eighths inch long. The castor oil of commerce is obtained either by simple expression or by expression with a certain amount of heat; that obtained by the first process, known as cold-drawn castor oil, is the best. The Castor-oil plant is originally a native of India, but is now widely dispersed through tropical and warm countries, in the former of which it grows to a height of about 40 feet, becoming much smaller in warm climates, while in colder climes it is known as an annual.

Sunflower (*Helianthus annuus*), and Linseed (*Linum usitatissimum*), both of the brown and white varieties, are here shown; besides many varieties of food seeds and grains, such as Lentils (*Lens esculenta*), Dolichos Lablab, green grain (*Phaseolus mungo*), ordinary grain (*Cicer arietinum*), Job's Tears (*Coix lachryma*), Maize (*Zea Mays*), &c.

Of the very extensive collection of fibres, which has attracted a considerable amount of attention amongst specialists, it would be difficult to speak without a very extended notice; it will, therefore, suffice to draw attention to the Gleerock Company's exhibits of China-grass (*Bomberia nivea*), and fabrics made of the fibre, showing what can be done with this useful Nettle. The leaves of Puya fibre, from Maoutia Puya, will also attract attention, indicating as it does what might prove to be an excellent paper material, if not a textile. In India it is used for making cloths and fishing-nets. Close to this are fine samples of Ehabgrass (*Pollinia eriopoda*), a very strong grass, much used for ropes and cordage. Dr. Watt says it is "largely used in the tract between the Jumna and the Sarda, and is particularly abundant in the Garwhal Himalayas."

Amongst products interesting to the pharmacist, some fine samples of Cinchona bark will attract attention, especially one of Cinchona Ledgeriana, from a seven years' old plant, and some stems with moss-renewed bark. *John R. Jackson, Curator, Museum, Royal Gardens, Kew.*

MARKET GARDENING AT ST. NEOTS.

If any one desire to study market gardening on an extensive scale, and at the same time see it well done, he cannot do better than start at Hitchin, and working his way into Bedfordshire, through Biggleswade and Sandy, and then into the borders of Huntingdonshire at St. Neots, he will come upon abundant illustrations of an exceedingly interesting and instructive character; and not only is market gardening well done, but also under varying aspects. When at St. Neots recently I had an opportunity of looking through the extensive market gardens of Mr. Isaac Hall, of Eynesbury, close to St. Neots, who tills about 150 acres, the whole of it devoted to vegetable and none to fruit culture. At Eaton Ford, close by, his brother, Mr. John Hall, cultivates 250 acres, and as in both cases the work is well done, they are large employers of labour in the district. A great deal of the produce goes to London, but the majority goes to the North, finding outlets in the great industrial centres where the consumption of vegetables is very large. The vegetables are packed in good sized packets and forwarded by rail, both North and South; and the business done at St. Neots and other stations must be something enormous. Vast quantities of manure are brought from London by rail; the soil is well enriched, and large crops of fine vegetables is the result.

Potatoes are largely grown: great quantities of Myatt's Ashleaf for early crops, also International Kidney, Beaufort of Hebron, Schoolmaster, and Magnum Bonum. The soil is well adapted for Potato culture, and, indeed, for all vegetables; it is of a somewhat adhesive sandy loam, 2 feet or so in depth, with gravel beneath. Rain passes quickly from the

surface. I can quite understand that in a season of great drought the crops would suffer a good deal; on the other hand, a good rain twice a week at this season of the year, with intervals of hot sunshine, must be of great advantage. Nothing could look better than the Potato crops—not a trace of disease was to be seen, and the produce was good all round.

Before the Myatts are dug, Brussels Sprouts are planted between the rows, and where the earliest crops had been dug the plants of Brussels Sprouts were almost touching each other, so great a progress had they made.

Beds of Bedfordshire Champion, or Wood's Ridge Cucumbers, are a great sight. The seeds of Cucumbers are sown in the open ground in the month of May in beds about 9 feet in width, and between each pair of beds is a line of Rye some 2 feet in width; this affords an excellent protection, and the Rye is sown early so as to get up and form shelter by the time the Cucumber seeds are putting forth their first leaves. Vegetable Marrows are similarly grown; but the beds of Marrows are 13 feet in width; the seeds are put in May in the same manner as Cucumbers, with lines of Rye between the beds, running from east to west. Two types of Marrow are grown—one the ordinary long white, with its vigorous trailing stems, the other is known as the Bush Marrow. This is a singular type, making an erect bush-like growth, and throwing up several very strong leaves, and forming clusters of fruit in the very heart of the plants. These plants can be grown a yard or so apart, and they are found to vary in the character of the foliage. Some have almost entire leaves; others have them deeply cut; in some cases the fruit are white, in others, green, in others mottled. Any spaces between the plants caused by failure of seeds to germinate, &c., are filled up by planting Veitch's Autumn Giant Cauliflower.

Red Cabbage, for pickling purposes, must be in large demand, for here was a huge piece of the Red Drumhead variety, the Cabbages of great size already, measuring fully 1 yard across the leaves. The Intermediate Onion, a half globular-shaped variety that looks like a selecting from the White Spanish. The seed is sown broadcast in spring with Parsley—very thinly, and when the Onions are pulled, then there is a plantation of Parsley that comes in very useful for consumption during autumn and winter, when it is in demand. I should think there were from 9 to 12 acres of Intermediate Onions.

Scarlet Runner Beans are a leading feature, and could be seen in large breadths, 4 acres or so in extent, the leading shoots are pinched out, which causes the plants to branch freely. The seeds are sown at the usual time between rows of Myatt's Kidney Potato, and they afford protection to the young plants as they come through the soil. In any cases where the Beans fail to grow plants of Veitch's Autumn Giant Cauliflower are put in. Beds of Potatos 10 feet or so in width are placed at intervals between the Beans, and by leaving out two rows of Beans here and there space is afforded to get carts down between to load. I may state that at the time of my visit the Rye grown between the lines of Marrows and Cucumbers was being cut and dried ready for threshing; the straw being soft and yielding, is sold to manufacturers for stuffing horse-collars.

Here were really wonderful beds of Parsnips of great size, and of a quality apparently impossible of being surpassed. The Covent Garden, a Pine-apple Beet, highly selected, is also largely grown, and making striking patches of colour among the green-leaved crops. Huge beds of James' Green-top, or Intermediate Carrot, were being pulled; the seeds are sown fairly thick, and during the last weeks in July and the early part of August the Carrots fit for market are pulled out, and the small ones left, which speedily grow in size, and furnish later crops. Jerusalem Artichokes are largely grown; the crop is treated exactly as they do Potatos, but planting is done earlier—generally in February.

Enormous beds of pickling Onions are grown, and the seed is sown in February and March at the rate of from 20 lb. to 30 lb. to the acre. The Bedfordshire pickling Onion appears to be a selection from the White Spanish that bulbs early, and the picklers are pulled and marketed at the end of July and onwards. White Spanish or Reading Onions are grown to a very large extent. I saw one piece of nearly 6 acres, and so good did they seem that the newer varieties, so called, must be good to

be improvements upon the strain of selected Reading Onion grown about here. The Sandy and Biggleswade districts especially are famous for their Onion growing, and large quantities of seed of White Spanish Onion are harvested in the county of Beds, and sold to the London wholesale trade.

The foregoing is a rapid sketch of a representative Bedfordshire market garden. The wonderful order in which the ground is kept was a noticeable feature; but few weeds were seen unless in the midst of crops, where they could not be hoed up without injury. Constant and rapid cropping is the order of the day, and this in association with high culture. From such a market garden goes out annually vegetable food for thousands of mouths in the great industrial centres. R. D.

ROSE SHOWS.

Rose showing, since the formation of the National Rose Society, in 1876, now ten years ago, has become so general, has penetrated to all parts of the kingdom, and has so increased the interest that is felt in the growth of the flower, that anything connected with these exhibitions must be of interest to a wide *clérentle*. The societies affiliated with the National Rose Society adopt the rules of the National, and although in the drawing up of their schedules they may differ from the parent society, yet in the main the idea which pervades them, viz., giving an opportunity to all growers to have a fair chance of competing—is generally acknowledged and acted upon.

During the ten years of its existence the Society has year after year elaborated its schedule—a numerous and painstaking committee have diligently and earnestly revised it, until now it requires very little more than to say ditto to its last year's schedule, and therefore, if I take exception to one or two of its prizes it is not because they were wrongly conceived, or are in themselves objectionable, but because experience has, I conceive, shown that they would be better expunged from future schedules. Already the Society has acted on the principle, that where after some years' trial a class does not seem to be sufficiently popular, it should be done away with, as in the case of suburban Roses, as they seemed more likely to encourage the growth of Roses in the neighbourhood of London, than to offer special prizes for flowers grown within 8 miles of Charing Cross. This was done, and in the first year or so fairly creditable flowers were exhibited; but after that the exhibitors were so few in number that it was determined to do away with it, while a cup offered for some suburban Teas has never yet been won. In advocating the abolition of certain prizes now offered, I should not be deviating from the principle already acted upon by the Society, and for the same reason should like to see two of the classes in the present schedule expunged.

There is first of all, the prize for a basket of Tea and Noisette Roses. This prize, it is true, was kindly offered by Messrs. Paul & Son, and in order that all might start on terms of equality, a very pretty basket was supplied by them to intending exhibitors, with moss to arrange the flowers in. I believe that to the givers of the prize, and to the general public, the result has been disappointing—the competition has been very limited indeed—this year there were fewer exhibitors for it than at provincial shows where the same attempt has been made, and I hope I shall not be accused of a want of gallantry if I say they were all more or less disappointing. I do not call a basket of Roses gracefully arranged when the flowers are wired, and I feel that it hardly falls within the designation; nor do I think swaddling the legs of the basket in moss and then sticking Roses into them, which must fade in a few hours, enhances their beauty; but in truth all arrangements of Roses only, wherever I have seen them, are more or less disappointing; no double flower leads itself well for the purpose—hence it is that the single Dahlia became so popular for this purpose.

Who that compares the effect of the most beautiful of Truffaut's Asters with the single Marguerite, or the most splendidly built-up double Dahlia, however brilliant its hue, with *Paragon* or *Cervantes*, but will acknowledge this; and let a bouquet of single flowers be placed alongside the most carefully arranged bouquet of Roses, and in nine cases out of ten the palm for beauty will be given to the single flowers. I do not mention the single Rose, because unhappily I have always found

them too shortlived. The prettiest stand of Roses I ever saw arranged was some years ago at Reigate, composed solely of the wild Brier, but before the day was half over the flowers had all faded. There are, I believe—so my friend Mr. Girdlestone tells me some which stand better, but they are not generally known. Perhaps the donor of this prize would not object to transferring it to something else which would be more likely to benefit the Rose.

Another prize that I think might with safety be abolished is that for six new Roses for amateurs. The object of offering these prizes is, I opine, that we may have an opportunity of seeing what novelties are likely to take their place in the cherished list for exhibition; in the case of nurserymen we do have that opportunity, but I cannot say that in the amateur class it is very edifying. You get either Roses that are on half the stands of the show, or else such poor specimens of new ones that they teach us nothing—indeed, I believe there is a general feeling of disappointment amongst amateurs that the nurserymen's stands in the class are not more effective than they are. The exhibition of the National this year quite bears me out: there were but two stands placed in competition; the first contained five out of the six which were thoroughly well known to all growers of Roses, and the other stand was not considered deserving of a 2d prize, and had only a 3d awarded to it.

Before discussing the subject of prizes at the National's exhibition, I may refer to a controversy which has been going on in the *Journal of Horticulture* with regard to the grievances of small exhibitors. A great deal of what is vulgarly called "bosh" has been written on the subject, and a suggestion made that divisions should be created for those who do not employ a gardener regularly—a suggestion which I hope most devoutly the committee will never entertain. I know from experience what heartburnings these classes create in some prominent societies which have adopted them; and nothing, I believe, could be more detrimental to the Society's interests than importing such a class into its schedule.

There are one or two prizes given at prominent shows which the National does not recognise, and which I believe would be better left out, because of the difficulty of deciding on them; one of these is that for the best box of Roses in the show; one such prize at Moreton-in-the-Marsh was given this year of the value of £10—a most demoralising amount, and which was ultimately divided between two stands. I say the difficulty of deciding; upon what principle is it to be done? Would a box of six in any case have a chance against a box of seventy-two which was up to the mark? In this case it fell between two boxes, one of seventy-two, and the other of twenty-four. The judges went for it by points. They awarded the number of points, allowing three as the highest to each bloom, and then divided them by the number of blooms. In this they were as nearly as possible equal. Then in the box of seventy-two there were three blooms inferior to any three in the twenty-four, while there were four or five in the seventy-two superior to anything in the twenty-four; and after a long discussion and examination the course I have mentioned was adopted; it was not done for the purpose of making things pleasant for both parties, because I am sure it would not have had that effect—each competitor would consider himself aggrieved, and think that he ought to have had the full prize—but simply from the impossibility of determining. Of course the system of judging may have been considered faulty, but I believe that those who like the plan would be very thankful to be informed of a better one. However that may be, provincial societies may take it into their consideration, whether they might not bestow the amounts thus given in some better way, especially as the National does not recognise it.

There is another prize which is often given, which is, I think, of a very questionable character—that for the best Rose in the show, or in the amateur classes. That is not the plan adopted by the National. There the medals are given for the best hybrid perpetual, and also for the best Tea or Noisette, and to them no objection can be made; but it is different where the two kinds of Roses are present together, and one had to decide between, let us say, a grand bloom of *Marie Baumann* and an equally fine bloom of *Souvenir d'Elise*; is it not perfectly clear that there can be no comparison between the two? Suppose that a medal were to be offered at an agricultural show for the best animal in the exhibition—horse, cow, sheep,

or pig, would not the absurdity at once strike one? And yet I believe it would not be a bit more incongruous to put a horse in competition with a bullock than to put a Tea Rose to compete with a hybrid perpetual. The individual taste of a horsey judge would doubtless lead him to prefer his favourite animal to any bullock, however systematically "finished"; and so the lover of a Tea Rose would, probably, place the hybrid perpetual in the background, and give it to his favourite, although the one might be as absolutely faultless as the other. Hence societies would be wise, I think, to offer their medals for one or the other, or both, but not to confuse them together.

I have, as I think may be inferred, made these observations in no captious spirit, but with a sincere desire to benefit Rose showing; and I think it says something for the care with which the schedules both of the National and of its affiliated societies are drawn up, that these are the only classes to which I think exception can be made. There is one other subject in connection with it that I would advert to, and that is whether, considering the vastly increased growth and great popularity of the Tea Rose, more liberality might not be shown in the classes devoted to it. Rose growers are beginning to fad out that it is not nearly so tender as it was supposed to be, that being partly due to the general substitution of dwarfs on the seedling Brier, and to the greater vigour of the newer varieties. Everywhere that I have gone this year I hear of gardeners grubbing many of their hybrid perpetuals, and substituting Tea Roses; and when one considers their extreme beauty and lasting powers, I do not wonder at it. Our gardens now are not, I will say, a blaze of bloom with them, but full of other sweet and delicate blossoms, while the hybrid perpetuals, only here and there show a gorgeous bloom which the hot sun soon disfigures. I am not sure, too, whether larger classes might not be made for them; and if the National set the example I have little doubt that the affiliated societies would follow suit, and thus afford to all lovers of the flower greater satisfaction at future exhibitions. *Wild Rose.*

TUBEROUS-ROOTED BEGONIAS.

In no garden, public or private, have I seen tuberous-rooted Begonias grown so extensively and well as they are this year in the beautiful gardens at Madresfield Court. I refer more particularly to the several beds which are filled with these showy and most easily managed plants in the charming flower-bed opposite the Court. The plants are furnished to the ground with healthy foliage, and covered with large flowers, ranging in colour from brilliant scarlet to pure white, and the shades of colour being arranged respectively in masses; the effect thus produced, when contrasted with the masses of pink, mauve, blue, &c., is very telling. As many people experience not a little difficulty in raising a stock of tuberous-rooted Begonias, and afterwards growing and flowering the plants satisfactorily, a few remarks respecting the method of procedure practised by Mr. W. Crump, who has made many improvements in the gardens at Madresfield within the last three years, may, therefore, be instructive to not a few readers of the *Gardeners' Chronicle* who desire to succeed in the culture of the plants in question. It is as follows:—The plants, when taken from the flower garden towards the end of September or early in October, according to circumstances, are laid in closely together in a cold pit, burying the tubers slightly under the surface of the soil, and allowing the stems to die off gradually. The only protection they receive during the winter is a sufficient thickness of Fern or dry litter to prevent frost from reaching the tubers, the sashes being removed for use elsewhere until spring, when they are replaced, and the protecting material having been previously removed, the tubers gradually start into growth, and a free circulation of air being allowed between them, at bedding-out time a sturdy lot of plants is secured. The floral display resulting from two or three lights of surplus stock plants thus treated fully demonstrates the soundness of Mr. Crump's practice, and in itself it is well worth a visit to see at the present time, as also are the plants subjected to pot culture in the greenhouses.

Where it is desirable to increase the stock it is a good plan to divide the tubers, retaining an eye or two on each division, and after they have been ex-

posed to the light for a week or ten days, to harden the wounds, to plant them in a frame placed on a gentle hotbed in spring, leaving sufficient air on to prevent the buds or eyes from starting into growth before root-action has taken place, which would be disastrous in its consequences, inasmuch as the growth so made would only continue so long as the sap stored up in the piece of tuber lasted, when it would collapse in consequence. *H. W. W.*

HISTORY OF CELERY.

If we consider cultivation as embracing only the removal of a plant to fertile soil and its protection from injury from crowding, the only marked effect of the continuance upon a plant through itself and its offspring seems to be embraced in the one word expansion, *i.e.*, increase of size. If we enlarge the meaning of cultivation so as to embrace selection and the

grown in Europe. John Bauhin, whose *History of Plants* was published in 1650, many years after it was written (he died in 1613), states the Water Melon to be so large that one could scarcely embrace it with the two hands, "quos fere ambabus manibus ambias." Margravius, whose *History of Natural Productions of Brazil* was published in 1645, describes the Water Melon as being as large as one's head, "magnitudine capitis humani." That our present types of fruit were then known is evidenced in many ways, but can be given succinctly by Caspar Bauhin's statement in his *Pinax*, edition of 1623, that some have a green skin, others a skin spotted with dingy white; the flesh of some red, of others white; the seeds black, red, and tawny in varieties. Ray describes the fruit as round, or globose, or even elliptical. In modern times we have fruit so large that my arms cannot embrace the oval, and a weight of 96 lb. has been claimed, probably with justice.

In seeking for a good illustration of the stability of

It is supposed to be the Selinon of the *Odysey*, the Selinon heleion of Hippocrates, the Eleioselinon of Theophrastus and Dioscorides, and the Helioselinon of Plioy and Palladius. It does not seem to have been cultivated (Bodæus and Scaliger's Theophrastus, ed. 1644, p. 304; Ruellius' Dioscorides, 1529; Pliny, *Grandsagne*, ed. Palladius; Gesner's *Script. rei rust.*), although by some commentators the word interpreted as Smallage has a wild and cultivated sort. Nor do I find any clear statement that this Smallage was used as food, for sativus means simply planted as distinguished from growing wild, and we may suppose that this Apium, if Smallage was meant, was planted for medicinal use. Targioni-Tozzetti (*Hort. Trans.*, 1854, 144) says this Apium was considered by the ancients rather as a funeral or ill-omened plant than as an article of food, and that by early modern writers it is mentioned only as a medicinal plant. This seems true, for in the books in my library I find that Fuchsius, 1542, does not

FIG. 59.—MOOR PARK. (SEE P. 293.)

cross-fertilisation of the flowers which yield seed for future use, the subject becomes more complicated, and we find it difficult in all cases to connect the sequence of cause and effect. One fact, however, through careful observations, seems undoubtedly true, that by selection alone, without the assistance of the break caused by a cross-fertilisation, changes in our plants are extremely slow, and many generations are required to obtain and fix any change other than increase, which is sufficient to be noted by the casual eye. In support of this view we can direct attention to the little change that has been produced by centuries of culture in those plants which represent but improved forms of a wild species, such as the Parsnip, Scorzonera, Salsify, &c., among roots; and we may also call attention to the stability of type-form during centuries of culture in the Egg Plant, Pepper, and I may even add the Pumpkin. Perhaps one of the most interesting instances of increase of size without change of type can be seen in the Water Melon. The old herbalists figure this fruit of small size, but, as is very likely, only small varieties were commonly

type joined with a change produced by cultivation and selection I have taken the Celery, as this vegetable seems to be of modern origin, and the variations from the wild plant have been apparently deemed great, although really but slight, except in expansion produced by freedom of growth and changes which have slowly accumulated through selection.

The Celery has originated from the Apium graveolens, L., a plant of marshy places, whose habitat extends from Sweden southward to Algeria, Egypt, Abyssinia, and in Asia to the Caucasus, Beloochistan, and the mountains of British India (De Candolle, *Origine des Plantes Cult.*, 71), and has been found in Fugia (Ross, *Voy. to the South Seas*, ii., 298; Apium antarcticum, *Cook's Voy.* ed. 1769, i., 28), in California (Nutt., *Journ. Acad. Phila.*, n.s., i., 183), and in New Zealand (Forster, *Pl. En.*, 67).

* Cardanus, however, in his *De Rerum Varietate*, 1556, apparently refers to a Water Melon, "Magnitudo quandoque tanta, ut homo expansis brachiis vix una amplecti queat." But then Cardanus was dealing with wonderful things. He calls it "Ascuria, qua melopeponem obit. Galenus vocat, quod non distincta sit canalis ut peponi sed rotunda ut pomum."

use alone, as did Walafridus Strabo in the ninth century; Tragus, 1552, likewise; Pincus, 1561; Pena and Lobel, 1570; also Ruellius' Dioscorides, 1529; Camerarius' *Epitome* of Matthioli, 1586, says planted also in gardens, "Serritur quoque in hortis;" and Dodonæus, in his *Pemptades*, 1616, speaks of the wild plant being transferred to gardens, but distinctly says not for food use. According to Targioni-Tozzetti (*Hort. Trans.*, 1854, 144), Alamanni in the sixteenth century speaks of it, but at the same time praises Alexander's for its sweet roots as an article of food. Bauhin's (1623) name, Apium palustre and Apium officinarum, indicates medicinal rather than food use; and J. Bauhin's name, Apium vulgare ingratus, does not promise much satisfaction in the eating. According to Bretschneider (*Botanicon Sinicum*, 78), Celery, probably Smallage, can be identified in the Chinese work of Kia Sz'mu, the fifth century, A.D., and is described as a cultivated plant in the Nung Cheng Ts'nan shu, 1640. We have a mention, however, of a cultivated variety in France

by Olivier de Serres in 1623 (Ponce, *La Cult. Maraich.*; also Heuze, *Les Plantes Alimentaires*, i., p. 5), and in England these wassold in 1726 for planting for the use of the plant in soups and broth: (Townsend, *Seelmann*, 1726, 37); and Miller (*Bot. Offic.*, 1722) says, in 1722, that Smallage is one of the herbs eaten in the spring to purify the blood. The cultivated Smallage is even now grown in France under the name of *Celeri a couper*, differing but little from the wild form. The number of names that are given to Smallage indicate antiquity, such as—Arabic, *Asahis*; Italian, *Apio*; German, *Eppich*; Spanish, *Fervel daga*; French, *Ache* (Pineux, 1561); Egypt, *Kovaf* (Pansk.); English, *Smallage*, &c.

The prevalence of a name derived from one root indicates a recent dispersion of the cultivated variety. Vilmorin (*Les Plantes Potagères*, 72) gives the following synonyms:—French, *Celeri*; English, *Celery*; German, *Sellerie*; Flanders, *Sellery*; Denmark, *Selleri*; Italy, *Selano*; Spain, *Apio*; Portugal, *Apio*; and M Inoh (*Book of the Garden*, ii., 150) gives for the Spanish, *Apio hortensis*. The first mention of the word *Celery* that I have observed is in Walsflidus Strabo's poem, entitled "Hortulus," where he gives the medicinal uses of *Apium*, and in line 335 uses the word as follows:—

"Passio tum Celery cedit deviata medice."

—the disease then to *Celery* yields, conquered by the remedy, as it may be liberally construed; yet the word *celery* here may be translated quick acting, and this suggests that our word *Celery* was derived from the medicinal uses. Strabo wrote in the ninth century, having been born A.D. 806 or 807, and dying in France in 840. Targioni-Tozzetti (*Book of the Garden*, ii., 150) says it is certain that in the sixteenth century *Celery* was already begun to be grown for the table in Tuscany. I cannot find any mention of *Celery* in Fuchsius, 1542; Tragus, 1552; Matthioli's *Commentaries*, 1558; Camerarius' *Epitome*, 1558; Pineux, 1561; Pena and L'Abel, 1570; Gerard, 1597; Clusius, *Rar. Plant.*, 1601; Dodonæus, *Pemp.*, 1619; or in Bauhin's *Pinax*, 1623. Parkinson's *Pardaisus*, 1629, mentions *Sellery* as a rarity, and names it *Apium dulce*. Ray in his *Historia Plantarum*, 1656, says the Smallage transferred to culture becomes milder and less ungrateful, whence in Italy and France the leaves and stalks are esteemed as delicacies, eaten with oil and Pepper. The Italians call this variety *Selder* or *Clery*. The French also use the vegetable and the name. He adds that in English gardens the cultivated form often degenerates into Smallage. Quincy, who wrote (Eng. ed., 1794) prior to 1607, the year in which the third edition of his *Complete Gardener* was published, says, in his preface "we know but one sort of it." *Celery* is mentioned, however, as *Apium dulce*, C. I. italorum in *Hort. Rey. Par.*, 1665 (Tournef., *Inst.*, 1719, 305); in 1778 Mawe and Abercrombie note two sorts of *Celery* in England, one with the stalks hollow and the other with the stalks solid; but in 1726 Townsend (Tournef., *Inst.*, 1719, 305) distinguished the *Celeries* as *Smallage* and *Sellery*, and the latter he says should be planted "for Winter Salads, because it is very hot." Tingberg (*Hort. Cultiv.*, 1764, 25) says *Celery* is common among the richer classes in Sweden, and is preserved in cellars for winter use. In 1806, McMahon (*American Gardener's Calendar*) mentions four sorts in his list of garden esculents for a New Jersey use. It is curious that no mention of a plant that can suggest *Celery* occurs in Boudæus and Salliger's edition of Theophrastus, published at Amsterdam in 1644.

The summary of our investigation hence is, that we find no clear evidence that Smallage was grown by the ancients as a food plant, but that if planted at all it was for medicinal use. The first mention of cultivation as a food plant that I note is by Olivier de Serres, 1623, who calls it *Ache*, while Parkinson speaks of *Celery* in 1629, and Ray indicates the cultivation as commencing in Italy and extending to France and England. Targioni-Tozzetti states, however, as a certainty that *Celery* was begun to be grown in Tuscany in the sixteenth century. The hollow *Celery* is stated by Mawe (Mawe and Abercrombie, *Gardener*, 1778) to have been the original kind, and is claimed by Cobbett (*American Gardener*) even as late as 1821 as being the best.

The first *Celeries* grown seem to have differed but little from the wild plant, and the words *Celery* and [cultiva]d] Smallage were apparently nearly synonymous at one time, as we find cultivated *Ache* spoken

of in 1623 in France, and at later dates *Petit Celery*, or *Celeri a couper*, a variety with hollow stalks, cultivated even at the present time for use of the foliage in soups and broths. Among the earlier varieties we find mention of hollow-stalked, stalks sometimes hollow, and solid-stalked forms; at the present time the hollow-stalked forms have become discarded. Vilmorin (*Les Plantes Potagères*) describes thirteen sorts as distinct and worthy of culture in addition to the *Celeri a couper*, but in all there is this to be noted, we have but one type.

A curious circumstance is that Smallage took on the appearance of *Celery* before its use was commonly recorded, if at all, as a salad plant, as is evidenced by reference to old authorities. The figure (not here reproduced) is substantially the same as that in Fuchsius, 1542; Tragus, 1552; Pineux, 1561; Tabernaemontanus, *ic.*, 1590, or Gerard, 1597, and Dodonæus, 1616, and is taken from Matthioli's *Commentaries*, 1558; this represents the common expression of the herbalists as to the appearance of *Apium palmaris* at this time. The second picture is from Camerarius' *Epitome* of Matthioli's, 1558, and represents the form we call *Celery*, but hollow-stalked, as at first noticed. The third picture is taken from Decaisne and Naudin's *Manuel de l'Amateur des Jardins*, and represents the unblanched plant of one of our most improved varieties. These pictures suggest the same ideas that I have previously shown to hold true for the Dandelion, viz., that our improved strains originated from natural sources, and are not cultural in their beginnings.

Take the wild Smallage, transfer to fertile soil and protect from crowding, and we should expect increase of size to the plant; earth up for the purpose of blanching and we should expect to gain increased weight to the leaf-stalks; a long-continued selection of the best plants for seed-growers would gradually succeed in forming the solid stalked; the growing of varieties from the earliest seed would tend towards earliness; the occasional growing through accident from uric seed would tend towards obtaining a curled-leaf form with dwarf habit, &c. We may hence say that all our *Celeries* in form are not changed from the original except in unessential points correlated with size and selection. In quality *Celeries* have tended to become milder, until now some of our varieties, such as the Boston Market, are of a very delicate taste, far different from the sort spoken favourably of by Townsend in 1726 as very hot and very slow growing.

It is probable that some original variation in quality discovered in the wild plant suggested cultivation, for among a people like the Italians, with whom high aromatic taste seems popular, the strong savour of the Smallage would present little objection, if only grateful to them; or that its use was suggested by some popular idea of its value as a medicinal food, as seems probable. That there is great variety in wild plants in respect to flavour, we have every reason to believe.

Smallage, described by most botanists as a suspicious if not dangerous plant for eating, yet in Fœgia was found palatable and healthful by the sailors of the exploring ships (Ross, *Voy. to the South Seas*, ii.; Cook, *Voy.*, ed. 1769), and in New Zealand described by Forster (*Pl. Ess.*, 67) as truly pleasant and salutary for scorbutic sailors. The use in Italy as a medicinal food, and the introducing to garden culture, with blanching, &c., would improve the flavour and increase its use, and improvement once initiated and recognised would necessarily continue, and stability of type-form would also tend to continue, as the seeding habit of the garden plant is not favourable to cross-fertilisation with the wild or allied species, it being a biennial, and not usually seeding alongside of other species with which crosses might occasionally occur.

We have now in *Celery* an improved, not changed, wild plant, which does not now tend to revert to the wild form, as it seemed to have done at the first, and a good illustration of the fixity of a garden form species. The present form will undoubtedly continue unchanged for a long period, unless cross-fertilisation with another species-variety is brought to pass. It would be of garden interest to grow and cross the species-forms from different portions of the globe with our garden varieties, as analogical reasoning would suggest possibilities as yet unsuspected in practice. L. Sturtevant, in "American Naturalist" July, 1886.

FRUIT TREES AT MAIDSTONE.

AFTER a long and pleasant ride through the Kentish Hop gardens, just now so fragrant and richly hung with golden floral pendants, we alighted at Barming station, close to which a new addition of some 300 acres has just been made by Mr. Bunyard to his nursery. From the station, therefore, under that gentleman's guidance, we stepped at once from the railway on to the fruit tree quarters, close to where a number of active men are employed budding Apple stocks. This is the first crop of nursery stuff in the new ground, a large portion of which has been under corn and roots, but which will be largely planted up this winter. The Allington Nursery, now close upon 100 acres in extent, is situated upon a broad and elevated plateau, the which gently slopes down to the valley of the Medway. The subsoil is chalk, and much of that in which the trees are growing so admirably seems to consist of pulverised ragstone, and which possesses in a high degree the merit of producing short, solid, well matured growth and early fruitfulness. Although the Hop-picking has begun yet the sun shines down upon us with almost torrid force, and renders the exertion useful to see all that is to be seen in this forest of young trees exceedingly exhausting. And yet it is noteworthy that in spite of this unusual autumn heat and drought nothing here suffers—nay, does not even flag. If the soil is not deep, at least it rests upon a cool bottom, so that the roots never suffer.

There is also another valuable element found in the admirable surface cultivation adopted, for in all the vast areas of trees of all sizes the rows range from 2½ to 3 feet apart, and through these all the season the horse-hoe, drawn either by the perennial donkey or a well-behaved pony, is perpetually in use; thus the soil is not only kept clean, but also loose on the surface, and a loose fine surface is a powerful counteraction to drought. Of course, only high-class work in planting could enable this form of cultivation to go on, but that is so perfect that in rows of hundreds of trees not a divergence from the straight is visible.

Although considerable numbers of choice shrubs and trees are grown at Allington, especially fine specimens *Conifere*, variegated *Hollies*, &c., yet the chief feature is found in the fruit trees, as is evidenced by the fact that some 100,000 Plums, 75,000 Apples, and 40,000 Pears, with *Cherries*, *Peaches*, *Nectarines*, *small Nuts*, *bush fruits*, &c., in similar proportion, are usually in stock.

Placed in the midst of one of the finest fruit-growing districts in England there is naturally great demand for market kinds, and Mr. Bunyard is justly famed in the market trade for his stocks of these—stocks that are not merely true, as the crudest observer may, in looking over the various breadths, easily discern, but consisting of first-class stuff; indeed, if one feature more than another marks Allington soil, it is found in the splendid growth made, and the beautifully clean character of the trees throughout. It is no mere complimentary phrase employed, when it is asserted that better for its years cannot be found in the kingdom.

PLUMS.

Turning to the great stock of Plums, we pass breadth after breadth of *Victorias*, chiefly standard, really in enormous quantities; also *Diamond*, *Czar*, *Rivers' Archduke*, a new and late purple Plum, and a great cropper; also *Green Gage*, *Washington*, *Bush*, a favourite market kind; *Farleigh Prolific Damson*, and many others. This latter popular fruit will increase considerably from suckers, the which cut close back the second season after planting, send up strong straight stems, and soon develop into natural standards. Although all *Damsons* seem to be bearing well this season, and the fruit crop is consequently enormous in Kent, yet none bear so well in ordinary years as does the *Farleigh*; hence its great value to the market grower.

APPLES.

Of Apples there were to be seen in all directions such quantities of dwarf trees, and in most cases fruiting so well, that intending planters of Apples should see how two and three-year-old dwarfs crop ere they purchase largely. In many of the quarters the crops of these miniature trees were simply marvellous, and the fruits truly wonderful. Little bush trees could, in some cases, hardly be seen for the wondrous fruit they bore. Mr. Bunyard carefully discriminates as to the kind of stock on which Apples

are worked, using Rivers' Nonsuch, chiefly for the strong growers, because possessing greater stoutness and more root-power. Then the English Paradise, the broad-leaved and the Doucie, all carefully selected, are made stocks for less robust kinds; but of course for standards the class is the ordinary stock. The first-named sorts are all of a dwarfing character, and conduce to restricted growth and early fruiting in a wonderful way. If the Crab is the stock for standards and posterity, the Nonsuch and Paradise enable those who plant one year to gather fruits the next, as may be seen on thousands of bush trees at Allington.

Of kitchen Apples, very fine—indeed, grand—are the samples seen so plentifully in the various quarters, and on many trees wonderful the crops of Grenadier, Lord Grosvenor, Lord Derby—three grand kinds; Lord Suffield, Ecklinville, Stirling Castle, Stone's Pippin, Pott's Seedling, Lane's Prince Albert, Domino, a newer kind and fine cropper; Histon Favourite, something like Hawthornden, but more robust; Saltmarsh's Queen, very beautiful; Cardiac, very handsome, and of a rich delicate hue, carrying dense bloom; New Hawthornden, Councillor, or Red Hawthornden; Queen Caroline, Keswick Codlin, Warner's King, and many others, all of the most meritorious and most interesting kind. Then of dessert sorts:—Mr. Gladstone, of wondrous colour; Lady Sudeley, clean and very beautiful; Worcester Pearmain, very beautiful, too; Early Strawberry, a conical Apple, nice shape, abundantly borne, and of a blood-red colour—very striking; Cox's Orange Pippin, King of the Pippins, Yellow Ingestre, Ribston Pippin, finding renewed life and vigour in the Paradise; Duchesse Favourite, Horned Pearmain, a great cropper, stand out prominently amongst the earlier kinds for colour and size of fruit. It is only possible to comprehend how wondrously suited these bushes, pyramids, and single cordons are for all sorts of growth, inclusive of standards and espaliers, by seeing them; and not merely the few but the mass, as row after row shows the same character and cropping capacity.

PEARS.

If Pears command less attention it is rather due to the fact that the Plums and Apples seem to prove most attractive, and yet whether seen in fine four or five-year trained horizontal trees for walls, in pyramids on the Quince, or in standards, they are full of interest and merit the highest and kindest commendation. Here and there grand fruits are seen of Dr. Goyot, Madame Treve, Beurré Clairgeau, Marie Louise, and other first-class kinds. Some older trees of Rivers' Fertility show that excellent sort to be a capital as it seems to be almost a perpetual bearer; this should make a popular market kind. A new American Pear—Pétite Marguerite—in shape not unlike Autumn Bergamot, and a great cropper, but early, seems to promise another valuable market kind. Some ten year old standards of the Hesse show what a wondrous and almost perpetual fruiter that popular market kind is.

MISCELLANEOUS.

Cherries worked on the Mahaleb stock show splendid growth, whilst trained trees are in abundance, and in various stages of growth. Morellos are specially good. Peaches and Nectarines are also in great force, and capital. Of Gooseberries there are in stock some 200 kinds, but Mr. Dunday is about to cut them down one-half in number, retaining only the best of these; none is so largely grown as Lancashire Lad, which is needed by planters, in thousands for market. All the finer show kinds are in stock and represented by dwarf robust bushes. Of Currants, besides whites and blacks, the most favoured reds seem to be Raby Castle, Red Dutch, and the Scotch, the bushes compact and of large firm growth. Filberts and Cob nuts are also in exceeding quantities, and well worthy the attention of growers, outside of Kent; as these are fruits which can be preserved for some time and are not exceptionally bulky, the grower can command the market to some extent. But whilst fruits, as we have shown, are the chief features here, Roses, for instance, are well and largely done, and a shift from the Kentish rag, where the wood is so well ripened, on to deep loams can hardly be productive of other than good. How beautifully the Teas grow and flower here is very evident. The stocks too, like the soil admirably, as the growth on the Manettis is splendid. Such plants so well established must carry fine growths from buds next year. Amongst

the Conifers very striking and interesting is *Pinus parviflora*, the leaves being somewhat erect, and almost having white undersides, so that the trees have a semi-variegated aspect. It is a distinct and pleasing variety, especially as seen on some 6 feet specimens. The dark-leaved *Prunus Pissardi* offers striking masses of colour here and there, and shows it to be a most valuable foliage tree. However, a trace to further description, suffice it to say that great improvements have been made during the past two years, a fine range of offices, sheds, &c., has been erected, and last, though not least, the orchard-house full of Peach, Pear, Apple, and other fruit trees in pots is a marvel in its way, and must be seen to be appreciated.

THE ALPINE GARDEN.

LINARIA HEPATICIFOLIA.—Like several other pigmy plants, such as *Mentha Regneri* and *Stachys corsica*, this miniature rock plant comes from Corsica. Their pigmy character, however, depends on the completely prostrate and creeping nature of their stems. This latter habit, coupled with continuous growth while summer lasts, determines a successive production of flowers during that period, so that while summer lasts this charming little alpine is a perpetual bloomer and never out of season. In general appearance it closely resembles our native *L. cymbalaria*, but is of much neater and denser habit, smaller in all parts except the flowers, and is altogether more refined and attractive. A lover of alpine plants would soon detect the difference and readily afford it accommodation amongst his choicer favourites in the rock garden. The cordate reniform leaves are smooth and shallowly three to five lobed, with petioles so short that the leaves carpet the ground densely and evenly, just allowing the flowers to show themselves distinctly above the green carpet. The latter are pale purple with a white and yellow palate, and when growth is proceeding vigorously at a favourable season, they form more or less continuous sheets of loom of great beauty. The plant is figured in Ledebour's *Lions*, 91. Its culture is of the easiest, and it will accommodate itself to a sunny or shady position, and loves to ramble over moist porous sandstone. The cultivator could also use it with great advantage to carpet the ground amongst spring-flowering bulbs, such as *Narcissus*, *Crocus*, *Snowdrops*, *Liliums*, and such things that occupy the ground with more or less permanency.

CALANDRINA UMBELLATA.

Although liable to be killed even in the neighbourhood of London in a severe winter, this neat and attractive species is worthy of a little extra care, even to the extent of housing it in winter in a cool greenhouse or a dry well aired frame. Dampness is as much or more of an enemy to it than cold, and any means taken for its preservation should aim at protection from a damp stagnant atmosphere. This is the more evident from the sub-succulent nature of its leaves, which are, however, less decidedly so than those of many of the annual species. The stems are procumbent and perennial, or sub-shrubby at the base, with ascending flower-stems, clothed with linear, hairy leaves, and bearing at their apex dense umbellate cymes of rose-magenta flowers of great richness of tint. If inferior in point of size to that of many annual species, this defect is more than compensated by the perennial habit of the plant, its comparatively slow, compact growth, and the intense hue of the flowers. Various annual species more common in gardens are characterised by a loose straggling habit, and greatly elongating stems, whereby they become untidy in the latter half of the season. That fault does not apply here, but, like other species and *Mesembryanthemums*, as well as various other more or less succulent things, the flowers remain open only during bright sunshine. The plant is easily propagated by cuttings or seedlings, and a stock should always be kept in reserve to make good losses by severe weather in the open ground. The species is a native of Chili, in dry rocky places about Concepcion, and in planting it out a similar situation should be chosen for it in the rock garden, with a full exposure. There is a figure of it in Paxton's *Magazine of Botany*, xii., 271.

CORNUS CANADENSIS.

The position of this plant is almost intermediate between a bog plant and an alpine proper; but a

place may be found for it on any well-constructed rockery, where it will thrive and flower satisfactorily. To do it justice—unless the position chosen is naturally pretty moist—it would be well to select a nook or corner more or less shaded or screened from the mid-day sun, and plant in a prepared peat bed. This, if it does not secure the proper degree of moisture, will, nevertheless, act as a cool medium, which, with a little attention with regard to watering in the drier parts of the season, will afford conditions near akin to those under which it grows in a state of Nature. Its near ally *C. suecica* frequents alpine moors in the northern part of this country ascending to an elevation of 3000 feet. That under notice is a native of various parts of North America, such as Kamtschatka, Behring's Island, and Labrador, so that there can be no question as to its hardiness. Most of the leaves are produced in a whorl terminating stems that seldom exceed 6 inches in height. The flowers are small, purplish-white, and insignificant in themselves, but are subtended by four large white involucral leaves that constitute the most conspicuous feature of the plant while in flower. The flowers are succeeded by scarlet berries about the size of large Peas, in which condition the plant is even more ornamental than when in flower. A figure which represents the plant very tolerably is given in the *Botanical Magazine*, t. 880. 7. F.

ANNUAL STOCKS FOR SUMMER.

If any one would get a good idea of the value of Stocks as summer bedding plants they should pay a visit to Messrs. Sutton & Sons' Portland Nursery at Reading. A large space of ground is covered with trials of the many types found in the Catalogue of this firm, and thus a good opportunity is afforded for making a selection of the best types for special purposes. If they are wanted for exhibition purposes, or for large beds, then they would probably select Sutton's Giant Branching, or Sutton's Perfection, both types of great beauty. If small beds are to be filled, or a front line is required for a border, then the eight or ten varieties forming Sutton's Superb dwarf strain will be the very things for the purpose.

Of all the many strains of Stocks every one can be termed "branching," though some are more so than others. By "branching" Stocks is meant those that send up a centre spike of flowers with its attendant lateral spikelets, but also puts forth a circle of branches from the base of the main stem, which bloom and make a charming pyramid of blossom enduring much longer than is generally supposed. The idea of a Stock entertained by some people is that of a plant having a central spike without any lateral flowers, which soon blooms and fades, and remains an eyesore so long as it is allowed to remain in the ground. In all good selected strains of Stocks—or perhaps I ought to say "improved" Stocks—the free-branching character is a prominent feature.

Stocks appear to be doing well generally this season—it seems to suit them. On every hand I see them growing freely and blooming finely—fine both in flower and colour. Probably showery and dull weather helped them, and now that some days of bright sunshine have come they look striking in the extreme, and especially so at Reading, where they are seen in such large patches.

I am quite sure that Stocks are too often grown on ground far too poor to do them justice, and thus a first-class strain is presented in an inferior and misleading character. The ground cannot well be too rich—deeply dug, and well manured, that the roots may have free play in it. Never mind if they appear to grow a little rank at first; the flowering time will come in due course, and a rich harvest of blossom will be reaped.

And I am sure that it is of great advantage to have a good light, free, friable loam, in which the seeds can be sown in the open ground in April, instead of under glass in March. The advantage is great; but as it is of no use sowing seeds on heavy ground in the open air, many are deluded from doing so. In sowing in the open air it is best to do it in drills, and thinly, as it will no doubt be necessary to thin out some of the plants. To do this in drills is a good plan, because if dry weather sets in, water can be given, and some mulching can be applied to fill up the drills later on. In thinning out the plants should

have ample space in which to develop, and then they are seen to the best advantage.

The Reading Stocks are remarkable for the very large percentage of double varieties among them; but this is doubtless true of all good strains grown in the present day. Careful selection has done wonders during the last twenty years in the way of improvement; the competition in the trade has made this an absolute necessity.

To prolong the beauty of Stocks cut away the decaying stems. It is not because the energies of the plants are required for perfect seeds that this course is recommended, because it is only the single varieties that produce seeds, but simply because the decaying spikes disfigure the plants. We must not anticipate the day when every Stock will be double, because there will then be no seeds to sow. Some double flowers—the *Zinnia*, *Hollyhock*, *Balsam*, and *Dahlia*, for instance—produce seeds, not so the Stock; and so a percentage of single flowers is absolutely necessary, or the fine strains now grown in gardens would become lost to cultivation. *R. D.*

SCOTCH NOTES.

AGAVE FILIFERA IN FLOWER AT THE INTERNATIONAL EXHIBITION, EDINBURGH.

This plant, noticed on p. 80 as belonging to Messrs. Ireland & Thomson, opened its first flowers on August 21. The scape has attained a height of about 12 feet, about 9 feet of which are covered with the opening flowers and flower-buds. There are several thousands of flowers on the spike, but it is doubtful if all will open during the brief space of warm weather that remains of the usual or ordinary northern summer. It is to be hoped some means may be devised of securing the full and successful development of the numerous flowers which are in themselves pretty enough to be decorative, if not showy. They are purple-red in colour, with a conspicuous brown-cremose bar down the centre of each division of the perianth. The ordinary public are greatly interested in the peculiar plant; it is, in fact, at the present time one of the attractions of the Exhibition.

THE CONTINUOUS HORTICULTURAL DISPLAY

in the grand hall is being well maintained by Messrs. Cocker & Sons, Aberdeen, who have a very fine collection of Roses, both H.P. and Tea varieties. As illustrative of what may be done in the cold atmosphere of the Granite City in Rose growing Messrs. Cocker may point with some pride to the splendid blooms of *Merveille de Lyon*, *A. K. Williams*, *Alfred Colomb* and others set up in large moss-covered circular baskets, containing about fifty flowers each. The Tea Roses exhibited by them are also remarkably good, being large well-developed flowers, with great purity of colour and full substance. They exhibit also an extensive collection of blooms of hardy herbaceous perennials, some of which were of somewhat rare occurrence in such collections. The most interesting amongst the rare forms exhibited were the pretty *Calceolaria Kellyana* and *C. plantaginea*, the bunches of which were so luxuriant in proportions as to suggest that the plants were thoroughly at home in Aberdeen.

Messrs. W. Thomson & Sons, Tweed Vineyard, have a large basket of magnificent bunches of their Duke of Buccleuch Grape, the enormous berries of which arrest the attention of visitors.

Messrs. Lamont & Son, Edinburgh, have staged in a most attractive manner, in pyramidal bunches, about fifty varieties of their seedling *Dahlia*—a very distinct and highly decorative display.

Messrs. Dobbie & Co., Leith, bring forward a very interesting display of their own specialities in *Dahlia*, *Marigolds*, *African*, *French* and *Scotch*; all are extra good, the *African*s especially so, being large, perfect in form and colour. *Carnations* and *Picotees* were also well exhibited by this firm. But if they had tabled nothing besides their samples of selected *Turnips* for the garden they would have conferred a favour on all vegetable growers. Messrs. Dobbie's Golden Ball *Turnip* is very fine, perfect in form and colour, but their new *White Model* is the greatest advance in white varieties that we have seen. We were less in want of improvement in yellow sorts than in white sorts. The great defect in white *Turnips* has always been felt to be the want of depth that characterised them, the desired globular form

attained apparently with ease among the yellow sorts appeared to be unattainable amongst the whites. The variety above named leaves nothing to be desired, being as fully globular in form as the well known Golden Ball, placed alongside of it.

Messrs. Laird & Sons, Edinburgh, made a good display of double and single and pompon *Dahlia*s. *A.*

ANOTHER ORCHIS WEEVIL.

In our article upon *Orchis* insects, published last year, an account was given of the various species which had up to that period been observed to infest *Orchidaceae* plants in different parts of the world, and a figure was given of a weevil which Mr. Pascoe proposed to describe under the generic name of *Acytophus*, of which, however, we believe, that no description has hitherto been published.

In an article to be hereafter published, several species of weevils are noticed belonging to the sub-family *Calandridae*, which infest *Cycads* in South Africa and Australia, in which the peculiarities of some of the species of that sub-family of weevils are alluded to as having larvae with very humped backs, and terminal appendages to the body, and which do not form any cocoon, with the fibres of the plants on which they subsist, previous to assuming the pupa state.

We have now to record the occurrence of another

FIG. 60. WEEVIL IN BULBS OF *C. FILIFERA*.

species of the same sub-family of weevils (*Calandridae*) destructive to the bulbs of *Orchids* of the genus *Ceoloygne* (*C. cristata*); although we are unable to describe the perfect beetle, the specimen having died in the pupa state. The structure of the insect in both the larva and pupa condition show satisfactorily that the insect is one of the *Calandridae*, the hunched-back of the larva and the cocoon which it forms of fibres of the bulbs of the *Ceoloygne*, agreeing with the same peculiarities in other species of that sub-family as stated in our preceding entomological article.

The larva, represented of the natural size and magnified, in our left-hand upper figures (fig. 60), resembles that of *Calandra Sommeri* in its general form as figured by Burmeister (copied in our last article), except that the extremity of the body, instead of being furnished with two semi-horny porrected points, is entire and armed only with several strong bristles (see upper right-hand figure). The larva previous to assuming the pupa state forms an oval cocoon within the hard polished skin of the bulb of the *Ceoloygne*, which it had previously excavated in the upper part for its food. The cocoon, which is carefully formed of fibres of the interior of the bulb, is represented at the upper part of our left-hand figure with the circular top of the cocoon removed. Within this cocoon the pupa, represented in our right-hand figures (the middle one showing the dorsal, and the bottom one the ventral surface of the pupa magnified) is deve-

loped. The rostrum is laid flat on the breast, with the two elowed antennæ knobbed at their tips at its sides, and resting in front of the anterior pair of legs, which, with the second pair, are also laid upon the breast; the wings and wing-covers are short, and scarcely visible in the dorsal view of the pupa, and the posterior pair of legs are also laid at rest in such a manner that the extremity of the tibiae are covered by that of the wing-covers, leaving the posterior pair of tarsi free. The body is terminated by a small, somewhat oval segment, having two apical setæ, obtuse at the tips, each terminated by two fine bristles, represented detached in the central outline of our woodcut. *L. O. W.*

PINUS EDULIS.

THE NUT PINE OF COLORADO.

The accompanying (fig. 61) is the sketch of a very old plant of *Pinus edulis*, about 40 feet high, as seen growing in Eight Mile Park, Colorado, at about 5000 feet elevation above the sea. There, as elsewhere in the same region, it occurs gregariously, but with the trees growing in very loose order upon rather dry slopes. Seen from a distance no one would suppose that it was a Pine; its short squat trunk and lurid rather leaden-coloured foliage and want of symmetry in the ramification are not familiar features of the genus, nor are the quite smooth bark and inconspicuous cones. It is, in fact, often described by travellers as resembling an Apple tree, but to realise this one must, to account for the colour, picture the Apple tree covered with "American" blight.

P. edulis is confined to the Rocky Mountains, where it extends from the latitude of Pike's Peak (39° N.), to New Mexico and Western Texas, about latitude 32° N. Throughout this range it afforded in old times one of the chief articles of food to the Indians, as its close ally, *P. fremontiana* and others did, in the "great basin" region to the west of the Rocky Mountains. It is a plant of very slow growth, yielding a white wood of a compact grain, but soft and brittle, and of which the annual rings are so very close set that it is difficult to distinguish them.

As grown at Kew *P. edulis* is an insignificant plant of thirty years' growth, and yet not 8 feet high, and younger plants show no promise of a more satisfactory future. It is often named *P. cembroides* in the older nursery catalogues, but this is a much more delicate species, whereas *P. edulis* is hardy enough. I have seen no cones formed in England.

The only use to which, as I was informed, the wood of *P. edulis* is put is for fuel, for which purpose it is said to be admirably adapted. *J. D. Hooker.*

COLONIAL NOTES.

NEW ZEALAND FORESTS.

PROFESSOR KIRK has presented to the New Zealand Government a valuable report on the various forest districts of New Zealand. Each district is separately reported on, as to its size, situation, products, cultivation, commerce, &c. As usual, the nuisance of popular names of vague application is illustrated. The most valuable timber tree is the *Kauri*, *Agathis* (or *Dammara australis*), the forests of which afford "one of the grandest sights in the vegetable world. Magnificent columns, from 50 to 60 feet to the first branch, and from 4 to 8 feet in diameter, rise in rank after rank, the bold, glossy foliage being altogether unlike that of any other tree in the forest. The timber is, perhaps, the most valuable of all the Pines, combining great strength and durability with a texture at once compact and silky, often beautiful waved, 'rhoded,' or figured, and occasionally mottled." Professor Kirk calculates that, at the present rate of consumption, the *Kauri* forests of Auckland will be exhausted in twenty-six years, but, presuming the consumption to increase yearly, in the same proportion that it now does, *Kauri* will be practically worked out in fifteen years.

The greatest care in preserving and husbanding the resources of the colony in this matter is advocated, should this warning be unheeded, a large displacement of labour will result, and the prosperity of the North island will be greatly retarded. The total quantity of sawn timber exported from various districts of New Zealand is given at 28,439,013 feet, of

the total value of £141,355, in the year 1885, of which no less than 25,694,997 feet, of the total value of £127,463, was from the district of Auckland. The quantity of Kauri gum exported in the same year is given at 5875½ tons, of the value of £399,762.

We gave an illustration of the cone and foliage of this magnificent and valuable tree in our issue for October 27, 1883, p. 525, the drawing having been originally made for us from a fine tree in the Temperate-house at Kew, by the courtesy of Mrs. Dyer.

Visitors to the New Zealand courts at the Colonial Exhibition will need no further reminder of the enormous value of some of these woods, and of the necessity of a system of effective conservancy. A corresponding list of trees supplying useful bark is given. Mr. Kirk shows how much turpentine, resin, and other products, is now utterly wasted, while large importations of these products, or derivatives from them, take place. Similar waste is allowed to occur with the very valuable Kauri gum, *apropos* of which we may state a fact that has recently been brought

"Elands Boontjes," *Elephantorrhiza Burchelli*, while the "Kumara," *Ipomoea chrysorrhiza*, a New Zealand *Convolvulus*, producing edible tubers, figured by us in a former volume, is mentioned as a success here, as also at Saharupur, in N.W. India. The insect powder plant (*Pyrethrum carneum* and *P. roseum*) have been successfully introduced.

STRAITS SETTLEMENTS.

Mr. Cantley has prepared a concise and clear report of the work of the Forest Department for the year 1885 in Singapore, Malacca, Penang, and Wellesley. Ceara rubber (*Manihot Glaziovii*), Para rubber (*Hevea brasiliensis*), and other useful plants have been introduced with fair chance of success. The more important works of the year in the three Settlements are summarised as follows:—Area demarcated, 17,455 acres. Surveyed, 8865 acres. Length of boundary opened, 61 miles, at a cost of about 62 dols. per mile, and 5 miles planted with fast-growing trees. Length of boundary kept up of pre-

who are not horticulturists are probably ignorant, that for many, possibly most, of their handsomest herbaceous plants, trees, and shrubs, they are indebted to the Agri-Horticultural Society; and that for that reason, as well as others, the Society deserves their support in both subscriptions and contributions. Observers, not scientific botanists, are now so accustomed to the great variety of vegetable life which beautifies Madras and its suburbs, and makes the gardens and roadsides interesting, that the time, labour, and money expended in their collection from every country within the tropics, and many without, escape their memories; as do the nursing and propagation by skilled hands in, and liberal distribution from, the Society's gardens. Many of the most useful and commonest plants of the hedgerow, now annually sowing themselves and reproducing their kind in spite of never-ceasing cropping and browsing by voracious goats and their hungry owners, but for the Society and its correspondents, would not have wandered here from their distant homes in other parts of India, in Africa, America, or Australia. The committee think that the past and present members of the Society may look around and congratulate themselves that their first fifty years of association have been well spent. *Annual Report.*

MARKET PLANTS.

PERHAPS at no better place can what may be called the commercial side of horticulture (as distinguished from its scientific aspect) be seen to greater advantage than at a market plant nursery. Such establishments, when on a large scale—as is the one under notice—truly cater for the million.

These thoughts are suggested by a recent inspection of a fine display at present on view, at Mr. May's nursery, Upper Edmonton, of Tree Carnations, in 48-sized pots, and in prime condition. There are in all about 20,000 plants; some are now in flower, others flowering. Taken as a whole they are about as fine a lot of plants as one would wish to find. We append names of a few of the most striking sorts:—

Miss Jolliffe, pink, very free, and one of the most popular kinds, in evidence of which it may be stated that a hundred dozen flowers of it have been sold daily, good blooms, realising 1s. per dozen in the market.

Amongst pure whites, fine varieties, are *Middle Carle* and *L'Herminie*.

In yellows, *Andalusia*, good and useful; *Tissot's Yellow*, *Pride of Penshurst*, a real acquisition, and one of the best in this section; although strictly speaking this is not a Tree Carnation, yet it may be grown with them, and will flower freely through the winter. *Bissy*, pale yellow, fringed edges, compact and free; *Chevalier*, fine.

Amongst scarlets, one appropriately named *Lucifer* is the most popular; *A. Alegatière* is very fine, dwarf, bushy habit, and free; *Duke of Albany*, and *Worthington Smith*.

Amongst crimsons we noted good desirable kinds in *Indian Chief*, *Negro*, *Burgundy*, *Dr. Raymond*, very fine; *Magnifica*, rose-pink; *Laura*, flesh coloured; *Jean Sisley*, a prettily mottled flower.

Ferns are a great specialty here, and grown in bewildering numbers and in all the most popular varieties. Of *Adiantum cuneatum* several houses, 100 feet long, are devoted to this variety alone, so great is the demand for this useful sort. *Pteris cretica*, *May's variety*, was seen in wonderfully good form; it is a fine variety of albo-lineata, very sturdy and compact in growth, of dwarf habit, and hardy constitution. *Davallia Griffithiana* is a very beautiful form, with dark green fronds, a pleasing stout, its long silvery-grey scales forming a strong contrast to the dark fronds.

Some wonderfully well coloured examples of *Crotos* were noted; the narrow-leaved section is that principally grown, being more adaptable for table work. Good varieties for this purpose are *Warreni*, *Johannis*, and *Coutess*—the latter, in fact, might be aptly described as a "pillar of gold."

Of that true market plant, *Ficus elastica*, the *India-rubber*, an enormous batch is grown; cuttings struck last spring are now sturdy little bushes from a foot to 18 inches in height.

Of *Ivies*, the beautifully silver variegated and useful sort *Hedera maderensis variegata* is represented by a very fine stock—the long lines of it having an effective and attractive appearance. When dealing

(From a drawing by Sir J. D. Hooker, in *Colarado*.)

under our notice, viz., that Kauri gum softened by heat forms probably the best material known for making models of the mouth for dentists' purposes.

ADELAIDE.

The annual report of Dr. Schomburgk is as usual full of indications of the well-directed zeal and energy of the Director. Much of the contents of the report are of course of local value only, and concern plants, many of which are pretty well known in Europe, though only lately introduced into South Australia.

From this report for 1885 we learn that during that year the rainfall was no more than 15.8 inches, or 5.2 inches below the average of forty years. The heat in the driest months—November, January—was abnormally great, the maximum in the sun being 173°, and in the shade, 113°. Such a temperature after a drought of three months duration was very injurious to vegetation, so much so that the Wheat crop was a total failure, the average yield not having been more than three bushels to the acre. In May and June a slight frost (2° or 3°) occurred. The Cheesemaker (*Withania coagulans*) promises to be a success, as also

vious year's demarcation, 46 miles. Area protected, 22,753 acres, being about an average of 1202 per watchman employed. Buildings erected, seven, being four permanent and three temporary. Area planted, 59 acres; weeded, 64 acres. Weeding and planting taken together cost about 13 dols. per acre. Number of plants propagated, 180,000, at an average cost of 9 dols. per 1000. Number of specimens for Colonial and Indian Exhibition, 271. Number of herbarium specimens collected, 4389. Seeds collected, 300 lb. Received from India, 86 lb. Number of prosecutions for illicit tree-cutting, twenty-three. Number of convictions obtained, fifteen. Area added to nurseries, 9 acres.

AGRI-HORTICULTURAL SOCIETY OF MADRAS.

The year just concluded was the Jubilee of the Society, it having begun its work on July 15, 1835, and nobody familiar with the Society's gardens and their very great wealth in exotic plants collected from every quarter of the globe, would suggest that the half century has been spent in sloth. Horticulturists in Madras are apt to forget, and those

with the flowers, mention was omitted to be made of these good varieties of Bouvardia, viz., *Humboldtii*, *complanata*, *calycidiscata* and *juniflora*. Of the first named sort, which is the largest white, a house 100 feet long is devoted to its culture; as most of the plants are now in bloom, the effect produced on the visitor is, as may be imagined, in the nature of a surprise.

The perfume emitted from such an assemblage of sweet smelling subjects is almost overpowering.

A concluding note to this necessarily hasty and inadequate sketch may be found in recording that the old double white *Camellia—alba plena*—is represented by some sturdy specimens now in flower, some of the individual blooms giving the idea of snowballs, so fine are they. *Azlea Fieider's White* is another good thing. It is the only variety grown, and indeed it would be difficult to beat for market purposes. *B.*

FORESTRY.

PREPARATORY TO PLANTING.

FIRST of all we would seriously urge that as the time is fast approaching when planting operations will demand attention, all work necessary for the preparation of the ground be forwarded as quickly as possible, including fencing, draining, removal of scrub, holing or pitting, and trenching. The first requisite to successful planting is a fence impervious to farm stock generally—cattle, horses, and sheep; and this, according to circumstances, locally considered, may either be formed of stones, continuous iron and wire fencing, or the more commonly adopted estate fence of wood and wire. Where mountain sheep abound have the fence, at any cost, made sufficiently high to prevent their inroads; for once an entrance is effected, the better grass and greater amount of shelter afforded by a wood or high-lying plantations are such enticements that to put a stop to their inroads is a task of no small trouble. The advantages of early pitting are of great importance, the soil thrown out being ameliorated by exposure, and consequently well fitted for placing next the roots of the young tree when planted out. Form the pits, if for plants of ordinary size—say 12 inches to 24 inches high at 4 feet apart, the size of each being 16 inches diameter by 12 inches deep, the bottom and sides being well loosened with a pick. Previous to pitting, all rough herbage should be cleared from the ground and burned, and drains formed to carry off stagnant water where it is found.

THINNING.

Overgrown plantations of small size may now be thinned, this operation being performed in a manner suited to the exposure, and should in every case be lightest upon the margins which are in the direction of the prevailing winds. Where the plantations are not of importance as game covers, the trees may be allowed to stand thicker than usual, indeed by the preservation of a leafy canopy, the size and thickness of poles is equalised in a very marked degree.

THINNING SOFT-WOOD PLANTATIONS.

We are at present thinning a 90-acre plantation of mixed Larch and Scotch Fir and a few Douglas Spruces, of twenty-five years' planting. The soil is good, a free sandy loam, but the exposure and elevation are rather against the production of good timber, the lower portion of the wood being 700 feet and the upper fully 1000 feet above the sea-level, while being situated on the flank of one of the Snowdon spurs, the south-west winds tell somewhat severely, more particularly at the higher elevations.

No thinning has taken place for upwards of ten years, and the poles, of fully 9 yards in length, are clean, and as straight as a gun-barrel, and destitute of live branches for three-fourths their height. Had the wood been regularly thinned, and the trees allowed to branch to the ground the poles would certainly not have commanded the same price as by the course of management they have undergone. Unless in the case of small plantations, it is good policy to finish up a portion of the woodland, so that game driven from the other parts may find a shelter where they will not be further disturbed. For this purpose, we would suggest that all timber, poles, firewood, and

branches if they are required, be conveyed to the clearance roads, or, better still, where such is convenient, to pasture fields or alongside roads contiguous to the plantations. This will allow the portions thinned to be not again entered and so do away with the chances of game disturbing, which, as most foresters know, is an unpardonable fault in the eyes of the keepers of such.

PLANTING EVERGREENS.

These may now be transplanted with a great amount of success, especially when dull, dampish weather is chosen for the operation.

For renovating shrubberies, planting up thin woodlands, or thickening game covers this is a capital time, and such work will be well over before general forest planting commences. Dig the holes intended for the reception of those of a large size, say, a couple of feet in diameter by 18 inches in depth, and do not plant too thickly, but at such a distance that the outer branches will be quite free from each other. Frequently in the formation of game covers, and where immediate effect is desirable, we plant doubly thick, and when the plants, in two years or so afterwards, begin to encroach on each other every alternate one is removed. Box, Laurel, and Laurustinus suit this method of management well. A great mistake is frequently made both in planting evergreens for ornament and covert for game by over-doing the work, that is, by planting the various clumps in too close proximity. Game, particularly pheasants and rabbits, detest such, but enjoy free open spaces between the clumps, and for this reason, as well as the more ornamental appearance imparted to the woodlands by nicely laid out, irregularly shaped masses, it behoves the planter to use a little timely discretion in the laying out and planting of such. *A. D. Webster, Penrhyn Castle.*

BELLADONNA AND GUERNSEY LILIES.

THESE two names, given respectively to two beautiful flowering bulbs, I have reason to know are considered by some amateurs to belong to one and the same plant. Growers know that, though much alike in habit of growth, the actual blooms differ greatly. Why either is called a Lily it is difficult to understand, as both belong to the natural order *Amaryllidaceae*, and are not akin to *Lilium* proper. Nor are they intimately related to each other, botanists having chosen to name the former *Amaryllis*, and the latter *Nerine*. The former is an African bulb from that part of the world so rich in bulbs—the Cape of Good Hope; and the latter is a Japanese plant, though named *Nerine sarniensis*, and supposed by many to be indigenous, or to belong to Guernsey. It would be interesting therefore to know how this name originated, and along with it the facts of its origin. The Guernsey Lily is the more showy of the two, though, like the genus it belongs to, the petals are sparsely arranged and narrow, with the pistil and stamens projecting greatly, in a similar manner to the smaller-flowered *Nerines*.

The flowers of the Belladonna Lily, borne upon stout, upright stalks, are more compact and numerous, and have a white groundwork flushed with dark rose around and at the margins of the flower; the colour of the Guernsey Lily is, on the contrary, of a crimson-scarlet. There are further peculiarities to be noted in regard to each. Unlike most other bulbous plants of apparent similitude, they appear to rest during our summer season, push forth their bloom-spikes by the advent of September, and subsequently make leaf growth, the Guernsey Lily being the first to show leaf activity. For this reason dry bulbs of both are only offered at the autumn season of the year, these being probably introduced from Guernsey, the climate of which island seems to be suited to their wants. Such bulbs when purchased rarely seem to do well after the first year or so. Experience shows that success is possible with them, nevertheless, under suitable treatment, the bulbs require uniformity of moisture, and hence do far better in borders than in pots. The only position suitable for them out-of-doors in this country is at the foot of a wall having a warm aspect; better still, the front border outside a hothouse which has a flue for heating, the flue imparting some warmth to the earth in its vicinity. In other words, what is really required is an inducement

for the bulbs to make an earlier start into flower and growth than is furnished by the warmth of the ordinary garden borders. This being the season when fresh imported bulbs are purchased, they should be potted as soon as received, and watered freely, for notwithstanding the bulbs are devoid of roots, they, unlike some other kinds, do not suffer from excess of moisture. *William Earley.*

The Apiary.

GENERAL DIRECTIONS.

THE lazy bees I spoke of in my last article are working harder and harder. I have still further improved their circumstances by taking a weak stock of bees which could hardly have got through the winter unassisted, and added them to these now industrious bees. And this remark will hold good at all times, that next to keeping the bees dry in winter the "best packing for bees is bees." I forget who made that remark, but it is sound and good, as I have proved. Therefore take care that you have plenty of bees in all hives which are going to remain, and also have a laying queen. If anything has happened to the queen of a hive, or if you are not satisfied with the reigning queen, do away with her, and then add the remaining bees to a hive that has a small population. It is as well also, while you are doing all these things, to have an eye to the future. From various experiments I have made I think that reversing hives or frames (which is the same thing) is a good thing under certain conditions, and if done at the right time. I know this is a disputed point, and if you do not think it prudent to go through with the whole lot, try one or two hives. I will describe briefly what I am doing.

At this season I have plenty of empty combs which have been relieved of their contents by the extractor. I cut these combs clean out of the frames, and fit them into my reversible frames, and then mix two or three lots of driven bees together and put them into a hive thus fitted up—the queens to fight it out in the usual manner. Then feed up quickly for winter, but do not give them more syrup than they can comfortably seal up, as unsealed syrup must never be allowed in winter. To save correspondence these frames are to be obtained at Messrs. Edey & Son's, St. Neot's, Hunts, at a reasonable rate and soundly made. Then leave all alone till spring. At the usual time (*i.e.*, about the middle or end of March, according to the weather) examine the hive and see if food is required. If it is not, close the hive again till swarming time, but if the bees are short of food gently feed till honey is coming in. When the bees are about to swarm reverse the frames, and put on supers. If done as I have explained there will be a general stampede to the supers, and the honey at the bottom of the hive will be hastily carried to the top, and the queen will have more room to lay. This will prevent any hanging out and consequent laziness at swarming time. I fancy I hear some one say, "Why did you not do that with the lazy bees?" The answer is, that the hive did not contain the reversible frames. *Walter Chitty, Pewsey.*

The Flower Garden.

CARNATIONS, &c.

CUT the old blooms off Carnations as soon as their beauty is over. Young plants of these and Pinks which are sufficiently rooted may now be planted permanently in the beds or situations it is intended they should occupy, or, if this is impracticable, they may be transferred to nursery lines, taking care not to overcrowd them, but to allow sufficient space between each that a large ball may be secured to each plant when they are again transplanted. They may also be potted into 3 or 4-inch pots, and the pots plunged out-of-doors.

ROSES.

Those stocks which have been budded should be examined to see if the buds have taken. Those that

have united should have the ties removed and the shoots shortened back to throw the full strength into the buds. Maréchal Niel succeeds well budded on Gloire de Dijon. Roses which are associated with shrubs and herbaceous plants are in constant danger of being robbed of their due share of moisture at the roots. Unless special attention be bestowed upon plants in such positions, to secure them an ample supply of manure-water, the wood for next season's flowering will be in anything but a satisfactory state. Do not allow mildew to obtain a footing, but as soon as it is discovered take steps to subdue it.

BIENNIALS.

Get Wallflowers, Sweet Williams, Rockets, Brompton and other Stocks, &c., transferred to their permanent quarters with all haste. The long nights are now more favourable for these subjects obtaining a hold. Where Foxgloves are grown in borders a quantity of young seedlings will be distributed around. Instead of destroying those, let any bare place in shrubbery or woods be forked up and the seedlings transplanted. They will be very ornamental when in flower if grown in large masses together; thus unattractive spots may be made beautiful by a little labour. *William M. Baillie, Leven Hoe Gardens.*

THE ORCHID HOUSES.

POTTING CATTLEYAS AND LÆLIAS.

EXPERIENCED growers require no teaching how best to pot, but a few hints to beginners may be useful. Turning Orchids out to repot them should always teach the operator a lesson, especially when many of the plants have been bought in, and may have been potted by different people in various ways. Many of the Cattleyas will grow very well on a block or raft, if in a humid atmosphere during their growing season, but there is a wide difference between growing a plant on a bare raft or block, and then taking it off and potting it in 3 to 6 inches of peat and sphagnum. If the peat be good I consider this a great waste. Those who have grown plants other than Orchids may have an idea that plenty of good peat, &c., about the roots would be the means of helping Cattleyas to make fine pseudobulbs, but I have never found this to be the case. I have also made experiments with different manures for Cattleyas and a few other epiphytal Orchids, mixed with the compost for potting, and sometimes hid on the drainage, but I have never gained anything by it. Some manures will soon make everything in the pots in such a state, that no roots can live; and I would say to those who are guided more by advice given, than by practical experience, that when they see measurements given of pseudobulbs and leaves of which the plants have been fed with manure, to first measure their own plants, and if these are found to be not far behind to let well alone. I think the safest manure for all epiphytal Orchids is from evaporation by damping a bed of Oak leaves in the evening with manure-water, then the aerial roots can take in quite as much as will be good for the plants.

Returning to my remarks on potting, our system is very simple. We free the roots of the old potting material, cut away all dead ones, then take the new pot; before putting in any drainage, place the plants over the pot a little above the rim, holding a stake and one of the bulbs in one hand; the stake should rest on the bottom of the pot. Having ascertained the height, take the plant and stake out together; secure the latter firmly to the bulb with two ties, adding one or two more stakes if necessary; again set the plant over the pot, letting the stakes rest on the bottom of the pot; then commence putting in the drainage—this should be new crocks—placing them carefully round the roots, at the same time fixing the stakes; fill the pot to the top with crocks, and then pack a thin layer of good fibrous peat and sphagnum over the top; damp the surface and outside of the pot, and if the weather be dry keep the moss fresh by damping. Potted in this way the plants keep their roots better through the winter, and there is less danger of over-watering. It is very important that new potted Cattleyas and Lælias should be well secured with stakes, for if they get disturbed just as the roots are starting the plants will suffer. Large specimens do not require so much fixing. *C. Woolford, Downsides House, Leatherhead.*

THE BULB GARDEN.

EARLY FLOWERING GLADIOLI.

Few plants possess greater merit than do the varieties of the particular forms of Gladiolus known popularly as the early-flowering. Unfortunately it is not too well known—especially amongst amateur growers—that they are hardy and able to withstand severe winters in the open border. They will grow readily in ordinary soils, increasing freely, and will, if left undisturbed, push forth each spring in greater quantity, blooming as early as the months of June and July. Doubtless the older communis and Byzantine, or Turkish variety are known to many a cottage garden, having been introduced almost concurrently with the seventeenth century. It is not to these species, nor even the later cardinalis (a beautiful form), I wish more particularly to refer, but to the several modern introductions, which, independently of the above merits, possess such beautiful combinations of colour. First, however, I would refer to the lovely white-flowered form—Colvilli alba (The Bride), which has such dwarf habit and great freedom of flowering as to make it indispensable in every garden. In the original species, or Gladiolus Colvilli, we have a lovely striped flower, consisting of white stripes upon a variously shaded rosy-purple ground. More recent improvements consist of a white flower with crimson blotch, Delicatissima; M'ry Anderson, blush-white, carmine-red blotched and lemon colour; Premier, vermilion-scarlet with white blotches; Duke of Albany, dark scarlet with purplish blotches; Prince Albert, shaded salmon, with distinct white blotches on inner petals; Rosy Gem, shaded rose, each petal having a white blotch surrounded with crimson. I would also note an improved form of the old Racemosus, named Ne Plus Ultra, of deeper colour than the original, being instead of rosy-pink a pleasing red, flaked, as in the original species, with white.

Beyond the merits claimed for these early flowering Gladioli, they are useful grown in pots for spring decoration of the conservatory. Potted soon after the New Year, and placed on shelves exposed to full light, they attain to sufficient vigour to admit of a slight amount of forcing if necessary, though they will bloom in April and May under greenhouse treatment. The corms are small compared to those of Gandavensis, so that some half dozen in a 32 sized pot will have ample room to develop their growth. The white-flowered variety of G. Colvilli, commonly known as The Bride, is extensively grown for market purposes, being in good demand by bouquet makers; indeed, wherever cut flowers are used the chaste spikes of this variety are duly appreciated. Species that have been in the ground constantly, commence growing each spring, in accordance with the warmth of the weather. Purchasers will, however, do well to plant new corms between the end of October and December. A sound sandy loam, enriched with decayed manure, forms the best compost for them. *William Earley.*

RATE OF INCREASE OF NARCISSUS BULBOCODIUM.

Five years ago I planted half-a-dozen bulbs of this Narcissus in a well-prepared rather dry and shady bed. Last week they were lifted, and had increased to 119, being an average increase for each bulb of four per annum. The Tenby Dafodil (N. ovalvaris), in the same bed, but in a moister part, has increased at the same rate. *A. D. W.*

PLANTS AND THEIR CULTURE.

CHRYSANTHEMUMS.

LAYERING the shoots of planted-out specimens should be attended to at once. Place some open rich soil in mounds around the plants at some distance away from the stool, as in Carnation layering, then strip the leaves off at the place it is intended to layer the shoots, which should be a little below where the flowering laterals branch out; tongue the shoots—that is, split them up longitudinally for about 2 inches, then, bending them downwards, bury the tongue part for about 8 inches in the hill of soil, making secure with stout hooked pegs. Keep the soil regularly watered, and in a few weeks the layered shoots

will have formed a quantity of roots, when they may be severed from the parent plants, and potted. In this way a large quantity of blooms can be obtained from plants of small size. Plants in pots should receive their final ying, using sufficient stakes to keep them from being broken by the wind, and as soon as the flowers are set thin out the shoots, as it is a mistake to crowd the lateral flowering shoots even for ordinary decorative purposes, as the size of the bloom is much reduced by so doing. Give plenty of manure-water to these plants, as they will take it in stronger doses than most others.

CINERARIAS, CALCEOLARIAS, LILIUUMS, &c.

Cinerarias, to come in early, should now be potted on by being shifted into larger pots, using light rich soil. The best compost for them is made with good fibrous loam, leaf-mould, and dry cow manure, using a liberal addition of sand. Place them in a shady pit on a cool bottom, and syringe them once or twice a day, according to the weather, to keep them free from red-spider, to which pest the plants are much subject at this season of the year. Herbaceous Calceolarias should now be in a sufficiently forward state to be pricked out into pans or boxes, or to be potted off singly into small pots; the situation and treatment may be similar to those employed for the Cineraria, but in the potting material less manure should be used at starting. Syringe freely overhead, and keep close for a time. Liliums of the lancifolium section, and other late-blooming species, which will now be in full beauty, should be liberally treated with manure-water at every watering. The earliest blooming sorts, viz., L. auratum and longiflorum, should be placed out-of-doors as the plants go out of flower, and be careful not to dry them off too quickly, and, on the other hand, not to over-water them, as these are more bulbs killed in this way than in any other. Other late bulbous plants in bloom should be liberally treated. *A. Evans, Lythe Hill, Haslemere.*

FRUITS UNDER GLASS.

PINES.

FRUITING plants should be given a day temperature of 75°, running it up 10° higher with sun-heat, and plenty of air. Maintain a night temperature of 70°, and damp the floors, walls, and plunging material morning and afternoon at closing time, to promote a genial atmosphere.

Examine the plants every week or ten days to ascertain their condition at the roots, and when dry give sufficient tepid liquid-manure in an under rather than over strong state, to thoroughly moisten the soil, afterwards allowing it to become moderately dry before repeating the application—over-watering being an evil to be avoided in most cases, but particularly so in Pine culture.

SUCCESSIONAL PLANTS.

These will now, or ought soon, to have completed their growth; they should then be subjected to a lower temperature, and a drier and more airy atmosphere, so as to prevent the plants from making further growth, and in consolidate that already made, as well as to give the plants a period of inactivity before subjecting to a higher temperature towards the end of the present year, with a view to inducing the plants to send up their fruit. During the interval water must be applied both at the roots, and in the house or houses containing the plants with judgment and care. The night temperature for these plants should range from 60° to 65° during the next four or five weeks, and 5° to 10° higher by day should be aimed at. Young sucker plants should be kept in a growing state for another month or six weeks. All shading should now be dispensed with, and be put away dry and out of the way for use another year.

VINES AND VINERIES.

These should have a free circulation of fresh air allowed them day and night, and in order to prevent birds from getting at the Grapes a piece of garden netting should be put over the ventilators. See that the Vines in every stage of growth have liberal supplies of water at the roots when necessary, and that the floors and the surface of internal borders of houses containing Grapes are damped over slightly two or three times a day during bright sunshiny weather, and that the Vines from which the fruit has been taken are thoroughly syringed overhead every afternoon, so as to prevent the spread, if not the attacks, of red-spider on the foliage. *H. W. Ward, Longford Castle.*

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY,	Sept 6	Sale of Dutch Bulbs, at Frotheroe & Morris' Rooms
		Sale of Greenhouse Plants, at Parkside, Ewell, by Frotheroe & Morris.
TUESDAY,	Sept 7	Sale of Bulbs from Holland, at Stevens' Rooms
		Royal Horticultural Society: Meetings of the Fruit and Floral Committees, at 11 A.M.; and Show of Grapes, Dahlias, &c. (two days)
WEDNESDAY,	Sept 8	Sale of Greenhouse Plants, at the Queen's Road Nursery, Buckhurst Hill, by Frotheroe & Morris.
		Sale of M. August van Geert's Orchids, by M. Jules de Cock, (eight two days) (Glasgow and West of Scotland Show)
THURSDAY,	Sept 9	Sale of Stove and Greenhouse Plants, at the Nursery, Beaufort Street, Chelsea, by Frotheroe & Morris
		Sale of Dutch Bulbs, at Holland, at Stevens' Rooms
FRIDAY,	Sept 10	National Chrysanthemum Society's Show of early Chrysanthemums, Dahlias, &c., at the Royal Aquarium (two days)
		Sale of Dutch Bulbs, at Frotheroe & Morris' Rooms
SATURDAY,	Sept 11	Sale of Stove and Greenhouse Plants, at the Exotic Nursery, Chigwell, by Frotheroe & Morris
		Sale of Imported Orchids, at Frotheroe & Morris' Rooms
		Sale of Dutch Bulbs, at Frotheroe & Morris' Rooms
		Sale of Dutch Bulbs, at Stevens' Rooms

SOME of the most interesting and important investigations of late years have been those relating to the various FUNGI to be found in the ROOTS of PLANTS of all kinds, and not the least curious of the results is, that some of these root fungi appear to be constant and possibly harmless, or even (as it is said) advantageous guests in or on the tissues of their underground shoots. In other cases it is true the roots would obviously thrive better without their unbidden intruders, as, for instance, those attacked by the parasitic fungus (*Plasmodiophora brassicæ*), which causes such havoc in "clubbing" or distorting the roots of Cabbages and other Cruciferæ, or the devastating mycelium of *Agaricus melleus* so destructive to the roots of the Conifere and other forest trees.

Nevertheless, to say nothing of the recent startling announcements as to fungi acting in beneficial concord with roots, it has long been known that certain swellings on the roots of Alders, and of various Papilionaceæ and Orchids, are constantly met with, and appear to do no extensive damage. How far the plants named would be benefited by the removal of the parasites from their roots has never been clearly shown.

An important contribution to our knowledge of the FUNGI infesting the ROOTS of ORCHIDS has just been made by WAHLRICH of Moscow.* Working in the world-famed laboratory at Strasburg, WAHLRICH has examined more than 500 species of Orchids, native and exotic, and finds the fungi in all of them. These root-fungi have been known in Orchids since SCHLEIDEN first examined them, and many of the best observers (e.g., SCHACHT, REINKE, EIDAM, &c.) have confirmed the fact of their universal occurrence, and more or less thoroughly described the mycelia and spores. WAHLRICH has, however, cleared up several obscure points, and has now given a fairly complete account of the life-history.

Only certain parts of the roots of the Orchids are infected with the fungus, and these places are usually yellowish in colour, due to the spawn or to the degradation of chlorophyll corpuscles (in aerial roots); the vascular bundles are not attacked, the fungus being confined to the outer cells (velum) and the parenchyma.

Sections through the infected spot show brown dead or dying threads in the outer cells, continuous with colourless living threads, which branch and pierce through the walls from cell to cell. A curious feature exists in the yellow clumps found in certain cells of the root. These are relatively large, simple, or branched bodies, long thought to be masses of mucilage, or, at least, cell-contents belonging to the Orchid itself; they are strongly refractive, irregular in shape, and are connected with the threads of the fungus. WAHLRICH has

not only satisfied himself that these clumps are not normal cell-contents of the root, but that they have a structure and relations which show them to be of the nature of large suckers, or absorbing organs. They only occur in the parts attacked by the spawn, and are continuous with the threads; more than this, the older ones are composed of a tangle or coils of threads, enclosing a sort of sac (the haustorium or sucker). This sac may branch and become connected with others; threads may also spring from it and pass into other cells. The above fungus, spreading from cell to cell by means of its spawn, which forms the haustoria-like sacs with their tangles of threads around them, produce spores. Sections of infected root were placed in diluted Grape juice, and the spawn allowed to grow out from the tissues. The threads often grow together where in contact, and they produce spores or conidia at their tips; these conidia are delicate, colourless, sausage-shaped bodies, with two or three partitions across them, and resemble the conidia of a *Fusisporium*. After forming one of them the tip of the thread goes on growing, and forms another, which falls off, as before, and is succeeded by others, and so on.

After producing large numbers of these *Fusisporium*-like conidia, the same spawn commences to form larger spores (megaspores) of different shape and colour. These also are formed at the tip of the thread, but whereas the delicate hyaline, sausage-shaped *Fusisporium*-like conidium is at first one-celled and becomes divided into chambers later, these larger brown megaspores (which have strong membranes and contain much fat) are formed, as it were, by the end of the thread becoming successively segmented into two, three, or more compartments, which then swell and ripen. The megaspores appear to be resting-spores.

The *Fusisporium*-like conidia germinate very readily—even in a few hours. If placed in a nutritive solution they form a copious spawn, which soon forms both kinds of spores as before, and the branches of the spawn often conjugate. These processes have been observed in the fungi from several different Orchids.

Pieces of infected root were carefully washed and kept in damp chambers. In a week or so the spawn came out to the surface, and developed spores as above. After about a month the spawn produced capsules or perithecia of a bright red colour, shaped like an egg or Pear. In these perithecia were developed spores of asci, each containing a number of two-celled ascospores. Slight differences were observed in the sizes and shapes of the perithecia and spores obtained from the roots of different species of Orchids, but these are not important.

The ascospores were sown separately, and produced spawn on which the same *Fusisporium*-like conidia and megaspores became developed as above described.

Infection experiments have so far failed. Neither the *Fusisporium*-like conidia nor the ascospores have yielded satisfactory results, their spawn in no case penetrating into the young roots used. The megaspores may possibly yield better results; the author says nothing of this, however. Obviously, there is here a task for investigators, for if WAHLRICH'S view is correct (that the megaspores are resting-spores), it will be important to ascertain how they behave on germination.

In conclusion, it appears probable that more than one form of fungus is parasitic in the roots of Orchids, but the differences, so far, only point to their being members of one group, probably species of one genus.

The above fungus is obviously a pyrenomycete. The red capsules or perithecia, sometimes grouped in threes or fours, and on a reddish-brown stroma; the asci, each contain-

ing eight spores, which are elliptical, two-celled, and slightly constricted in the centre; these, and other peculiarities, suggest their being species of *Nectria*, and WAHLRICH therefore characterises two species—*N. Vandæ* and *N. Goroshankiniana*. What relation, if any, these fungi have to *Orchid "spots"* of various kinds remains to be determined.

OLEARIA MACRODONTA.* — According to the estimate of the authors of the *Genera Plantarum* there are eighty-five species of the genus *Olearia*, of which some sixty-three are Australian, and the rest natives of New Zealand or the adjacent islands. The species here figured (fig. 62) is, as pointed out in the synonymy given below, a native of New Zealand, and must not be confounded with the Australian *O. dentata*, a widely different plant, with much handsomer flower-heads. In all probability the last-named plant is not nearly so hardy as the one here figured, which has been comparatively recently introduced to this country by Messrs. VEITCH. As far as foliage is concerned, it is superior to the Australian plant above mentioned, and the following copy of a collector's note gives a good idea of the appearance of the tree at home:—"Grows to a large-trunked tree, 20 feet high, 30 inches in diameter for 3 feet, then dividing into three or four branches to 12 inches in diameter. It forms a flat round head, all white when in flower. The wood makes rather fairish veneers with yellow streaks." The foliage, in common with that of several other species, has a distinctly musky smell, which in *O. argophylla* is much more decided in a dry state than when fresh. Like the plant just named, *O. macrodonta* will no doubt thrive well in the South-western Counties, the Channel Islands, &c., and form a beautiful tree in the open without any protection during winter. *O. Haastii*, from New Zealand, is perfectly hardy about London, and is one of the very best of flowering shrubs. Whether *O. macrodonta* will prove as hardy as *O. Haastii* or not remains to be seen. The specimen figured came to us from Mr. W. E. GUMBLETON, who describes it as "perfectly hardy, a most profuse blooming and exceedingly ornamental shrub." It is also hardy at Combe Wood.

"THE FLORA OF BRITISH INDIA."—We are glad to announce the publication of the thirteenth part of this very useful work. The present part is entirely the work of the editor, Sir JOSEPH HOOKER, and comprises the Chenopods, Polygonads, Aristolochiads, Nephtheds, Pipers, Laurels, Loranthids, and other orders. The Piperaceæ must have caused much labour, and we may add worry. Many of these plants cannot be satisfactorily studied in a dried state, but need to be investigated in every stage of growth by resident botanists. The summary here given will, however, be of the greatest service to them, and botanists generally will congratulate Sir JOSEPH on the steady progress of this important work. The Euphorbiaceæ which come next would present terrors to many less experienced botanists, but will not affright Sir JOSEPH HOOKER.

BERBERIS ASIATICA AS A HEDGE PLANT.—Those who wish for a quick growing, easily managed, and impenetrable hedge, should see the one at Combe Wood, formed of this plant. We do not know what the stock may be, but no doubt it is easily propagated, and if so, is well worth the attention of hedge planters.

KREW.—The Nymphaea-house is full of beauty at this season, many plants in the tank being in bloom, viz., *Nymphaea odorata*, and the lovely rose-coloured variety, *N. Lotus*, with white flowers; *N. L. Ortgiesiana*, rose-coloured; *N. gigantea*: the delicate blue flowers of which are larger (than in other species, the petals longer in proportion to the stamens than in most species, and, what we have not observed in any other species, they are slightly recurved; *N. stellata*, with blue flowers; *N. Lotus pubescens*, with rosy-pink flowers; *Nymphaea zanzibarensis*, a form of *stellata*, is remarkable for its rich blueish-purple flowers. *Limnorcharis Ilumboldtii* was showing many of its yellow flowers

* Baker, in the *Gardeners' Chronicle*, n. s., xxi., 604; *O. dentata*, Hook. fil., *Handbook of New Zealand Flora* (not of Mieneh).

in this tank. In a corner bed *Sagittaria montevicensis* has thrown up strong flower-stalks, 4 to 5 feet high, terminated with spikes of white flowers, three-petalled, spotted with brown at the base of each petal. The singular *Cucurbit*, *Trichosanthes anguina*, loaded with fruits, many of which have acquired the brilliant scarlet colour of the ripe stage, cover large portions of the roof. Another plant seldom seen doing well in private collections is *Pteroma macrantha*, which is here

beds of Hollyhocks, Sunflowers, Delphiniums, Japan Anemones, and other striking plants, each in a bed to itself. In the formal style of gardening which prevails, not inappropriately in the vicinity of the Monumental Palm-house, these beds have an excellent effect, and enable the visitor to note the general character of the plants to advantage.

— JAPANESE MAPLES.—A slope of the Combe

slight precaution, and that when ripe the Plums are very juicy, with a pleasant brisk flavour which should render it acceptable, especially for cooking purposes. It is rarely that we get such a combination of good qualities in a single tree.

— WHY IS IT SO?—Here is a curious fact for those interested in the peculiarities of plants. Here are two yellow-flowered annual German Stocks; one is called sulphur-yellow, the other canary-yellow. In

FIG. 62.—OLEARIA (EURYBIA) MACRODONTA: HARDY SHRUB: FLOWERS WHITE. (SEE P. 304.)

planted out in a bed in the vestibule to the Nymphae-house, the lovely dark purplish-blue flowers, which were fairly numerous, measured 3 inches in diameter, and the foliage was correspondingly robust. *Sesbania aculeata* is remarkable for the white corky development of the roots, which must enable them to float the more readily on the surface. Whether or no, the larger roots float on the surface, and give off very regularly at right angles a dense mass of smaller fibrils. We have already had occasion to notice the flower-beds, but we may add to the record a note of those surrounding the Palm-house, where, backed up by the Yew hedge, are

Wood Nurseries affords now a beautiful spectacle in the shape of a plantation of these shrubs, as remarkable for the elegance as for the brilliant colouring of their foliage. *Acer japonicum* var. *sanguineum* is particularly brilliant just now. Has any one tried grafting these as standards? They would form a splendid contrast to the *A. Negundo* variegatum.

— PRUNUS PISSARDI.—We have received from Mr. FOSTER, of the Stanmore Nurseries, further specimens of the fruit of this tree, to show the profusion with which it is produced, and its handsome appearance. We may add that it travels well with

general characteristics these two greatly resemble each other, and there is not much difference in the colour of the flowers; one is a shade—only a shade—darker than the other; but the single flowers of the first are uniformly of the same colour as the double flowers, but in the case of the latter they are always pure white, and these white flowers do not produce white-flowered double Stocks, but canary-coloured ones, except such as are single, and these are white.

— SMITH'S EPICUREAN PEA.—This variety, according to the account sent to us by the raiser, has the property of bearing twice in the season, more or

less according to the weather. The first crop, in the case of the sample sent to us, was plucked about the middle of the month of July; the second crop comes, if the weather be favourable, in the form of a bunch or cluster of pods close to the ground. We must suppose by favourable weather is meant one liberable moisture with much heat; for unless these conditions are present the second crop may be looked for in vain. The raiser states that at the best the second crop produces only short pods, but these fill well if the weather be sunny. The seeds are wrinkled, large, and of a fairly sweet taste; and the haulm reaches the height of 3 feet.

— **JAPANESE BERBERIS.**—At Combe Wood may be seen just now specimens of Berberis received from Japan, and quite like our European *B. vulgaris*, but with rather larger berries, a little broader at the free end. The distinctions are not sufficient to constitute a species, and it is interesting to see how very widely the common Berberis is spread over the world. How or why is this? A nice question for geologists, geographers, physiologists, and botanists.

— **ROYAL NORTHERN HORTICULTURAL SOCIETY OF ABERDEEN.**—The autumn exhibition of this Society will be held in the Music Hall Buildings, Aberdeen, on Friday and Saturday, September 10 and 11. There are 105 classes, with three awards in each, making 500 prizes for competition. These classes are divided into four divisions—professional gardeners, nurserymen, amateurs, and working-classes. The exhibits will comprise four varieties, namely, pot plants, cut flowers, fruit, and vegetables. The opening ceremony will take place on Friday at noon, when Lord Provost MATTHEWS will preside. Entries close on September 6. Notwithstanding the backward state of the season it is fully expected there will be a large number of exhibits.

— **BANANAS HARDY IN SURREY!**—If any one should doubt the fact let him betake himself to Combe Wood, and there he will find a Japanese form, introduced by MARIES, which has stood out two or three winters.

— **CARPENTERIA CALIFORNICA** is now in bloom against a wall at Kew. Though so like a *Philadelphus* in flower, the leaves are more like those of *Forsythia*.

— **THE GUERNSEY AND JERSEY FRUIT AND PRODUCE COMPANY, LIMITED.**—The above company has recently brought out its prospectus together with the first issue of its shares. The company, which was established in February last, has now about 50,000 square feet of glass, and further buildings are rapidly being proceeded with. As nearly the whole of the company's capital is being invested in valuable freehold land in Guernsey, the property will increase in value with the growth of the vines and lapse of time. It is worthy of mention, that two other local companies have paid their shareholders annual dividends of from 12 to 20 per cent., and it may be mentioned that from one house alone the returns for a week amounted to over a quarter of a ton of Tomatos, the good quality of which at the present time we can guarantee from observation.

— **THE MARKET GARDENERS', NURSERYMEN'S, AND FARMERS' ASSOCIATION** held their annual dinner at the Holborn Restaurant, on Thursday, August 26, Mr. W. FOUFART, President of the Association, presiding. Mr. W. FOUFART proposed the toast of the evening, viz., "The Market Gardeners', Nurserymen's, and Farmers' Association," an Association formed in the year 1828 by a few of the growers attending the London markets, with the object of promoting the interests of its members. The President drew attention to the numerous benefits the trade had from time to time derived from the Association, and to the necessity there is in the present state of depression and competition that the Association should be well supported, in order to be ready at all times to protect the trade.

— **CVCLAMEN REFANDOM.**—A little patch of these is now in bloom amid the turf on the mound near No. 1 Museum at Kew, where experiments have been made for the last few years for the purpose of establishing various plants in the turf. We cannot say that so far the experiment has been successful, as a patchy appearance results. This probably arises from

the right plants not having yet been found. No doubt the idea is a good one, but its successful realisation has yet to be arrived at.

— **SALE OF CARSE OF GOWRIE ORCHARD FRUIT.**—The annual sale of the fruit in the famed Carse of Gowrie orchards took place in the hotel at Errol on August 21. There was a large attendance, but owing to the fruit crop being almost a failure, and the plentiful supply of foreign produce, the bidding was spiritless. The following are the rents for seasons 1885 and 1886:—Seggindie, 1885, £250; 1886, £200; Port Allen, 1885, £44—1886, £12; Ssasse, 1885, £81—1886, not sold; Bodmin, 1885, £14—1886, £7; Powgowie, 1885, £5—1886, £5; Hlane, 1885, £10—1886, £5; Inchyra Manor, 1885, £25—1886, £7; Gairdiehill, 1886, £100; Metginch, 1885, £40—1886, £12 10s.; Bomersund, 1825, £20—1886, £4 10s.; Carse Grange, 1885, £7 10s.; Newbig, £2; Mairhouses, 1885, £8—1886, £7 10s.; Berrath, 1885, £6—1886, £4. It is said to see a fine orchard, such as Gairdiehill, containing over 40 acres of fruit trees in bearing condition, let for such a small sum. It has been known to realise £1400 in one season before foreign competition became so keen, and often ran as high as £300 to £1000; but, alas! times are changed. *Dundee Advertiser.*

— **A WILD WHITE POPPY!**—A correspondent obligingly sends us a specimen of a white form of *Papaver Rhoeas* growing with the scarlet ones amid the corn in Yorkshire. The flowers are very pretty—white with a purple eye.

— **BUDDEIA GLOBOSA IN FRUIT.**—At that repository for all that is interesting in the way of hardy shrubs, Combe Wood, we lately found a specimen of this old-fashioned shrub bearing closely set capsules in globular heads, resembling an old mace. We do not remember to have seen it before. We are glad to see that this singular shrub is not lost to the country after the severe winters at the beginning of this decade.

— **A MONSTROUS CUCUMBER.**—A curious example of abnormal growth in a Cucumber was brought to us by Mr. SIM. JACOBS, of Covent Garden. The fruit had three coils, and measured 4 feet 10 inches from stalk to tip. It was otherwise, apparently, of good quality, and was slightly thickened at the apex. Probably the coiling was due to some impediment to its onward growth, but that would not account for the enormous length of the fruit.

— **FUNERAL OF THE LATE MR. ROBERT LORD.**—This took place on August 21, in the Unitarian Burial Ground, Todmorden, in the presence of a large gathering of people. The procession left Ilolebottom shortly before 3 o'clock, headed by the Rev. A. E. CAMM, minister, and the warden and organist of the Unitarian Church, where the deceased had been choir-master for a term of thirty-three years. The members of the church committee followed, then the members of the choir, and alongside the hearse a deputation from the Todmorden Musical Society. Following the family and relatives of the deceased came a number of florists, gardeners, &c. Wreaths were sent by the Unitarian Church choir, the musical society, and by several friends, whilst members of the family supplied two of exceptional beauty—one of Carnation and another of Proteas, for the raising and culture of which the deceased had attained very wide celebrity. Memorial services were held on the following Sunday, and the wreaths which had been laid on the coffin at the funeral, were placed on the communion-table of the Unitarian Church.

— **EUCALYPTUS COCCIFERA.**—This tree, of which we gave an illustration from the fine specimen at Powderham Castle some time since, is hardy at Combe Wood. The thin bark is as white as the most silvery of Birches.

— **PUBLICATIONS RECEIVED.**—*Proceedings of the Sixth Meeting of the Society for the Promotion of Agricultural Science, held at Amesbury, Wiltshire.*—*Report of the Forest Department, Madras, 1884-85.*—*Albums for the Athlon (with Supplement).*—I. WRIGHT, F.R.H.S. 171, Fleet Street, E.C.

— **GARDENING APPOINTMENTS.**—MR. ARTHUR HORSSELL, for the last four years Head Gardener at Worsley Park, Guildford, has been appointed Gardener to Lord BATEMAN, Shobdon Court, Herefordshire.

HOME CORRESPONDENCE.

What to do with our Gardeners.—The suggestion that we should utilise our surplus gardeners as teachers to the young of gardening is an admirable one so far as it goes, but something more than a mere plot of land would be needed to enable any one teacher to find ample opportunity for the display of his abilities and filling up of his time profitably. The difficulty lies, not in the supply of teachers of gardening, which are plentiful enough, but rather in obtaining the land and finding the means. We have no authority in the kingdom possessing power to provide land, implements, or teachers for gardening instruction, and, I fear, if the teachers wait until the former are provided, not a few will starve. The surplusage of labour seen in gardening is duplicated in every direction, and the problem cannot be solved by deporting a number of the extra or non-employed to other lands. Probably there has always been a surplus of gardeners over seeing gardening, being a profession or occupation. The non-employed may now make their wants known cheaply, through the instrumentality of the papers, and for that reason, perhaps, it is thought that we have far too many. We have no reliable statistics of the number of persons employed in this country in gardening, but were such given very probably it would be found that the proportion of unemployed gardeners was remarkably small as compared with the state of things found in other vocations. The proposal to find work for surplus gardeners in teaching the young the elements of gardening is far wiser than is the counter-proposition made in some other quarters, that we should limit the supply. As long as the population increases, some form of labour or industrial training must be found for the newcomers, and if limitations take place in one direction, an overwhelming surplusage of labourers will be created in another. Thus it is evident that the only real cure for an admitted evil is to be found in providing fields of labour in some form or another. We heard at Liverpool of plants being grown on shipboard, but ships' gardeners would be esteemed as great curiosities as ships' gamekeepers, and yet we coöperate of a time—for all things tend towards luxury, if not to sybaritism, on board our great passenger steamers—when plant decoration shall form part of the ordinary routine of the service, and ships' gardeners become realities. No doubt were such novel forms of luxury to break out there would be found plenty of candidates for the posts, willing to brave the terrors of the sea to secure so quiet and yet not unpleasant a livelihood. To return to matters more terrestrial, there is a capital opening for gardeners in the direction of garden officers to communities, not, of course, on a socialistic basis, but upon the practical one that each rural community or parish should have power given it to acquire land, to be let out as allotments to the working classes, with the professional gardener as teacher to the allotment holders. With a couple of acres set apart for the children, this area of land could be worked to some extent profitably by the children whom the allotment garden head should also teach, and the produce disposed of to the best advantage in the community. Such a plan may be adopted without difficulty. *A. D.*

Chrysanthemum uliginosum.—In your remarks at p. 274 acent the above, you refer to the confusion existing in gardens respecting the true plant. That I am confused I am willing to admit, and as at present I see no way to clear up the matter, I shall be glad to receive assistance in the matter. As the night is, since I sent you for naming what I then regarded as either a distinct species, or at least a well marked form of *Chrysanthemum leucanthemum*. This you decided to be *C. uliginosum*, and at the time this gave me every satisfaction as to its accuracy; but judge of my disappointment at seeing quite a different plant figured in your last issue under the above name. The specimen which I sent you, and to which I refer, is distinct from the one figured at p. 205 as *C. uliginosum* in these particulars—1, there is only one row of ray florets; 2, the ray florets are distinctly linear; 3, the florets are reflexed, as in *C. maximum*, at maturity; 4, it flowers fully three weeks earlier than *C. maximum*, while you speak of it as flowering later. I regret having no material to send you now, as the plants have done flowering fully a fortnight since, and are now cut down. If the following description will be of help, however, I shall be glad—*Maximum* height, 3 feet 6 inches, and needs slight support; flower-stems forked; flowers about 3 inches across, rays linear and reflexed; leaves very deeply and sharply toothed, 6 or 7 inches long, lanceolate acuminate, and deep green in colour; radical growths numerous, as in our native *Chrysanthemum leucanthemum*; was at its best about the middle of July. It is possible that the above plant is confounded with *Pyrethrum uliginosum*, which grows 6 feet high or more, and produces its flowers in

clusters during September and October? In some hardy plant lists *Chrysanthemum serotinum* is given as a synonym for the last named plant, while in other lists the generic names are reversed, and are to be read as *Chrysanthemum uliginosum*, syn. *Pyrethrum serotinum*. In Loudon's *Hortus Britannicus* *Pyrethrum serotinum* is cited as a perennial growing 4 foot high, and a native of North America, while *P. uliginosum* is an evergreen (3) herbaceous perennial, 13 foot high, as coming from Hungary in 1816, and figured in the *Bot. Mag.*, 2706. It is evident there is confusion somewhere, as the plant now grown and universally recognised in gardens as *P. uliginosum* does not agree with the particulars here given, and which forms one of the stateliest of autumn flowering perennials. *E. Jenkins*. [Fig. 51, in the last number, represents *Chrysanthemum uliginosum*, or *Pyrethrum*. *Pyrethrum* being now reduced to a section of *Chrysanthemum*. It is the same as *P. serotinum*. Fig. 55 is *C. maximum*, the leaf to the left in outline we omitted to say was that of *P. latifolium* syn. *laeustre*, inserted for comparison; *C. maximum* and *C. uliginosum* have much thicker and more succulent leaves than *C. uliginosum*. Ed.]

Run-out Potatoes.—The characteristic shown by the seedlings from *Solanum Maglia*, as mentioned at p. 240, of sending out tubers on long stolons, and of throwing up lateral growth in the form of suckers, is also common to first-year seedling Potatoes, as all who have embarked in Potato raising can attest. All such kinds have by me been invariably rejected as having objectionable features which may be more or less perpetuated. Some seedlings from American Purple X Przetaker give rank-growing tops with these running-out characteristics strongly developed; indeed there is occasionally seen in seedling Potatoes from certain crosses such a tendency to hark back to a semi-wild form, that in such cases perhaps as matter of fact the plants are as early as they are promising. Assuming that anything in the direction of procuring hybrids which would withstand or be impervious to the Potato disease may result from the fresh start just made with old progenitors, very much additional interest is given to the effort by reason of the somewhat fierce visitation of *Peronospora* which during the past week has enveloped our Potato tops. This visitation is a month later than in most previous years, but it threatens to be very violent in its effects, as the tops are spotted extensively as to render the total disappearance of the foliage in a week or two a matter of exceeding probability. As far as the tubers are concerned, little complaint has been made, the soil generally being so very dry. Moist foggy nights serve to propagate the spread of the fungus rapidly. Probably it will be well that Mr. Jensen's advice, not to dig up crops whilst the foliage is full of spores, and the air charged with them, should be remembered and acted upon [and somehow as perfectly as possible, to destroy the haulm]. *A. D.*

Tuberous Begonias.—Their utility for the purpose of bedding-out is well illustrated by some charming clumps planted out in the neat little rockery at Chiswick. Nestling amongst the "stoves," a very pretty and graceful effect is produced; giving, too, a glare of colour that is most acceptable, the absence of which at times is very noticeable in such situations. *B.*

Fire-blight.—In the *Gardeners' Chronicle* for July 31, among the answers to correspondents, I find that Mr. Alfred Edwards has called attention to Pear shoots which are said to have been killed by the sun shining upon them while wet. If it is convenient to forward me some small samples of such specimens which I can use for microscopic examination, I shall be greatly obliged for them. This would be the way in which a slight attack of fire-blight would be most likely to be observed and accounted for; and my object in asking for specimens is to determine, if possible, if this may not be a case of real fire-blight. It has occurred to me that while there is no record of this disease in Europe, it still may occur to some slight extent without being recognised. I imagine that the interior of Russia gives a climate that more favours its development than any other portion of Europe, but I have no means of learning about the diseases of fruit trees in that remote part of the world. *The Irish Agricultural Experiment Station*. [We insert this letter, as we have no present means of communicating with our correspondent. Ed.]

Protective Resemblance amongst Antiquities.—I have several times shown in the *Gardeners' Chronicle* how an accidental resemblance of a useless relic to a useful object has been the means of its careful preservation. The same idea is very familiar amongst animals and plants, but less commonly noticed (although equally potential) amongst old stones. During last week's meeting of the Cambrian Archaeological Association in Glamorgan-shire a so-called "stone pilory" was visited close to Llanrhidian Church. It is difficult to conceive of a "stone pilory," but the mystery vanished when the

object was seen. The "pilory" was no other than a very ancient wheel cross (familarly known as an Irish cross—more common in Irish churchyards than in English), with the upper part broken off. A wheel cross is like a common gravestone with a broad-shouldered cross at the top, the arms connected by a stone circle, like a cart wheel with four broad flat spokes, the spaces between the spokes being circular or rarely triangular holes. The two upper holes had vanished with the top of the Llanrhidian cross, the two lower had been utilised as holes through which drunkards' hands could be thrust previous to their being tied in position with rope. The whole relic would long ago have been destroyed had it not, when broken, borne an accidental resemblance to a "stone pilory" with two hand-holes. The piscina is sometimes preserved as a hard and latter cooler, font-bowls are often preserved as troughs for pigs, altar-slabs for door steps, early Christian memorial stones for gate posts, and for "rubbing stones," i.e., stones against which pigs and oxen may in the field rub their itching skins. *H. G. S.*

Abies Lowiana (Parsonsiana).—After reading your papers I incline to the belief that there is one polymorphous species, viz., *A. grandis*, typical, a coast plant; *A. grandis* var. *Lowiana*, California; *A. grandis* var. *concolor*, Rocky Mountains and Utah; or for garden purposes, *A. grandis*, coast; *A. Lowiana*, California; *A. Lowiana* var. *concolor*, Colorado. The point being that the Californian plant (*Lowiana*) should go with the Rocky Mountain form (*concolor*) rather than with the coast form. *A. grandis* var. *Lowiana*, was first proposed by Hoopes in his *Book of Evergreens*, p. 212. As for the *Abies* magnifica question I wait more light before being able to consider the two as belonging to one species. *C. S. Sargent, Arnold Arboretum.*

High Temperature.—We are having very warm weather here for the end of August. On the 30th the maximum temperature in a Stevenson screen was 84°, and that has only been reached twice before this season, viz., July 3 and 4. The minimum on grass on August 30 was 43° and in the screen 45°, giving a rise of 39° in one day. Tuesday, August 31, the readings have been as follows:—Minimum on grass, 51°; minimum in screen, 55°; maximum in screen, 85°. *W. H. Divers, Kelton Hall, Stamford.*

Double White Lily.—Your inference is correct, regarding it being the single form turned double. As the double variety has never been grown here by my knowledge, my own opinion is that the late spring frosts have affected the young growths of the Liliums and perhaps a want of ripeness or maturity in the bulbs through the bad seasons we have had lately. But I shall be glad to hear if any of your correspondents have had a like experience, and to what they may attribute the cause, as my surmises may not be correct. I wish to say that our garden is very low, somewhat to the back of the sun. *Gardener's Share.*

New Names and Old Things.—If Mr. Serpell's suggestion is to be carried out practically the Council of the Royal Horticultural Society must obtain legal powers to prosecute in every case in which it is found that, having decided which is the correct name of any plant, fruit, or vegetable, that name is set aside and another one adopted. There is not the least probability that such power would be granted, or even if it were, that it would or could be enforced? The public have good cause for complaint if in purchasing some old thing under a new name they find themselves deceived. They can publicly expose the deceit or refrain longer from patronising the offenders. There is no doubt whatever that much of this renaming of things is done in ignorance, but where done openly and wilfully it merits the strongest censure. The proposal to disqualify all exhibits incorrectly named is a very drastic one, and assumes infallibility on the part of the judges. In such cases corrections are made, but under whatsoever appellation things may be shown at least names give no factitious value to them. A good thing will remain good whether called the Beauty or designated as the Beast, whilst withholding prizes for what judges held to be incorrect nomenclature would lead to endless disturbances. Still further it would be most unfair were the innocent and ignorant exhibitor made to suffer for the evil doings of the seedman or florist from whom he purchased his stocks. The evil is not a terrible one, though it is an exceedingly annoying one very often. Probably it will right itself in time, but it may often be inappropriate to make a biblical quotation, and invite "he that is without sin amongst you to cast the first stone." *A. D.*

Two Pretty Flower Beds.—It is a trite complaint that some of the prettiest annuals are not half made enough of. The ordinary flower bed of *Pelargoniums*, *Calceolarias*, and *Lobelias* seems to have got such a hold on the popular fancy that to assail its position appears as hopeless as it did ten years ago.

No one wishes to see such beds disappear, but every one who really has an *extente cordale* with Nature must wish for some variety—for something less formal and which is at the same time bright with colour. Two such quietly pleasing beds I think I can suggest. The first consists of the Swan River Daisy (*Brachycome (identical) and Heliotropium*). The second of *Agathea amelloides* and *Verbena Melanodes*. The first mentioned is now a great feature in the Tresco Abbey gardens. The *Brachycome* affords bright colour, and is a flower whose loveliness never palls, while the *Heliotropium* charges the vicinage with its fragrance, and whose foliage sets off the purple, mauve, and white blossoms of its neighbour. The *Brachycome* again, if lifted from the border, and then potted and put in the greenhouse, will continue to produce its loose terminal corymbs of *Cineraria*-like blossoms till November. *Lagdon.*

"Agaricus personatus Dangerous."—Under the above heading, in the *Gardeners' Chronicle* for December 4, 1875, p. 720, I called attention to the occasionally dangerous character of the above common well known and so-called edible Agaric. The species is largely eaten by some rustics, and it is sometimes sold in the markets under the name of "Blewitts" or "blue hats." On December 11, 1875, the Rev. M. J. Berkeley corroborated my remarks, and recorded an instance of fatal consequences resulting from the potted and eaten of this species. In the *Daily News* for August 25 last a report is given of the case of a man and his daughter who were both killed by eating fungi locally known as "blue buttons," and no doubt *Agaricus personatus*. I have other records of the same nature. *H. G. S.*

Pea Telephone.—While confirming all Mr. Keely (p. 182) says respecting the heavy cropping qualities and excellent flavour of Prodigy Pea, I do not think many will verify his remarks as to its being as early as William I. Indeed, I do not know of a large podded Pea of the Prodigy type, more particularly a wrinkled Marrow, that will keep the seed with William I. in the spring months, which in the 1885 Chiswick report of the new Pea, Prodigy is described as "a very good mid-season Marrow." I would caution all who wish to economise their valuable seed of this variety not to be too lavish in sowing it as a companion to William I., or any other early round seeded variety, as wrinkled Peas are very apt to decay in the soil when sown very early. As to this kind eclipsing Telephone, I do not apprehend that this will happen, as Telephone has now become established as a leading main crop variety, being free and robust in growth, wonderfully prolific, excellent in flavour, and not in any way meriting the bad character given it by Mr. Rust, at p. 215. I have grown it every year since its first introduction, as well as seeing it in many gardens throughout the country, and I have never noticed it exhibit the slightest disposition to produce shrivelled blossoms or abortive pods, and its behaviour with the rust is so very exceptional that I feel sure the cause must rest in the method of culture, as it is certainly not constitutional. Indeed, I have had a little experience of the same kind this season. Last April, Mr. Laxton sent me two of his new Peas to try; the drill which was opened for them was a lengthy one, and there was not enough of seed of the two to sow it from end to end, and the deficiency was made up by sowing a handful or two of Telegraph at one end. The new ones were a success, but for some cause the piece of Telegraph was almost a failure, the pods being few and small, and vastly inferior to what they were in other parts of the garden. This, however, did not lead me to the conclusion that it was a bad Pea and much inferior to some of the old sorts. On the contrary, I have had almost uninterupted proof that as a round main crop Pea it is possessed of the highest merits. *Fas. Nuir, Margan Park, South Wales.*

— I see in your journal [of August 21 some remarks from your correspondent, W. H. D., upon the Pea Telephone. In these remarks your correspondent says the large-podded varieties have not done so well with him as have the smaller-podded varieties. With my experience I am unable to see why the large-podded varieties should suffer from mildew, and the small-podded varieties not suffer in the same way. Perhaps your able correspondent, "W. H. D.," will kindly give me and other readers of the *Gardeners' Chronicle* his opinion as to the cause of the large varieties, such as Telephone, becoming mildewed, and the small-podded ones not being so affected. With me this year, up to the present date (August 21) I have not detected the least sign of mildew in my garden, and I have Peas in all their different stages. I would just say that I have grown this year about twenty varieties, and I must say from this and past experience that I cannot give preference to small-podded varieties, when we have such Peas as Telephone, Stratagem, Pride of the Market, Telegraph, Duke of Albany, Evolution, Waltham Hero, Mr. Laxton's No. 6, the name of which I have forgotten, but it is about the same in

quality, colour, and shape, as Duke of Albany, and a very large cropper. The Peas I have named are all good croppers, good for exhibition and for culinary purposes, and, with about two exceptions, very sweet-tasted Peas. If I were asked to name four of the largest and best-podded Peas, taking all points into consideration, I should name Telephone, Duke of Albany, Stratagem, and Mr. Laxton's No. 6, and were I asked to name one of the above four, I should certainly say Telephone. *Henry Marriott, Prospect House, Skirbeck.*

Figs from Seed.—I have read the articles in the back numbers of the *Gardeners' Chronicle*, mentioned last week in the editor's note under this head, I tried in the autumn of the same year—1883—to raise Fig trees from English seed. Accordingly twenty ripe Figs—the White Marseilles—grown under glass, were picked and placed on a slate to dry in one of the hot-houses. When the pulpy part of the fruit had become moderately dry, some fine dry sand was mixed with the remain, and the whole was put in a saucer and kept in a dry place until early in the following year, when the mixture of seed and sand was sown in a couple of seed pans, which were placed in gentle heat, watered, and attended to. In a short time after sowing, five or six seedling Figs made their appearance in one of the pans (none came up in the second pan); these, with the exception of one plant, were very weak specimens, which, after lingering for a time, died off, leaving only one plant. This continued to thrive, and could easily have been grown on, had it not been discarded. Considering the number of seeds sown in this experiment, the percentage of seedlings was very poor. However, with all due respect to the remarks of the *Gardeners' Chronicle*, I quite satisfied myself that Fig trees could be raised from English grown seed. Stray seedling Fig trees are by no means very uncommon in gardens, and would, I rather think, be more common were it not for the hoe. I have occasionally seen one in near proximity to old trees, which may or may not have sprung from English seed. Referring to my note respecting the appearance of seedling Figs (examples of which I forwarded you) after an application of dry earth-closet manure to the surface of an inside Vine border, I may be allowed to mention here that seedling Figs came up as freely as Mustard seedlings, not only the first season after the application of the dry earth-manure, but also in the second year. Moreover, last autumn the surface soil of this Vine border was taken off, and some of it was used in the compost for early Carrots grown in a pit here; during the season several seedling Figs have grown amongst the Carrots, also in pots, in which a mixture of the Vine border soil was used. I am not at all prepared to say that these seedling Figs were from English seeds, but owing to the very limited quantity of foreign or dried shop Figs that I know to have been consumed in my house during the accumulation of the manure, they would hardly account for the very great number of seedlings that have appeared first and last. If these seedlings were all from the foreign source, then vitality in every seed in every Fig must have been perfect. H.

I have now testimony that the seedling Figs mentioned in a previous letter were actually derived from home-grown fruit. One of the members of my family, without any suggestion on my part, distinctly remembers repeatedly having gathered Figs from the large tree in my garden, to have eaten the fruit, and to have cast the skins away at the spot where the seedlings were afterwards found. No imported Figs were ever to our knowledge treated in like manner. I can have no doubt that the seedlings originated as is here stated. H. E.

Cypripedium Vagaries.—In our last issue we gave a figure of a remarkable peloria of *Selenipedium caudatum*, and this week we publish three other figures which are of much botanical interest as explanatory of the curious structure of Orchid flowers. Most Orchids have but one stamen, called for convenience sake, A 1. Cypripediums generally have one stamen imperfect and barren (A 1), and two lateral fertile (a 1, a 2). Theoretically and, actually by exception, there may be three outer stamens (A 1, A 2, A 3), and three inner (a 1, a 2, a 3). The presence of all six is very unusual, but many flowers, like some now figured, show some of the ordinarily missing stamens. In a flower of *C. barbatum* which we have lately had an opportunity of examining (fig. 63), there were two lateral sepals s, s, bent downwards, a single petal, p, placed above and in the centre, in the position usually occupied by the dorsal sepal, opposite to this was the lip, L. The column bore one stamen only, A 1, the one present in most Orchids, but usually absent in *Cypripedium*, while the two, a 1, a 2, commonly present in this genus were absent.

In *Cypripedium Lawrenceanum*—for the flower of which (fig. 64), representing the details, we are obliged to Mr. Henry Stevens—it will be seen that the sepals are placed laterally, and that of the two petals one is placed above in the position

usually occupied by the upper sepal, while the other is represented by the lip, so that the perianth is in two rows, placed crosswise. The column, in this case, bore three stamens, A 1, opposite the lip, being the stamen

two lateral staminodes a 1, a 2, and indications of the lip, L, L; C is the column from the back, D is the column from the side, showing the perfect stamen A 1, the stigma in front of it, and at the side the scar whence a 2 has been removed. Fig. 65 shows a diagrammatic view of a flower of the same species received from Mr. James, of Norwood. In this case the flower was of the normal character, except as to the column, which bore the usual staminode, representing A 1, of the outer row of stamens. a 1, a 2, were fertile and in their usual position, while a 3, which is generally absent, was in this case represented by a second lip, enclosed within the ordinary lip, l, so that the flower had two lips, one enclosed within the other, the secondary lip being really the metamorphosed stamen, a 3.

FIG. 63.—*SELENIPEDIUM BARBATUM*, DISTORTED FLOWER, WITH ONE STAMEN ONLY. (SEE TEXT.)

FIG. 64.—FLOWER OF *CYPRIPEDIUM LAWRENCEANUM*, WITH DISTORTED PERIANTH AND THREE STAMENS, ONE OUTER FERTILE, TWO LATERAL BARREN.

that is present in most Orchids, but generally wanting in *Cypripedium*; and two lateral stamens at a 1, a 2, represented by barren shield-like staminodes. In the figure 64, A represents the entire flower seen from the front; B shows the column from the front with the

Epipactis latifolia.—Long ago I had found out that the Bird's-nest Orchid, *Neottia nidus-avis*, and probably also *Ophrys apifera*, increase beneath ground to flower above, but never till to-day was I made aware of the fact, although for years I have entertained the idea, that *Epipactis latifolia* behaves in a similar manner. On examining a particular part of a woodland where last summer beds of this Orchid grew I was quite taken aback to find that this season there is not even a solitary specimen. Puzzled to account for this total disappearance, and knowing the exact spot where a cluster of unusually large specimens grew last year, I determined to search there out and find whether the plants had died out after flowering or were cumulative beneath ground. With but little trouble I found the very withered stems that last season I had seen in the full vigour of life, and on carefully removing the soil at their base found that the roots were not dead, but fresh and healthy, and with eyes or buds attached to each. Not content with these instances I hunted out other plants, which was easily enough done from their withered stems, and in all cases found the new eye or bud perfectly formed, but too small in size to be able to produce spikes of equal size to the parent plants, and which I knew from the numerous roots of all sized specimens that I have on various occasions examined. Now, as it is rarely that one sees flowerless plants of this Orchid, it must be, judging from the above remarks, that the bud increases beneath ground until of a flowering size, when it springs up, flowers, and is not again seen until a flowering bud is developed. How long this takes I cannot say, but the time will now, by patient waiting, be easily enough found out. If any one already knows, please say. A. D. Webster.

Arundinaria khasiana.—Some eight or nine years ago all the specimens of *Arundinaria falcata* or *Thamnochlamys Falconeri* simultaneously flowered from every joint or node of the stems instead of producing leaves as they had hitherto done, they then produced a quantity of seed much resembling Oats, then all died. This summer the *Arundinaria khasiana* are all similarly covered with blossom instead of foliage, although they have for some weeks been so, and a large quantity of pollen flying off them when touched, I can as yet see or feel no signs of seed setting in the bracts. W. E. Cumbleton.

Eichornia azurea.—The illustration and account of this plant as grown in the Oxford Botanic Garden, and published in the *Gardeners' Chronicle* on January 2 last, having been seen by Mr. F. O. Vincent, of the conservatory, Golden Gate Park, San Francisco, California, he made application to me for seeds of it, expressing his desire to cultivate the plant in the conservatory under his care. We had no seed of it at the time the application was received, but early in May some flowers were fertilised with their own pollen, and as soon as ripe seeds were produced they were sent to him (June 30), and he, acknowledging their receipt, says:—"I planted them at once. . . . They germinated freely within five days, and they are doing very well." The water in this tank stands at 75° to 78°, and the pot in which the seeds were sown was plunged 1 inch under the surface. W. H. Baxter.

Hollyhocks.—If evidence were wanting as to the possibility of growing good Hollyhocks without injury from the fungus pest, it is afforded at the Messrs. Sutton & Sons' Leading Nursery, where seedling plants are not only clean and healthy, but blooming finely; they suffer from but one drawback. At this time of the year the flower shows held within 20 miles or so of Reading are so numerous that they seem to fall in somewhere every day, and sometimes two on the same day. At very many of these shows it is the practice of the great seed firm to send big collections of flowers of many kinds, and because of this the Hollyhock spikes have their blooms greatly thinned. Still, enough are left to show colour and quality, and as representing seed stocks both are excellent—colour in respect of the fact that like seems to reproduce like with considerable faithfulness; and

quality is shown in the fact, that many of the flowers are as good as were those of old named varieties. It is very satisfactory to know that we have such good seed strains, and need not be in any concern lest this fine old garden flower should pass out of existence. At Reading, it would be easy to note over a dozen diverse colours, from white to heavy maroon in selfs, and others which have either flushed or tinted petals, or have deep hued bases. Planted in rows 3 feet apart, ample space is given to inspect the merits of each one, but in ordinary culture or in masses less space will suffice. One important thing in relation to Hollyhocks from seed is to treat them as biennials, sowing seed in May to ensure thoroughly robust plants to put out in the autumn, and bloom the following year, always planting yearly in fresh ground, thus appreciably baffling the fungus. A second sowing made in July will give plants to bloom towards the autumn in succession, but for seed-saving purposes the early sowing should be relied upon. These late bloomers if cut much after the flowers are past will give fine plants to bloom the succeeding year, often sending up three or four strong stems, covered with bloom. If the foliage has remained clear the first year, transplanting is not essential, but the cultivator must be guided by that consideration. Top-dressings of manure and plenty of water are valuable aids to the production of fine spikes and blooms. The former may well have the points taken out when a fair height has been reached, and the latter will often be the better if thinned on the spike, as undue crowding often ensues. As seed stocks give defined colours, and packets of such colours may be obtained, a grand effect is produced when a dozen plants of any one colour are grouped together. A. D.

we have ever seen them shown in London, from Mrs. Robin, secured the 1st prize in that class.

Begonias are much better seen about London. Coleuses were well shown. Orchids were but poorly represented, as were also the classes for newly introduced plants.

Cut flowers were fairly well displayed, Roses,

were a good class, Fruits jaunes being apparently a favourite variety.

The Apples and Pears call for no special remarks the season being yet too early to judge of them. Great credit is due to the Hon. Secretary, Colonel Howell, for the excellent arrangements made in the management of the exhibition, and our thanks to our representative are due to him for his courtesy and urbanity to our representative.

SHROPSHIRE HORTICULTURAL :
August 18 and 19.

This Society has during the last eight or ten years gained the reputation of being one of the most flourishing and best managed in the provinces. The Quarry, where the show was held, is ten or fifteen minutes' walk from the station, but the committee of the above Society and its indefatigable Hon. Secs. (Messrs. Adnitt and Naunton), finding that something besides an exhibition of plants, fruits, flowers, and vegetables was necessary to insure a successful meeting, provided an attractive programme, including amusements, which were found in a part of the grounds specially set apart for this purpose, the large marquees containing the horticultural productions being pitched in another part, but having no barrier other than a row of shady trees. Hence it was that about 60,000 people paid for admission to the Quarry grounds. Plants were shown well by Mr. James Cypher, of Cheltenham; Mr. C. Roberts, Highfield Hall; and Messrs. Pritchard & Sons, Frankwell Nurseries, Shrewsbury; and fruit was well represented by contributions from Gunnersbury, Longleat, Ingestrie, Elvaston Castle; and from G. Barker, gr. to Mr. Alderman Baynes, Birkenhead.

PLANTS.

For twenty stove and greenhouse plants, not less than ten in flower, the handsome prizes of £25, £20, and £15, respectively were offered, and brought out a good competition—the 1st prize, as is usual, going to Mr. James Cypher, for a collection of well grown, but smaller plants than those which he has recently shown, all being well coloured, and capitally bloomed. Mr. C. Roberts, gr. to A. Nicholson, Esq., Highfield Hall, was 2d, who staged a very good even lot of plants. Mr. Cypher securing the 3d award, exhibitors being permitted to take more than one prize in each class.

Mr. C. Rolfe, gr. to H. Lovatt, Esq., Low Hill, Wolverhampton, was 1st for nine stove and greenhouse plants, showing a good lot; 2d, Messrs. Pritchard & Sons; and Mr. Juson, Abbey Forgeate, 3d.

Mr. C. Roberts was 1st for six stove and greenhouse plants, in or out of flower, as he also was for a like number of similar plants (Orchids excluded), showing well in both classes.

Groups arranged for effect made a telling display in the plant tent, and we noticed that there was a departure from the usual arrangement of such in the undulated, sloping bank, consisting of Maidechair Feros, Palms, Crotons, Dracaenas, &c., with spikes of *Odonoglossum Alexandrie* showing above the general level. The 1st prize was deservedly awarded to Messrs. Pritchard & Sons, Messrs. Jones & Sons, being 2d, with a tastefully arranged group.

Ferns were shown well, the plants, though small, being fresh and well grown. For six varieties, Mr. Lambert, gr. to Colonel Wingfield, Oslow, was 1st; Mr. Cypher 2d, and Messrs. Pritchard & Sons, 3d all three showing well.

Several collections of four Fuchsias were shown, the 1st and 2d prizes going to Messrs. Pritchard & Sons for well-grown plants, about 5 feet through at the base, and 16 feet high; the same firm taking 1st and 2d for a double-flowered *Pelargonium*, distinct, with well-grown and profusely-flowered plants; and 1st for six *Caladiums*, in variety, with large well-coloured plants; and 1st and 2d for a like number of zonal *Pelargoniums*.

Fuchsias, *Acbimenes*, *Petunias*, *Balsams*, *Gloxinias*, &c., were all well represented in the amateur classes.

CUT FLOWERS.

These were well represented. Messrs. Heath & Son, Cheltenham, had the best stand of thirty-six Dahlias; Mr. Hans Niemand, Harborne Road, Edgibaston, Birmingham, was 1st in the classes for Carnations, and Picotees, and for hand-bouquets; Messrs. Perkins & Sons, Coventry, were 1st for a bridal bouquet; ad Messrs. Burrill & Co., Cambridge, had the best eighteen spikes of *Gladiolus*.

FRUIT.

As the result of the liberal prizes of £10, £6, and £4, for a collection of twelve kinds of fruit, and a 1st prize of £10 for six bunches of black Grapes, in three varieties, the competition in these classes was very keen, and the exhibits excellent. Seven collections were put up, and these were so near in point of merit as to cause the judges some embarrassment. Ultimately they placed Mr. Roberts, of Gunnersbury Park, Acton, 1st; Mr. Gilmao, gr. to the Earl of

FIG. 65.—LYPRIDIUM LAWRENCEANUM.

Flower in section, with some of the parts removed to show one lhp, a3, enclosed within the normal one, 1.

however, being rather poor and out of season; *Gladiolus*, *Phloxes*, *Asters*, and *Zinnias* being very good.

A very extensive lot of Sunflowers was exhibited in competition for the prizes offered.

Bouquets were well shown and well arranged, the 1st prize being awarded to Miss Ainge. Bouquets of wild flowers were particularly pretty, prominent in their construction being the common *Heath* and *Lioq*, which grow to extraordinary luxuriance in Jersey.

FRUIT.

The fruit classes were somewhat disappointing—

FIG. 66.—LYPRIDIUM LAWRENCEANUM.

Plan of arrangement of parts in fig. 65.

the collections of eight and four varieties being very poor.

Grapes were not particularly well shown, in spite of the enormous quantities grown in the island. The prize for Black Hamburgs was awarded to Mr. Pond for smaller bunches, with large berries, &c., in preference to the larger bunches with the smaller berries. The Muscat Grapes were not generally ripe.

The Peaches were inferior, Apricots large and superior, Cherries very fine, and red Currants exceedingly large and fine, especially a variety named Belle de Luxembourg, from Mr. G. De Faye. Plums

Reports of Societies.

ROYAL JERSEY HORTICULTURAL :
August 18.

THE second summer show of this spirited Society, which has flourished for over half a century, having been established in 1833, proved a success. This Society, jointly with the Royal Agricultural Society of Jersey, is the happy possessor of excellent grounds, most conveniently situate near the town, and here commodious buildings were erected, extremely well suited for the agricultural commodities. In these it was determined to try the experiment of holding the flower show. Favoured by fine weather the experiment was successful, although no one could help feeling how much better the flowers would have looked under canvas. Nothing shows up the beauty of flowers so much as canvas, especially if placed on smooth green ground. The principal feature of the show was the groups of plants arranged for effect. These were in the opinion of the judges, one and all, too crowded and mixed, one half the number of plants, placed so as to show more effectively the individuality or character of each, with a sufficiency of low Ferns, &c., to hide the pots would have produced a much better effect.

The 1st prize in class 1, shown by Mr. J. Morris, was superior as a collection to those shown by Mr. C. Godfrey, but was somewhat better arranged.

In the other classes for groups of smaller dimensions the same objections apply.

Baskets of plants were well shown, the 1st prize being awarded to Mr. J. Morris for a very graceful arrangement.

Ferns were especially well shown, the 1st prize for eight distinct being awarded to Mrs. Robin. In this collection were some extra fine specimens of *Todea*, *Asplenium*, and *Pellaea*.

In the class for four varieties Mrs. Robin was again placed 1st, as also for a single specimen, a plant of *Trichomanes radicans*, grown in cooe fashion, in the most luxuriant health and vigour; we never remember having seen a more handsome specimen. This was in addition awarded the Silver Medal of the Royal Horticultural Society as the most meritorious exhibit. A pretty class, and quite unique in our experience, was that for a basket of Ferns, the 1st prize being awarded to Mr. C. Godfrey, the basket beautifully arranged, and containing some nice examples of *Todea*, *Hymenophyllum*, &c.

Palms were well shown, the 1st prize being awarded to Miss Ainge, for well-grown small plants.

Fine-foiled plants claimed special notice, the 1st prize lots in both classes coming from Mr. C. Godfrey, who exhibited some specially good *Cycadaceae* plants; one exhibitor in this class, who had taken the liberty to oil the leaves of a *Dracana* [?], was in consequence disqualified.

Stove and greenhouse plants were fairly well shown. Zonal *Pelargoniums*, especially the double varieties, were specially well grown, the 1st prize lots of twelve and six respectively, from Mr. Bond, being remarkably well flowered and well grown.

A remarkably fine lot of *Liliums* in pots, finer than

Shrewsbury, Ingestrie, Stafford, 2d; Mr. Goodacre, Elvaston Castle, Derby, 3d; and extra 4th and 5th prizes were awarded to Mr. Parker, Impney; and Mr. Edwards, Bestwood. The Gunnersbury collection contained good Madresfield Court, Gros Maroc, Muscat of Alexandria, and Blackland Sweet-water Grapes, Lord Napier Nectarines, Ormskirk Apricots, Lady Beatrix Lamilton Tree, having a rather poor crown; Golden Perfection Melon, Sea Eagle Peaches, Figs, Cherries, and a good dish of La Grosse Sucrée Strawberries.

Mr. Pratt, gr. to the Marquis of Bath, Longleat, Warminster, secured the 1st prize (£10) for six bunches of black Grapes, in three varieties, in a well-contested class; the Black Hamburgh, Black Alicante, and Mrs. Pinck's Muscat consisted of large well-finished bunches. 2d, Mr. Stevenson, gr. of Colonel Pilkington, Presat, being 2d, with smaller but even and better coloured bunches of Black Hamburgh, Maltesfield Court, and Black Alicante; Mr. Goodacre was 3d, with Madresfield Court, Muscat Hamburgh, and Alnwick Seeding; and Mr. Gilman was 4th.

Mr. Pratt was 1st for three bunches of Muscats; Mr. Roberts, Gunnersbury, for four bunches of white, consisting of good Muscats and Foster's Seeding; and Mr. Barker, gr. to Mr. Alderman Bynes, Bickenhead, was 1st of eighteen competitors for three bunches of black Grapes, with three handsome and well finished bunches of Madresfield Court; the 2d prize going to Mr. Bennett, gr. to the Hon. C. W. Wynne, Rhug, Corwen, for Alnwick Seeding; and the 3d to Mr. N. Brownhill, Ravenswood, for Black Hamburgh. Messrs. Pritchard & Sons and Messrs. Jones & Sons, Croton Hill, were placed as equal 3d for some Grapes but little inferior to the best show.

VEGETABLES.

These made a grand show; Mr. Lambert was well to the front for a collection of twelve kinds, showing a very good even lot; Mr. Milner, Sandorne Castle, was 2d; and Mr. Purser 3d.

MAIDSTONE: August 24.

"A HORTICULTURAL exhibition in the heart of Kent" is sufficient information to give to ensure the pleasure of inspecting an abundant display of fruits, flowers, and vegetables to all who might visit the same. The show now under notice amply bore out the reputation the county of Kent has always had for superior produce. We cannot, however, but help thinking that the committee would have made the occasion a more enjoyable one had they secured some suitable grounds in which to hold the show rather than confining the same to the Corn Exchange buildings. These, though spacious enough for the productions, did not allow sufficient room for a comfortable promenade to the company present.

PLANTS.

This section of the show was not represented by an extensive display, caused no doubt by the schedule being somewhat limited, but what was lacking in quantity was amply made up in the superior quality.

For nine fine-foilage plants Mr. Waterman, gr. to H. A. Drassey, Esq., Preston Hall, was awarded the 1st prize, with plants of fine proportions in vigorous health, prominent among which were *Acahylla Macraeana*, a beautiful example of colouring, and very telling; *Alcousia Veitchii*, in good order; with fine plants of *Arca Trecesensis*, *Brabea filamentosus* (in fine character), *Cycas revoluta*, and *Croton Youngii*. Mr. Ocock, gr. to Major Roberts, Rochester, was a good 2d, staging a fine plant of *Seafornia elegans* in his collection. These two collections formed an attractive feature as a central group in the largest room.

For a group arranged for effect, the order of the two exhibitors just named was reversed, Mr. Ocock winning the Silver Cup offered as a 1st prize with a very light arrangement, bright with well-coloured *Crotons* and *Lilies*. Mr. Waterman's group was somewhat heavy in the background, but relieved to a considerable extent by the use of light and elegant *Palms*.

For a smaller group F. Pine, Esq., Maidstone, was placed 1st, with a novel arrangement, consisting of an effective background lightened up by a nice plant of *Isora Williamsii*, then dropping away to a groundwork of *Ferns*, *Gloxinias* and light *Palms* being used as a tracery to relieve the same. A. Amies, Esq., had a group of well grown *Ferns* in this class.

Four neat collections of *Ferns* were staged, the best coming from W. Fremlin, Esq., Maidstone.

CUT FLOWERS.

were excellent in quality, and the competition keen. For *Asters* (quilled) and *Zinnias*, Mr. Hicks, gr. to J. Hollingsworth, Esq., was the most successful, staging the fine blooms in each class.

The competition was sharp with *Asters* (tasselled), fourteen entries being made, the best coming from Mr. Brooks, gr. at Yeovil.

Dahlias were shown in godly numbers, the last-named again winning. A fine display was made by the baskets of cut flowers, no limit being given in respect to size, Mr. Goddard, gr. to Mrs. Banerman, winning with a choice lot in a basket some 4 feet diameter.

Boxes of cut flowers were well shown, Mr. Waterman taking 1st with twelve choice kinds, among which we noticed *Gloriosa superba*, and several good *Orchids*.

Roses were represented, but not in any considerable number. F. Warde, Esq., taking 1st.

FRUIT.

Several good collections of dried dishes were shown. Mr. Deauxbery, gr. to Lord Sarnley, Colham, being placed 1st, with a capital all-round lot of fruit—Black Hamburgh and Muscat of Alexandria Grapes, both good and equally creditable; dishes of Transparent Gage Plums and Brown Turkey Figs; Mr. Legg, gr. to M. H. Dalison, Esq., coming 2d, with finely coloured Muscats, good Nectarines and Peaches.

GRAPE.

Black Hamburghs were shown in good form. Mr. Ocock taking 1st, with three bunches of fine colour; and Mr. Chisholm, gr. to Sir Francis Geary, 2d, with bunches very fine in berry.

For two bunches, Mr. W. Blist, Wateringbury, won easily with compact bunches. With three bunches of Muscat, Mr. Legg won with fine solid bunches, and repeated his success again in the "any other black class" with fine bunches of Black Alicante.

PLUMS.

were shown in capital condition by Mr. Deauxbery who won 1st prizes for both dessert and culinary kinds, having fine fruit of Transparent Gage, Reine Claude de Bay, Washington, and Kirke's.

PEACHES.

in the class for open-air fruit brought Royal George, from Mr. Drake, gr. to Lady Fletcher, to the front; whilst from under glass Noblesse won for Mr. Nave the same position.

NECTARINES.

in similar classes were represented, in each case by Lord Napier, from Mr. Braddick and Mr. Lawrence.

PEARS.

Good dishes of Jargonelle and Williams' Bon Chretien were shown, the former kind, from Mr. Braddick, being 1st.

MORELLO CHERRIES.

were finely shown by fifteen exhibitors, the best coming from Mr. Woller, gr. to C. Edmett, Esq.

APPLES.

Good culinary sorts were shown by Mr. Waterman, who took 1st, with fine fruits of Peasgood's Nonsuch and Stirling Castle, winning again with Red Astrachan and Mr. Gladstone as dessert kinds.

OUTDOOR FRUIT.

With a collection of twelve kinds Mr. Smith, gr. to Lady Drake was 1st, with fine samples of Hale's Early Peach, Brown Turkey Figs, Violette Hative Nectarines, Morello Cherries, and Jargonelle Pears; Mr. Waterman being close up with Balgown Nectarines and other good dishes.

VEGETABLES.

This section constituted a most important feature in the show being represented by examples of first-class culture in every class.

For a collection not exceeding thirty kinds a fine display was made, Mr. Waterman winning the 1st place with a collection very effectively arranged; Mr. Ocock coming in a close 2d.

Twenty kinds.—In this class Mr. Pettitt, gr. to K. Balston, Esq., took 1st, with most creditable produce; the 2d prize going to Mr. Hollamby, gr. to Walter Monkton, Esq., with another good collection. Carrots, Onions, Celery, Peas, Tomatos, Turnips, Cauliflowers, and French Beans were well represented in each of the foregoing classes.

MISCELLANEOUS.

For a basket of salad, not less than eight kinds, Mr. Waterman again stood 1st, with a capital selection in the best of condition.

With kidney Potatoes, Mr. Deauxbery came to the front with tubers of medium but even size; and Mr. Waterman the same, with Tomatos, fine fruit, of good colour.

An important feature in the show was that part of it devoted to the farmers of Mid-Kent for fruit grown for market, to be shown in six varieties in quarter-sieves; Mr. S. H. Goodwin taking 1st, with Jargonelle Pears, New Orleans Plums, Lord Seiffeld

Apples, Cob-nuts, old black Currant and Morello Cherries—all well grown samples.

Messrs. Frost & Sons, nurserymen, of Maidstone, staged some well made bouquets, baskets of flowers, wreaths, &c., made of Roses and other flowers in season, likewise an attractive group of decorative plants, not for competition.

Messrs. Bunyard & Sons, in like manner, had a good show of Apples (Lord Suffield, Grenadier, and Potts' Seeding being the best), and Pears (Bijou and Beacon, two early kinds, were the most promising), as well as some dishes of Plums and boxes of Roses and Gladioli. &c.

SEVENOAKS HORTICULTURAL:

August 25.

THIS Society held their annual show on the above date in the grounds attached to Kippington Park, the seat of W. J. Thompson, Esq. The site chosen, one of those lovely knolls for which this beautiful district is so remarkable, contributed much to make an attractive exhibition still more enjoyable. Plants cut flowers, and fruit were well shown, the competition in many of the classes being unusually keen.

STOVE AND GREENHOUSE PLANTS.

For six stove and greenhouse plants in bloom, the 1st prize in the open division went to Mr. Gibson, gr. to T. F. Burnaby-Akins, Esq., Halstead Place, who had large and beautifully flowered specimens, consisting of *Dipladenia Brearlyana*, *D. amabilis*, *Isora Williamsii*, *P. Prince of Orange*, *Allamanda Hendersonii*, unusually well done; and *Clerodendron Balfourianum*. Mr. Bolton, gr. to Mrs. Spottiswoode, Coombe Bank, who was 2d, staged, amongst others, nicely bloomed examples of *Clerodendron fallax*, *Lapageria rosea*, and *1 Statice profusa*.

Four stove and greenhouse plants (amateurs).—1st, Mr. Vallins, gr. to J. H. Worship, Esq., with nicely grown medium sized plants, the best of which were *Laageria alba* and *Dipladenia amabilis*.

Single specimen stove and greenhouse plants in flower.—Here Mr. Gibson took 1st, with a grandly bloomed example of *Allamanda nobilis*, the finest of the species, but not so easily managed as the others more generally seen; 2d, Mr. Cook, gr. to D. Barri Crawshaw, Esq., Rosefield, who had a fine plant of *Epidendrum prismatocarpum*.

FINE-FOLIAGE PLANTS.

In the class for nine, Mr. Goodman, Bradbourne Hall, took the lead with a well grown group, the best of which were *Alcousia Thibautiana*, *Phoenix rupicola*, and *Croton Williamsii*; 2d, Mr. Gibson, having, with others, a large healthy plant of *Araucaria Bidwellii*; 3d, Mr. Bolton.

Four fine-foilage plants (amateurs).—1st, Mr. Vallins.

Caladiums were well shown by Mr. Meakin, gr. to C. R. C. Petley, Esq., who was 1st; Mr. Hatton, gr. to Mrs. S. Vazzy, The Quarry, 2d.

FERNS.

These were very well shown, Mr. Staples, gr. to H. Oppenheim, Esq., and Mr. Hatton being equal 1st, both showing large, well managed collections. Twelve *Ferns* were also in nice order, Mr. Staples taking 1st, and Mr. Bolton 2d.

FUCHSIAS.

were in good condition, well-flowered, and not over-trained, 1st honours for six going to Mr. Meakin; 2d, Mr. Huntley, gr. to the Rev. T. S. Curtis.

Four *Fuchsias* (amateurs).—1st, Mr. Vallins.

TUBEROUS BEGONIAS.

With four, in a close run, Mr. Meakin was 1st; Mr. Searing, gr. to K. Mooncock, Esq., 2d.

ZONAL PELARGONIUMS.

With six, Mr. Meakin had 1st, staging medium-sized examples well cut flowers; 2d, Mr. Hatton.

Four zonal *Pelargoniums*.—1st, Mr. Vallins.

GROUPS OF PLANTS ARRANGED FOR EFFECT are always one of the chief features at the Sevenoaks exhibitions, more competitors entering the lists than are to be found at most places—a circumstance, no doubt, owing to the space that each exhibitor is required to fill not being large, a mistake through which the framers of not a few schedules defeat the object they have in view, as when the space to be occupied is large, it takes such an immense number of plants that distant exhibitors are deterred from competing.

In the leading class for groups of flowering and fine-leaved plants, Mr. Meakin, took the lead with a very beautiful arrangement; Mr. Cook being a good 2d.

In the second division of groups, Mr. Vallins had 1st, with a nicely arranged exhibit; 2d, Mr. Searing.

The groups confined to Ferns alone, were remarkably well done. Mr. Staples taking 1st honours; Mr. Hatton, who was 2d, also showed well; 3d, Mr. Goodman; 4th, Mr. Bolton.

CUT FLOWERS

were present in quantity. With twenty-four Roses, Mr. Gray, gr. to Earl Stanhope, was 1st, putting up a nice stand of blooms; 2d, Mr. Holiingworth, Maidstone.

Twelve Roses.—1st, Mr. Blundell, gr. to G. Christy, Esq., 2d, Mr. Gibson.

Dahlias were very well shown, Mr. Searle, Vine Nursery, taking 1st for twenty-four; 2d, Messrs. Cannell.

Twelve Dahlias.—1st, Mr. Godden, gr. to Mrs. Brook; 2d, Mr. Meakin.

Twelve *Cactus Dahlias*.—1st, Mr. Meakin; 2d, Mr. Hoadley, gr. to F. L. Bevan, Esq.

Six varieties of single Dahlias, three blooms of each.—1st, Mr. Bolton; 2d, Mr. Cook.

Six *Gladioli*.—1st, Mr. Cook; 2d, Mr. Gibson.

Six *Phloxes*.—1st, Mr. Staples, with fine spikes; 2d, Mr. Bolton.

Of stove and greenhouse flowers there was a good display, Mr. Cook taking the lead with twelve varieties, all Orchids, including fine spikes of *Vanda suavis*, *V. tricolor* Patersonii, *V. insignis*, *Cattleya Gaskelliana*, *Rosefield variety*, *C. speciosissima*, *C. Leopoldi* and *Odontoglossum crispum*; 2d, Mr. Gibson, who likewise had a fine stand.

Table decorations, bouquets, &c., as usual here, were in great force, filling a good sized tent. In a close competition in the class for three stands, Mr. F. W. Seale was 1st, and Mr. Hatton, 2d.

Single stand.—1st, Mr. F. W. Seale; 2d, Mrs. Bishop.

Single groups of wild flowers were likewise beautifully arranged, Mrs. Hassell taking 1st; Mr. F. W. Seale, 2d.

Basket of flowers.—1st, Miss Seale; 2d, Mr. Hoadley.

For a hand-bouquet Mrs. Bishop had the 1st award; Mr. Seale, 2d.

Three button-hole bouquets.—1st, Mr. Bolton; 2d, Mrs. Bishop.

FRUIT

was forthcoming in large quantities and good condition, if we except Muscat Grapes, which with few exceptions were much deficient in colour. In the class for six dishes of fruit Mr. Henson, gr. to T. Johnson, Esq., Bromsleigh, had 1st, with Black Hamburg and Golden Hamburgh Grapes, not large bunches, but very well coloured; Goshawk Peaches, Downton Nectarines, and a nice dish of Negro Largo Figs, and a Melon; 2d, Mr. Gray, whose best dishes were Black Hamburg and Muscat of Alexandria Grapes; 3d, Mr. Goodman.

Four dishes of fruit.—1st, Mr. Searing; 2d, Mr. Gibbons, gr. to F. Scudamore, Esq., Maidstone.

Single Pine.—1st, Mr. W. F. Smith, gr. to Mrs. Byass, Neville Court, with a fine fruit of Smooth Cayenne; 2d, Mr. Henderson, gr. to W. J. Deacon, Esq.

Three bunches of black Grapes.—Of these there were ten exhibitors, Mr. Staples taking the lead with Black Hamburg, in good condition; 2d, Mr. W. Henderson, who also had Black Hamburgs; 3d, Mr. Henderson, with Muscat Hamburgs.

Two bunches of black Grapes.—1st, Mr. Searing; 2d, Mr. Hoadley.

Three bunches of white Grapes.—In this class there were eight competitors, Mr. Gray being 1st, with Muscat of Alexandria, compact bunches, nicely coloured; 2d, Mr. Denton, gr. to A. T. Beeching, Esq., who had Buckland Sweetwater, fine bunches, beautifully coloured; 3d, Mr. C. Goldsmith, gr. to E. A. Loare, Esq.

Two bunches of white Grapes.—1st, Mr. Hoadley; 2d, Mr. Martin, gr. to W. Johnson, Esq.

Three varieties of Grapes, one bunch of each.—1st, Mr. Gray, who staged Black Hamburg, Foster's Seedling, and Muscat of Alexandria; 2d, Mr. Henson, with the same varieties; 3d, Mr. Goodman.

Melon.—1st, Mr. Ham, gr. to J. S. Johnson, Esq., with Hero of Looking; 2d, Mr. Searing.

Dish of Peaches.—1st, Mr. Goodman, with grand examples of Royal George, very highly coloured; 2d, Mr. Goldsmith, with Princess of Wales.

Dish of Nectarines.—1st, Mr. Goodman, with good examples of Pitamast Orange; 2d, Mr. Henderson.

Dessert Plums were present in large quantities and fine condition. With three dishes Mr. Staples had 1st; Mr. Waterman, 2d.

Three dishes of culinary Plums.—1st, Mr. Staples; 2d, Mr. Bolton.

Of Apples, both dessert and culinary, there was abundance. With three dishes of dessert kinds Mr. Waterman had 1st; Mr. Staples 2d.

Three dishes, culinary varieties.—1st, Mr. Waterman; 2d, Mr. Cook.

Three dishes of desert Pears.—1st, Mr. Waterman; 2d, Mr. Staples.

Dish of Cherries.—1st, Mr. Waterman; 2d, Mr. Vallis.

Mr. Carlton, gr. to Lord Hillington, exhibited, not for competition, a specimen of *Lilium auratum* with 142 flowers on twenty stems. The plant was grown in a 15-inch pot. It well deserved the Cultural Commendation that was awarded to it.

Cut flowers, not for competition, were contributed by the Westernham Nursery Company; a stand of fruit and flowers, by W. H. Smith; Dahlias, large-flowered, poupon, and single varieties, by Mr. Seale; and a group of Ferns by Mr. F. Webber, Quarry Hill Nursery, Tonbridge.

HARPENDEN HORTICULTURAL:

August 25.

FAVoured with brilliant weather, such as must cheer the hearts of horticulturists and agriculturists alike, the eighth annual exhibition of flowers, fruits, vegetables, and honey held by this Society proved a decided success. The site of the show was, as previously, by the kind permission of Sir J. B. Lawes, Park, (easy access to the village and railway station, Harpenden has acquired a reputation in the county for the excellence of its horticultural shows, and the one just held far exceeded in extent and importance those of previous years. The entries were considerably more numerous, and the general character and arrangement of the show was very creditable. Prizes to the amount of nearly 700 were offered for competition, and the total number of exhibits sent was about 700, the contest being exceedingly keen in many of the classes.

A new feature in the schedule this year was a division confined to agricultural labourers, special prizes for this purpose being offered by several gentlemen in the locality.

The exhibits were tastefully arranged under two spacious marquees, a separate tent being set apart for table decorations and other floral designs contributed by lady competitors.

PLANTS.

Reverting to the order of the schedule, the first on the list is a class for six stove and greenhouse plants, in flower, distinct. Two collections only were staged, both excellent, but the judges had little difficulty in awarding premier honours to C. R. Fenwick, Esq., High Firs, Harpenden (gr. Mr. G. Underwood), for *Vinea rosea*, a really magnificent plant, loaded with blossoms; Allamanda Schottii, Dipladenia amabilis, Clerodendron Balfourianum, C. fallax, and Pentas carried a perfect beauty. The 2d prize went to J. Blandell Maple, Esq. (gr. Mr. T. Nutting), Childwickbury, St. Albans, who showed specimens of *Bougainvillea glabra*, *Dipladenia boliviensis*, *Pinnaculoa expensis*, *Allamanda Hendersonii*, *Vinea olivacea*, and *Dipladenia Brearleyana*. These collections elicited the praise of all.

GROUPS OF PLANTS.

Facing the visitor on entering the largest tent was a brilliant group of flowering plants, also from the conservatories of Mr. C. R. Fenwick, High Firs, Harpenden, shown in competition for a special prize offered by H. T. Hodgson, Esq. This display, for wealth of colour, beauty of form, and general arrangement was unsurpassed by anything in the show, and easily won 1st place. The collection comprised among others, specimens of *Vinea alba*, *Bougainvillea glabra*, *Campanula pyramidalis* (a fine example), *Dipladenia alba*, *Clerodendron fallax*, *Lilium*, *Azeca*, *Eugenia*, *Begonia*, and some exceptionally good *Cockscomb*, Mr. Cannell's gain. H. T. Hodgson, Esq. (gr. Mr. C. Sibley), was the only other competitor in this class, and staged a very pretty and effective group, taking 2d prize.

In the class for six foliage plants (distinct), J. Blundell Maple, Esq. (gr. Mr. T. Nutting), Childwickbury, was 1st with *Cissus discolor*, *Croton Brongnia* James de Rothschild, one of the richest coloured varieties in cultivation; *Azeca Verschaffeltii*, *Croton Evansianus*, *Acalypha muscica*, and *Azeca luteoens*. J. S. Hill, Esq. (gr. Mr. W. F. Emptage), Hawkswick, St. Albans, came in 2d with examples of *Anthurium crystallinum*, *Pandanus Veitchii*, *Adiantum Farleyense*, *Cissus discolor*, *Musa Cavendishii*, and *Platycerium alcornae*, a fine specimen of the Sag's-horn Fern.

For special prizes offered by C. R. Fenwick, Esq., High Firs, for a group of plants arranged for effect, on staging 12 feet by 6 feet, two very interesting collections were arranged. Mr. T. Nutting, Childwickbury, led the list with *Caladiums*, *Liliums*, *Crotons*, a capital group specimen of *Sealthoria elegans* occupying the centre. The groundwork chiefly consisted of Maidenhair Ferns, being broken up by other varieties of diverse habit, forming a very pleasing group; Mr. J. S. Hill (gr. Mr. W. F. Emptage), Hawkswick, St. Albans, was awarded 2d prize, with a capital assortment of *Droseras*, *Falms*, Ferns, *Begonias*, and *Caladiums*—

the specimens meriting particular notice being *Diefenbachia sanguinea picta*, *Ophiopogon Jaburum aureo-variegatus*, and *Fittonia Perreici*.

BEGONIAS.

Some remarkably fine tuberous Begonias were shown by H. T. Hodgson, Esq. (gr. Mr. C. Sibley), winning 1st prize; Mrs. Warde (gr. Mr. G. Smith), Bennets, Harpenden, taking 2d honours, in which collection we noticed one of Cannell's crimson scarlet doubles, a perfect gem, showing monstrous bloom.

FUCHSIAS.

Of the special prizes offered by J. B. Maple, Esq., for Fuchsias, the 1st was awarded to Mr. H. T. Hodgson, for an attractive lot of well grown plants; Mrs. Warde (gr. Mr. G. Smith), Harpenden, being a good 2d. In consideration of the excellence of his exhibit, G. Burnand, Esq. (gr. Mr. W. Pepper), Tiffin Water Park, was awarded an extra prize in this class.

MISCELLANEOUS.

Zonal Pelargoniums, both single and double, showed up in excellent forms, 1st prize for singles going to Messrs. East (gr. Mr. W. Littlechild), Highfield Hall, St. Albans; and the 2d to Mr. H. T. Hodgson.

In the doubles R. Mather, Esq. (gr. Mr. D. Simmonds), Kirkwick, Harpenden, took premier honours, an extra going to Messrs. East, of Highfield Hall, St. Albans.

Colours.—Mr. R. Mather was the only competitor in the class for Colours, and was awarded Mrs. Olive's special prize for half-a-dozen capital plants, clean and well grown, which would have had little difficulty in holding their own in a more extensive competition.

Ferns.—The class for six exotic Ferns, for special prizes offered by Mrs. Baxendale, Blackmore End, Welwyn, was well contested. Mr. Fenwick, High Firs, Harpenden, carrying off 1st; Mr. G. Burnand, of Tiffin Water Park, coming 2d, the unsuccessful competitors being Mr. J. S. Hill, Hawkswick, St. Albans, and G. N. Martin, Esq. (gr. Mr. F. H. Fould), The Bank, St. Albans.

At the lower end of this tent was a neatly arranged group of plants sent in, not for competition, by Sir J. B. Lawes (gr. Mr. W. Over).

CUT FLOWERS.

As usual at Harpenden cut flowers, especially Roses and Dahlias, occupied a most prominent place, a grand collection of Roses from the nurseries of Messrs. W. Paul & Son, of Waltham, not for competition, were the admiration of all visitors. Roses of every hue, so fresh and bright and numerous were exhibited, that the mind pictured to itself the scenery of the Rose garden at Waltham Cross in full summertime. The collection comprised many of the newest and most beautiful varieties, including Madame William Paul, Comte Benoit, Charles Lamb, Colonel Felix Beute, Directeur Alphonse, Ella Gordon, Mlle. Julie Gaultain, Marshall P. Wilder, Lord Frederick Cavendish, Professor Edward Regel, Mrs. George Dickson, and many charming varieties of the Bourbon, Teascented, and Noisette perpetuas.

ROSES: COMPETING CLASSES.

In the class for forty-eight cut Roses of distinct varieties, the well-known growers, Messrs. G. Paul & Sons, Cheshunt, made a splendid show, and deservedly occupied the 1st position, some of the newer kinds especially pointed out being G. Baker, Duke of Albany, Sunset, Madame Nonin Nerdus, Marshall P. Wilder, Madame Bertha Mackert; others equally good being Madame Eugenie Verdier, Black Prince, Stranice, A. K. Williams, John Stuart, Madame Victor, and Mlle Julie Gaultain. The Rev. W. H. Jackson, M.A., Stagden Vicarage, took 2d, with a collection well worthy of notice, among which we observed a very pretty and new variety named after the Princess of Wales, and another the Countess De Lenzina.

Messrs. G. Paul & Sons also stood 1st with twelve Tea Roses, including Beauté de l'Europe, Sunset, Madame Eugenie Verdier, and the best of the older varieties—Innocentia Prokla, a cream-coloured bloom, most delicately scented. The Rev. W. H. Jackson again ranked 2d, with a well-finished lot.

DAHLIAS.

For the prizes for Dahlias of forty-eight distinct varieties Mr. Henry Glasscock, of Bishop Stortford, and Messrs. G. Paul & Sons, Cheshunt, were the only competitors, and the former, whose association with Dahlias is well known, exhibited one of the finest collections we ever remember to have seen—in fact they were superb, and embraced choice blooms of I. Williams, Flag of Truce, General Gordon, Ethel, Briton, Bird of Passage, Mrs. Gladstone, Mrs. H. Glasscock, Burgundy, Imperial, Daches of Albany, Senator, Joseph Green, Wizard, Mrs. Langtry, and Romeo.

For the collection of twenty-four varieties, Mr. T.

Jarrett, South Mill, Bishop Stortford, was 1st, with a collection that was admitted; the 2d prize winner being Messrs. East (gr., Mr. Littlechild), Highfield Hall, St. Albans.

Mrs. Drake Jarard, of Lamer Park, Wheathamstead (gr., Mr. G. Tilbury), was the only exhibitor in the class for twelve Dahlias, and was awarded 2d prize.

Mr. J. Henshaw, of Harpenden, whose reputation as an amateur in the growth of these flowers is well known in the floral world, exhibited some excellent bunches of pompon Dahlias, capitally staged, and easily winning premier honours; the varieties included Professor Berguet, Darkness, Sensation, Golden Gem, Fashion, Hercules, Dora, Butterfly, and Guiding Star. Messrs. East, Highfield Hill, St. Albans, were 2d in this class. Herbaceous cut flowers and Asters were also admirably shown, there being a keen competition with the latter.

FRUIT.

The display of fruit was upon the whole good, and fairly represented; fine bunches of Muscat of Alexandria Grape, exhibited by Mr. J. B. Maple, were particularly noticeable. Fruit, eight sorts, distinct, 1st prize also awarded to J. B. Maple, produce shown being Cherries (Bigarreau), Figs (Brunswick), Apricots (Moore Park), Melon (Masterpiece), Green Grape Plum, white Grapes (Muscat of Alexandria), black Grapes (Black Hamburg), and Peaches, not very first-rate. There were four competitors in this class, the two last of whom were adjudged equal.

G. N. Marten, Esq., The Bank, St. Albans, gained 1st prize for a Melon, for which there were eight entries.

VEGETABLES.

All kinds of vegetables were strongly shown, and the exhibits remarkably good, Potatoes being particularly worthy of notice, and pointing to a decided improvement in the cultivation of this tuber in the neighbourhood.

In the class for twelve sorts of vegetables, Mr. T. A. Beckett, of Penn, Amersham, deservedly gained 1st, the produce showing being—Pens, Duke of Albany; Beans, Canadian Wonder; Tomatoes, Carter's Perfection; Carrots, Sutton's New Intermediate; Beans, Champion Runner; Celery, Leicester Red; Onions, White Elephant; Artichoke, Green Globe; Cauliflowers, Walcherin; Marrow, Pen-y-tyd; Beets, Pragnell Exhibition; Potatoes, Vicar of Laleham. There were six competitors in this class, the 2d prize going to H. Hoare, Esq. (gr., Mr. F. Faint), Marden Hill, Hertford; and the 3d prize to H. T. Hodgson, Esq. (gr., Mr. C. Sibley), Harpenden.

LADIES' DIVISION.

The table decorations were pretty and attractive. Mrs. Maddell, Harpenden, was awarded 1st for a very artistic arrangement, yellow and pale-pink flowers being nicely blended with the Maidenhair Fern and some choice fruit, including Black Hamburg Grape, Plums, Peaches, Figs, Melon, and Pears. Mrs. Whitbread Roberts was 2d, with a light and effective table, which in some points was superior to the 1st prize winner, the flowers used being yellow Marguerites, Orchids, Begonias, Vallota purpurea, and Eucharis amazonica. Mrs. Stirling came in 3d, with a somewhat aesthetically arranged table, too flat and heavy, although the materials were choice.

Vases, button-holes, and baskets were sent in fair numbers for competition.

Owing to the unfavourable season for honey, the exhibits in this department were considerably fewer than usual, but the quality was excellent. 7. II.

THE DEVON AND EXETER HORTICULTURAL: August 25.

The above Society held its exhibition on the beautiful grounds of Northhay, Exeter, under the most favourable circumstances as regards the exhibits, attendance, and the weather, which latter was all that could be desired. In the evening the whole of the tents and grounds were illuminated by thousands of coloured lamps, &c., producing a most charming and novel effect, and which proved highly attractive, for during the afternoon and evening between 4000 and 5000 persons visited the show, which has not been anything like equalled for a great number of years past.

The exhibits were excellent in every class. The plants—a matter of course when we find Mr. Locke, gr. to B. W. Cleare, Esq., of Newtonabes, Crediton, taking the lead in most of the principal classes with plants that have figured at all the principal shows in the West this season as prize winners. Mr. Rowland, gr. to W. Brock, Esq., was not far behind in many instances, which means that he was a good 2d.

Mr. Teed, gr. to Mrs. Ensor, The Bungalow, Topsham Road, Exeter, came out well with stove and greenhouse flowering plants, and bids well to take a leading position in the future.

Fruit was, without exception, remarkably fine and well coloured, and each class was generously contested.

But perhaps vegetables created as much interest as anything owing to the fact that one of the Veitch Memorial prizes and £5 were offered for a collection of twelve kinds, supplemented by good 2d and 3d prizes by the Society. The competition was strong and keen. Mr. Garland, gr. to Sir Thomas Acland, Killerton, was the successful prize winner, whose exhibits received the full number of points in the judges' estimation. Mr. Leach, gr. to John Drew, Esq., Park Villas, Kenton, the previous winner of the Veitch Memorial prize at Exeter, took 2d, with an admirable collection; Mr. W. R. Baker, gr. to the Rev. P. L. D'Acland, being a good 3d.

A second collection of vegetables, consisting of ten kinds, the prizes being given by the firm of Lucombe, Pince & Co., was equally strongly contested, Mr. Garland again succeeding in distancing his brother competitors; Mr. Sparks, gr. to A. Barnett, Esq., of Tiverton, an old 1st prize-taker, being 2d, with a very creditable lot; 3d, to Col. Troyte.

The single dishes of vegetables were all of superior merit, which shows that, despite cold weather in spring and drought in summer, crops have not suffered very much.

The two large firms of Lucombe, Pince & Co. and Veitch & Son, of Exeter, as usual, contributed largely to the attractions of the show.

Messrs. Veitch filled up one end of the large tents with ornamental rockwork, clothing it with creeping and other plants, most cleverly arranged by Mr. Meyer, their landscape gardener, who has become famous in the West for his taste and skill in this department. In the evening, when it was lit up with various coloured and Arabian lamps, the effect was most beautiful. The same firm staged a great variety of Japanese Maples, of varied hues and most graceful habits; boxes of pompon Dahlias, arranged in bunches with buds, just as those kinds of Dahlias should be shown; Fuschias, a nice fiery red, Cupid, fan-like form, White Button, Golden Canary, a splendid yellow; Little Duchess, and Little Bobby being the best of them. Boxes of Roses were also shown in good form, also double Dahlias, double Begonias (a magnificent lot), single Begonias, herbaceous and other flowers.

Messrs. Lucombe, Pince & Co. contributed a fine mixed collection of stove and greenhouse foliage and flowering plants in their usual form. Almandas in variety and well flowered; Patermariums, Yallous, Heaths, Crotons in great variety, Ferns backed up with fine specimens of Palms such as Cocos Weddelliana, Corypha australis, Latania, Tree Ferns, &c.—altogether a most pleasing and effective group. These were supplemented on tables opposite with boxes of herbaceous Phloxes, a white Aster called Mignonette, a beautiful white; Niphetos Roses, a superb lot; pompon Dahlias—Guiding Star, Duchess, Little Arthur, Little Helen, Gem, Mabel, Little Miss, &c.; very dark variety; Garnet, fiery red; Glow-worm, and Dora, a lovely white, were the best. Several other varieties of Dahlias were staged in boxes of each, of superior merit.

OPEN COMPETITION.

Twenty-four Roses, distinct.—Only one competitor, This was awarded 2d prize, Mr. Teed being the only one that came up to the scratch.

Forty-eight Dahlias, double, distinct.—1st, Mr. J. Nation, Taunton, a well known Dahlia grower, his best flowers being Mr. F. Foreman, purple; James Hanley, dark red; Thomas Gordon, fine dark maroon; James Cocker, General Roberts, Rev. J. B. Camm, Artistie (fancy), very good; Mrs. J. C. Reid, Emily Edwards, beautiful flesh colour; Prince Bismarck, Pioneer, very dark; Ethel Britton, Jessie McIntosh, and Modesty. 2d, Mr. Crump, gr. to Mrs. Hart, who was a capital 2d.

Forty-eight Gladioli, distinct.—Mr. Dobree, of Wellington, had the field to himself with a superb lot of blooms.

Eighteen bunches of cut flowers, distinct.—1st, Mr. Locke; 2d, Mr. Rowland, both showing first-class lots of blooms.

PLANTS.

Nine stove and greenhouse plants, in flower.—1st, Mr. Locke, who staged fine specimens of *Diplazium analablis*, *Eucharis*, *Ixora Williamsi*, grand; *Allamanda Hendersoni*, *Ericas Martockiana*, *Iryana*, and *retorta* major, &c.; Mr. Teed taking 2d with a very fine lot of healthy and well-flowered specimens, having *Ivoras Prince of Orange* and *Williamsi*, beautifully flowered.

Six stove and greenhouse plants, in flower.—1st, Mr. Rowland, who staged a capital lot, his *Diplazium analablis* being extra good.

Nine stove and greenhouse foliage plants, distinct.—1st, Mr. Locke, with a grand lot, comprising *Crotons Weismanni* and *Warreni*, splendidly coloured; *Latania borbonica*, grand plant; *Kentias Balmoreana* and *australis*, both fine specimens; *Areca lutescens*, *Euphorbia villosa*, a magnificent *Palau*; and *Croton Williamsi*. Mr. Rowland took 2d, also with

a fine collection; his *Crotons Andreanus* and *Disraeli* being especially well coloured.

Nine stove and greenhouse Ferns.—1st, Mr. Locke, with *Marattia Cooperi*, a grand and rare variety; *Davallia Tyermanni*, *Gleichenias rupestris*, *glaucescens*, *splenacea*, and *Mendellii*; *Davallia polyantha*, and *Adiantum trapeziforme*. Mr. Rowland again took 2d, his best being a grand piece of *Neottopteris nidus-avis*, *Dicksonia antarctica* and *Alsophila australis*.

Six stove and greenhouse Ferns.—Mr. Mollon, gr. to Mrs. Ponget, and Mr. Teed, were placed equal 1st, each staging well.

MISCELLANEOUS GROUP OF PLANTS,

arranged for effect, on 100 square feet of staging.—1st, Mr. Lock, who retrieved his position this year, having on the last occasion been beaten by Mr. Rowland, who now took the 2d prize. Both collections were examples of perfect skill and taste in cultivation and arrangement, Mr. Locke's small *Crotons* being perfectly coloured, his groundwork of *Maidenhair* being good, and he has improved upon former years by introducing more flowering plants, which this season did him good service.

Miscellaneous group, arranged for effect, on stage 5 feet square.—1st, Mr. Teed, who staged with good taste; 2d, Mr. Mollon, whose foliage was rather too heavy.

Six Fuschias.—1st, Mr. Staddon, gr. to Colonel Courtenay, Millbrook House, Topsham, who staged capital plants, and well flowered; 2d, Mr. Mollon, who had fine pyramidal and well-flowered plants also. Six *Lycopodiums*.—1st, Mr. Locke; 2d, Mr. Teed.

Nine *Gloxinias*.—1st, Mr. Staddon, with a very nice fresh lot; 2d, Mr. Rowland.

Twelve British Ferns.—1st, Mr. Mollon; 2d, Mr. Locke.

Six *Cocks-combs*.—1st, Mr. Mollon, with splendid heads of bloom.

Six double *Begonias*.—1st, Mr. Geeson, gr. to Lord Halton, who had some capital plants, varieties raised by himself, and not surpassed—*Sulphur Queen*, *Perfection*, *Exoniensis*, *White Lady*, *General Gordon* (Laog); 2d, not awarded.

Six single tuberous-rooted *Begonias*.—1st, Mr. Rowland; 2d, Mr. Couther, gr. to Mark Farran, Esq.

Six dinner-table plants.—1st, Mr. Rowland.

Six *Dracenas*, distinct.—1st, Mr. Rowland.

Six zonal *Pelargoniums*, double, distinct.—1st, Mr. Staddon; 2d, Mr. Mollon.

Six single ditto.—1st, Mr. Staddon.

CUT FLOWERS.

Twelve Dahlias, *Jurezi* (*Caetus Dahlia*).—Twelve competitors entered, forming a very showy class. 1st, Mr. Crump, gr. to Mrs. Hart.

Twelve Gladioli, distinct.—1st, Mr. Dobree; 2d, Mr. Nation.

Twelve Roses, distinct.—1st, Mr. Evans, gr. to Captain Chrisy, who staged a first-class lot of blooms, equal to first crop.

Twelve Asters, incurved.—1st, Mr. Nation; 2d, Mr. Couther.

Twelve Asters, reflexed.—1st, Mr. Crump; 2d, Lady Bowring.

Twelve single *Pelargoniums*, distinct.—1st, Mr. Solmon, gr. to W. Dunford, Esq.; 2d, Mr. Sparks.

FRUIT: OPEN.

Collection of ten distinct kinds.—1st, Mr. Locke, with a very nice lot of fruit indeed; 2d, Mr. Teed.

Collection of six distinct kinds.—1st, Mr. James, gr. to Sir John Walrood; 2d, Mr. Mairs, gr. to Sir John Shelley.

One *Pine-apple*.—1st, Mr. Bull, gr. to Sir Redvers Buller.

Three bunches of Black Hamburg Grapes.—1st, Mr. Stevens, gr. to C. D. Case, Esq., Ledbury Manor, Sidmouth, who had nice bunches, fine in berry; 2d, Mr. James, whose bunches were larger and better coloured, but small in berry.

Three bunches of Muscat of Alexandria.—1st, Mr. Stevens, with fine examples; 2d, Mr. Barnes, gr. to J. C. Daniels, Esq., Stoodleigh Court, Fiverton.

Three bunches of Madresfield Court Grapes.—1st, Mr. W. Langworthy, gr. to G. P. Benmore, Esq., Exmouth, with three magnificent bunches, each from 4 to 6 lb., perfectly finished; 2d, Mr. Pike, gr. to Rev. Clarke, Exmouth.

Three bunches of Alicante.—1st, Mr. Locke, with first-class fruit.

Three Foster's Seedling.—1st, Mr. Maris, rather small in bunch and berry.

Three Buckland Sweetwater.—1st, Mr. Langworthy.

Nine Peaches.—Numerously contested, and all splendid examples. 1st, Mr. Marsh, gr. to Sir J. Freake, Warfield, Dartmouth, with Sea Eagle; 2d, Major Porter.

Nine Nectarines.—1st, Mr. Barrow, very fine fruit; 2d, Mr. Geeson.

Melon, green or white fl. h.—1st, Mr. J. Dane,

gr. to the Rev. T. J. Varde, Chadleigh; 2d, Mr. A. Williams, gr. to W. C. Leio, Esq.
 Melon, scarlet-flesh.—1st, Mr. J. Elliot, with Sutton's Invincible, the best Melon staged; 2d, Mr. G. Hamilton.

Nine Apricots.—1st, Mr. Scammell, gr. to W. Pope, Esq.; 2d, Mr. McMillan, gr. to Sir J. Stuckley, Bideford.

Nine Figs.—Mr. Isaac, gr. to B. J. Gidley, Esq., Exeter.

Nine Pears.—1st, Mr. Lang, gr., to Lord Poltmore; 2d, Mr. Geeson.

Nine Apples, dessert.—1st, Mr. Geeson, with Irish Peach; 2d, Mr. Langworthy.

Nine Apples, culinary.—1st, Mrs. Rowe; 2d, Mr. E. A. Sander, both showing Lord Suffolk.

Twelve Plums, yellow or green.—1st, Mr. Mairs; 2d, Mr. Lang.

Twelve Plums, red or purple.—1st, Rev. P. Williams; 2d, Mr. James.

VEGETABLES: OPEN.

Collection of vegetables, twelve kinds, exclusive of red Cabbage and saladng.—1st prize, Veitch Memorial Medal and £5, supplemented by a 2d and 3d prize of £3 and £2, by the Society.—1st, Mr. Garland. This was indeed a superb collection, of clean growth, and well merited the award. It included Nonpareil Cabbage, Incomparable Dwarf White Celery, fine Autumn Giant Cauliflower, Veitch's Red Globe Turnip, New Intermediate Carrot (Veitch's), remarkably fine; Gifford Giant Runner Bean, Sutton's New Seedling Potato, Hathaway's Excelsior Tomato, good; Tender and True Cucumber, Duke of Albany Pear, and Giant Rocca Tripoli Onion. 2d, Mr. Leach, who also staged a splendid collection, which included International Potato, fine; Hathaway's Tomato, Duke of Albany Pear, Gifford Giant Runner Bean, Sulham Prize Celery, as his best dishes.

Collection of Vegetables, twelve kinds, exclusive of red Cabbage and saladng. Prize of £5 5s, given by Messrs. Lacombe, Picee & Co.—Here again Mr. Garland distanced all other competitors; Mr. Sparkes, an old prizeman, coming in 2d with a capital lot.

READING HORTICULTURAL: Aug. 25.

THE Autumn exhibition took place, as usual, in the Abbey ruins, the approach being through the Foreby Gardens, now in excellent condition, under the management of Mr. Phippen. There was a decided falling off in plants, but cut flowers, fruits, and vegetables were very strong; still, the turf banks in the Abbey ruins are intended for plants, and when these are absent there is an inevitable appearance of nakedness.

FLOWERING PLANTS.

The only exhibitor of nice stove and greenhouse plants was Mr. J. F. Mould, of Pewsey; the only exhibitor of four plants Mr. Armitage, gr. to N. Clarke, Esq., Reading.

Mr. Mould had the best specimen plant, a good piece of Erica Austriana; Mr. Jennings, gr. to J. Freeman, Esq., Farnborough, with a good specimen of Eucharis amazonica.

Mr. Bright, gr. to P. Karslake, Esq., White Knights, Reading, had some of the best Uchias which have been seen at Reading for some time, and he was 1st in both classes for four plants.

Balsams were fairly good, and some excellent Cockscombs came from Mr. Booker, gr. to C. Little-wood, Esq., Teyford.

Mr. Hatch, gr. to B. L. Stevens, Esq., Reading, had the best six Liliums, staging well-grown and bloomed examples of varieties of L. speciosum.

Mr. Dockerell, gr. to W. J. Palmer, Esq., was 1st, with six good plants of tuberous-rooted Begonias; Mr. Sumner, gr. to J. H. Millard, Esq., Reading, being 2d.

FOLIAGE PLANTS.

Mr. Mould was the only exhibitor of six foliated plants, taking the 1st prize with a very creditable lot. Mr. Dockerell had the best six stove and greenhouse Ferns—small but well grown; Mr. Mould being 2d.

Some admirably grown Lycopodiums came from Mr. Dockerell.

Mr. Mould had the best three Palms, Mr. Phippen being 2d.

Coleus were well shown by Mr. E. Jones, nurseryman, Henley-on-Thames, and Mr. Best, gr. to W. Cheate, Esq., The Vine, Basingstoke.

Bedding Pelargoniums of the variegated section were well presented by Mr. Sumner.

Some capital table plants were shown by Mr. T. Lockie, gr. to G. O. Fitzgerald, Oakley Court, Windsor; Mr. Howe, gr. to Sir R. Sutton, Benham Park, Newbury.

GROUPS ARRANGED FOR EFFECT.

On this occasion Mr. Phippen was placed 1st, and

Mr. Sumner 2d, but both fell below the usual average of the groups seen at Reading.

CUT FLOWERS.

Mr. C. Turner, Royal Nursery, Slough, sent several stands of excellent Dahlias, but did not compete. The best eighteen came from Mr. John Walker, nurseryman, Thame; Mr. J. Tranter, Upper Assenden, Henley-on-Thames, being 2d, an extra prize being awarded to Messrs. J. Cheal & Sons, Nurserymen, Crawley.

Mr. Tranter had the best twelve fancy Dahlias; Mr. John Walker being 2d.

Asters, both quilled and trench, were numerous, and very fine. Mr. John Walker being 1st in both classes; the Cockage or crown-flowered varieties were not so good, and scarcely deserve a place in the schedule.

Mr. Owen, nurseryman, Maidenhead, was 1st with a fine lot of twelve spikes of Gladioli; Mr. Jackson being 2d.

Double Zinnias were a very fine feature; the best eighteen came from Mr. Benham, Bagnor, Newbury; Mr. Walker being 2d; and his style of staging is certainly to be preferred, showing also about 4 inches of stalk with leaves.

Mr. Jennings, gr. to J. Freeman, Farnborough, had the best eighteen bunches of cut flowers; Mr. Phippen being 2d.

Mr. Booker had the best twelve bunches, Mr. Howe being 2d.

TABLE DECORATIONS, &c.

The best three vases for a dinner-table came from Messrs. Phillips, Reading, exquisitely arranged; Miss Simonds, Cavendish, being 2d.

Messrs. L. Cole & Co., Reading, had the best three vases of wild flowers; Miss, M. Taylor, Cravenhurst, Reading, being 2d.

Messrs. L. Phillips were 1st with a basket of sweet-scented flowers; Messrs. L. Cole, Reading, being 2d.

The best bridal bouquet came from Messrs. Perkins & Sons, Coventry; Mr. Phippen, Reading, being 2d. The former had the best three button-hole bouquets; Mr. Phippen, 2d.

FRUIT.

The best collection of eight dishes came from Mr. Goodman, gr. to C. Hammersley, Esq., Bourne End, who had Black Hamburgh and Muscat of Alexandria Grapes; Dr. Hogg Peach, Windsor Pears, Humboldt Nectarine, Shepley Apricot, Victory of Bristol Melon, and Brown Turkey Figs—a very good lot indeed; 2d, Mr. Ashby, gr. to W. Faoning, Esq., Whitechurch; Mr. Howe, Benham Park, being 3d.

The best six dishes came from Mr. G. H. Richards, the Gardens, Somersley, Kingwood; Mr. Lockie, Oakley Court, Windsor, being 2d.

The best three bunches of Black Hamburgh Grapes came from Mr. Bowerman, gr. to C. Hoare, Esq., East Hackwood Park, excellent specimens; Mr. Turton was 2d; and W. Ashby, 3d.

Mr. Cakeread, gr. to Sir F. Rose, Bart., Raynor's, Penn, Bucks, was 1st in the class for any other black with Madresfield Court; Mr. Wells, gr. to Ravenhill, Esq., Winkfield, being 2d with Cooper's Black.

Mr. Cakeread had the best three bunches of White Muscat, a very good sample indeed; Mr. Maher, gr. to A. Waterhouse, Esq., Vattenden, being 2d.

Mr. K. Kaeeler, gr. to W. S. Tortal, Esq., Malsanger Park, Basingstoke, was 1st with any other white, staging very fine Buckland Sweetwater; Mr. Wells being 2d with the same variety.

The best six Peaches were Grosse Mignonne, from Mr. Ashby; Mr. Best being 2d with Red Magdalen.

Mr. Cox, gr. to Mrs. Caledon Alexander, Calcot Park, Reading, had the best six Nectarines, staging Victoria; Mr. Howe being 2d, with Pine-apple.

Apricots were finely shown, Mr. Howe having the best.

Figs were equally good, Mr. Lockie being 1st. Mr. Goodman had the best three dishes of Plums, having Jefferson's, Washington, and Kirke's; Mr. Palmer, Thame, Ditton, being 2d.

Mr. Turton was 1st both with six dishes of dessert and culinary Apples; Mr. Paxton, gr. to the Hon. C. S. Irby, Taplow, being 2d with dessert, and Mr. Howe with culinary.

Mr. Richards had the best four dishes of Pears, Mr. Paxton being 2d.

The best four dishes of stewing Pears came from Mr. Turton, Mr. Paxton being 2d. A First-class Certificate of Merit was awarded to

Mr. Mortimer, Fareham, for twenty fruits of Sutton's Imperial green-flesh Melon, perfect in flavour.

VEGETABLES.

We can only allude to these briefly. Messrs. Sutton & Sons offered handsome special prizes for nine dishes of Potatos, Mr. Allen, the Gardens, Ramsbury, Hungerford, being 1st; Mr. Pope, High Clerc Gardecs, Newbury, 2d; and Mr. Elliott, Braycliffe Lodge, Maidenhead, 3d.

Mr. Allen had the best dish of Sutton's Seedling Potato, Mr. Elliott being 2d, and Mr. Wells 3d.

The best brace of Melons came from Mr. Lockie, who had Oakley Hill Seedling, a fine green-fleshed variety; Mr. Howe being 2d, with Blenheim Orange.

Mr. Waite, Esber, had the best collection of six kinds of vegetables, Mr. Kneller being 2d, and Mr. Richards 3d. The whole of the prizes in the foregoing classes were offered by Messrs. Sutton & Sons.

Messrs. Webb & Co., Stourbridge, offered special prizes for six collections of vegetables, Mr. Lye, the Gardens, Sydmonton Court, Newbury, being 1st, Mr. Kneller 2d, and Mr. Richards 3d.

Messrs. Carter & Co., Holborn, offered prizes for the best brace of Model Cucumbers, Mr. Lockie being 1st, and Mr. Jennings 2d. Also for the best brace of Blenheim Orange Melon, Mr. Lockie being again 1st, and Mr. Goodman 2d.

A First-class Certificate of Merit was awarded to Mr. E. Owen, Maidenhead, for an excellent strain of single and double Begonias.

HOUNSLOW HORTICULTURAL SOCIETY.

The first exhibition of this newly established Society took place on Wednesday, August 25, in the grounds attached to the Riding School, Whitton Dene, and great praise is due to the Society for the highly satisfactory issue attending this exhibition, the exhibits, which were of a miscellaneous and magnificent character, being tastefully arranged in several marquee—the collections of fruit and vegetables proving a continual source of interest.

A special feature in the show was a very fine non-competition group of hardy ornamental trees and shrubs contributed from Messrs. Charles Lee & Sons' arboratum, Isleworth, unique and graceful in its arrangement. Mr. Webb, their manager, may be said to have excelled himself on this occasion, this being one of the best groups he has put up this season.

STOKE-UPON-TRENT HORTICULTURAL.

THE 15th show of the above Society was held in the Recreation Ground, Stoke, on August 26, and was but poorly attended. Two Veitch Memorial Medals were offered on this occasion, the one for a group of foliage and flowering plants occupying 150 square feet, the other for a group of Orchids covering an area of 40 square feet; in addition to the medals a money prize of £5 was added to the first-named. There were only three competitors for these names, and only one of these figured at all respectably, namely, Mr. Roberts, gr. to A. Nicholson, Esq., of Stoke, who was awarded the Medal for a group containing some well-grown foliage and flowering plants, the other groups being very inferior. The Medal and £5, for a group of Orchids, was worthily awarded to Mr. Stevens, gr. to —Thompson, Esq., Walton, Stone, who showed a remarkably fine group for the season. The various plants were tastefully put up, consisting of fine forms of Odontoglossum Alexandrae and O. Pescatorei, Oncidium macranthum and O. crispum, Dendrobium Desrei, D. Jamesianum, several Masdevalliae and Cypripediums, and the lovely pure white Sobralia vernalis, bearing two good flowers; and various other Orchids. This was the only competitor for these prizes. The other classes were for plants, with the exception of that for the groups covering 50 square feet.

The miscellaneous stove and greenhouse plants were poorly represented, the 1st prize in each of these sections being easily secured by Mr. Roberts, of Highfield House, who generally shows well, the plants exhibited by him being good examples of cultivation.

CUT FLOWERS.

Roses were good for the time of year, but not so distinct as they ought to have been.

Thirty-six blooms (open).—Messrs. Sandy & Son, Stafford, were 1st, followed closely by Messrs. Perkins & Son, Coventry.

For twenty-four blooms (amateurs), Mr. Tillenius was 1st, and for twelve blooms Mr. Pyatt was 1st.

FRUIT.

Grapes were only fair. For three bunches, Elack Hamburgh, 1st, Mr. Wilkes, The Hayes, Stone, for good bunches; while Mr. Bola secured the premier

award for Muscats. Peaches and Nectarines were fair. Some nice collections of fruit were shown, Mr. Turner, gr. to B. Fitzherbert, Esq., being 1st; Mr. Myatt, gr. to W. E. Lewis, Esq., 2d; and Mr. Roberts, of Highfield, 3d.

VEGETABLES.

These were good all round, entries numerous, and competition strong. 1st, for collection, Mr. Turner, for a good lot, well put up; 2d and 3d, Mr. J. Wilkes and Mr. W. Stevens, in the order named.

AMATEURS AND COTTAGERS.

The exhibits by those who showed in the classes devoted to these were highly creditable, especially the vegetables, many examples being of first-class merit. A. O.

SANDY AND DISTRICT FLORAL AND HORTICULTURAL: August 27.

THIS was the eighteenth annual recurrence of one of the most popular exhibitions held in Bedfordshire, and it took place, as usual, in the park of Sandy Place, the residence of J. N. Foster, Esq. It is a remarkable show, because so all-embracing. The schedule of prizes includes so many subjects that have a special interest for country residents, that something like a dozen tents are required to accommodate all, and they are erected in the form of an immense ring, with the band, refreshment tents, &c., in the centre. In addition to plants, flowers, fruits, and vegetables prizes are offered for the special produce of market gardeners and farmers, the latter showing roots, white wheat in bushels, and ears of wheat, barley, and oats. Then there are prizes for honey, needle and ornamental work, stuffed animals, butter, eggs, trussed fowls, cage birds, poultry, pigeons, rabbits, &c. It is perhaps not to be wondered at that the country people attend this show in such large numbers, for there are local committees in all the surrounding villages. The acting secretary is Mr. William Green, who has filled this office for several years past, and who works very hard to make the annual exhibition a success.

PLANTS.

The plant tent is the leading feature of the Sandy show. On this occasion there were five collections of ten stove and greenhouse plants in flower competing for the handsome prizes in the division open to all. The 1st fell to the lot of Mr. W. French, gr. to J. J. Marriott, Esq., Cambridge, who had a nice fresh lot of plants, the leading ones being *Allamanda nobilis* and *A. Hendersoni*, a fine *Lapageria rosea*, *Isora javanica*, *Borhania*, and *L. amabilis*, *Stephanotis floribunda*, *Diplolena amabilis*, *Bougainvillea glabra*, &c. 2d, Mr. J. Cypher, nurseryman, Cheltenham, who had a fine *Phloxocoma proflera* Barnesi, and the splendid *Isora Duffii* that made such a sensation in the West of England, but in the company of others of a stala character, which detracted from their value; a good *Erica Aitoniana* Turnbulli, &c. Mr. J. F. Mould, nurseryman, Pewsey, was 3d.

Mr. G. Kedman, gr. to J. H. Goodgates, Esq., Eynesbury, St. Neots, was 1st with six foliage plants, Mr. G. Clayton, gr. to J. Astell, Esq., Woodbury Hill, Sandy, being 2d; in both cases rather small in size, but fresh and well grown.

Mr. Clayton had the best six stove and greenhouse Ferns, stating fine examples of the following *Adiantum*:—*Farleyense*, *cuneatum*, *gracillimum*, and *concinnum*; *Gymnogramma chrysophylla*, and *Blechnum covardense*; 2d, name not given, but with five well grown *Adiantum* and *Heterocnemis alicecorne*. *Fuchsia* were shown, so were *Coleus*: all fresh and nicely grown; and there were some capital tuberous-rooted *Begonias*, Mr. W. Apthorpe, Cambridge, being 1st, with a very good lot; Mr. Brown, of Cambridge, being 2d.

Zonal *Pelargoniums* in 12's and also in 6's, and nosegay and variegated, also in 6's, were all good, and made an excellent display. *Achimenes* were very nice also. In fact, the quality and varieties of the plants shown deserve a fuller report than we are able to give them.

CUT FLOWERS.

These were one of the showy points of an exhibition good in all its parts. In the open-to-all class for forty-eight cut Roses Messrs. Paul & Son, Old Nurseries, Cheshunt, were 1st, with a remarkably good lot for the season of the year, the best varieties being *Jan Ducher*, A. K. Williams, *Comtesse de Nadailac*, *Madame Berard*, *La France*, *Maréchal Niel*, *Ulrich's Brunner*, *Pierre Notting*, *Star of Waltham*, *Ella Gordon*, and *Marie Baumann*; 2d, Messrs. J. Burrell & Co., Howe Hill Nurseries, Cambridge.

Mr. B. Lindley, Esq., Hitchin, had the best twenty-four varieties, a fairly good lot; the Rev. Dr. King, Mately, Cambridge, being 2d.

A splendid lot of twenty four spikes of *Gladoli* was shown by Messrs. J. Burrell & Co., remarkable for the massiveness of the flowers and high quality of

the varieties; by Mr. E. T. Atherton, Cambridge, was 2d.

Mr. Henry Glasscock, Bishops Stortford, a well-known Hertfordshire amateur, was 1st, with an excellent lot of twenty-four Dahlias, including fine blooms of *William Rawlings*, F. J. Salmarsch, *Harry Turner Joseph Ashby*, *Flag of Truce*, Mrs. W. Slack, *Shirley Hiltbert*, Mrs. Gladstone, *James Cocker*, *Ilon W. P. Wyndham*, Mr. G. Harris, *Countess of Ravensworth*, *James Service*, *Miss Cannell*, Mrs. Douglas, *Ethel Britton*, *John Henshaw*, *Joseph Green*, *Acme of Perfection*, &c. 2d, Mr. W. Peterfield, gr. to A. J. Thornhill, Esq., Diddington, Huntingdon.

Mr. W. Apthorpe had the best twelve show varieties; the Rev. E. L. Fellowes, *Wimpole Rectory*, *Koyston*, being 2d.

Mr. Glasscock had the best six fancy varieties, having good blooms of *Wizard*, *Professor Fawcett*, *Flora Wyatt*, *Mandarin*, *Duchess of Albany*, and *Miss Browning*; 2d, Mr. Petfield.

Single Dahlias being shown as single blooms made but an indifferent display.

Mr. W. French had the best lot of twelve cut flowers, showing a capital lot; Mr. Kedman being 2d.

Outdoor flowers in bunches of twelve were a striking feature, but the stands were in almost every case too small to show them off with advantage. *African Marigolds* were of very fine quality, and the French varieties were much finer than are usually seen. All the classes of *Asters* were good. *Pentstemons* and *Phloxes* very good.

FRUIT.

There was a very good show of fruit, and especially of the hardy varieties. The best collection of eight dishes came from Mr. Tilbrook, gr. to E. Brown, Esq., St. Neots, who had black Hamburg and Muscat of Alexandria Grapes; Lord Napier, *Nectarine*, *Apple Park*, *Apricots*, *Jefferson Plums*, *Melcon*, and *Kerry Pippin Apples*; 2d, Mr. R. Aldis, Old Warden Park.

Mr. W. Murfin, Great Haughton, had the best six dishes.

Mr. G. Warbury, gr. to Mrs. Medland, St. Neots, had the best two bunches of Black Hamburg Grapes; the name of the 2d prize winner was not given.

Mr. Jos. Topham, the Gardens, Thorney Park, Peterborough, had the best two bunches of any other black, staging *Gros Maroc*, and the same variety was 2d; name of exhibitor not given.

Mr. G. D. White, gr. to Captain Stanley, Longstone Hill, Cambridge, had the best two bunches of Muscat of Alexandria Grapes.

Mr. G. R. Abis had the best two bunches of any other white, staging *Buckland Sweetwater*; Mr. Petfield being 2d with *Golden Champion*.

Pears and Nectarines were good for outdoor-grown fruit.

Plums were largely shown: the leading dessert sorts were *Green Gage*, *Jefferson's*, *Transparent Gage*, and *Prince Englebert*. The leading culinary varieties were *Diamond*, *Victoria*, and *Yellow Magnum Bonum*.

Dessert Apples were good, the leading ones *Red Astrachan*, *Irish Peach*, and *Juneating*.

Kitchen Apples were very fine indeed; the best *Lord Derby*, *Lord Suffolk*, and *Hawthornden*. The best dessert Pears were *Bon Chrétien*, *Jargonelle*, and *Windsor*.

Morello Cherries were both numerous and fine; so were red, black, and white Currants. But it would occupy a great space to give details of the competitions in these classes.

VEGETABLES.

These were an astonishing feature—so numerous and fine, but the show was taking place in the midst of one of the great market gardening districts of England. The best collection of twelve varieties came from Mr. H. Bourne, Huntingdon Road, Cambridge, who had *Cauliflower*, *Globe Artichokes*, *Potatoes*, *Celery*, *Peas*, *Scarlet Runners*, *Tomatoes*, *Cucumbers*, &c.; 2d, Mr. C. Ellis, Bedford.

Mr. W. Ridgewell, Cambridge, had the best collection of six varieties.

The best collection of six dishes of Potatoes came from Mr. H. Ridgewell, who had *Glastone*, white round; *Adirondack* and *Vicar of Laleham*, *Chancellor*, *Beauty of Hebron*, and Mr. Bresse. 2d, the Rev. J. D. Itawkesey, The Chaplains, Baldock, having *Lady Tussock*, *Queen of the Valley*, *Reading Russet*, *Victor*, *Salmon Kidney*, and *International*. All other vegetables were numerous and of the best quality.

The display of produce by market gardeners and farmers, by housewives and children, was all of a very interesting character, and it is satisfactory to know there was a large attendance of visitors.

Mr. T. S. Ware, Tottenham, staged, not for competition, five boxes of cut Dahlias, single, pompon, and Cactus types—a very fine lot indeed, the single flowers including a few that were new, and of excellent quality. This contribution was very highly commended.

RYDE HORTICULTURAL.

THE second horticultural show (confined to growers in the Isle of Wight), under the auspices of the Ryde Sports and Amusements Association, was held in the beautiful grounds of the Isle of Wight College, on Thursday, August 29, and was even more successful than last year, the open classes attracted exhibitors from all parts of the island, and the result was an excellent and varied show, and a good attendance of visitors. A charming day enabled the visitors thoroughly to enjoy the floral beauties in the tents, and the walks in the beautiful grounds, which are kept in excellent order. The show was opened by the Mayor, Alderman Barron, who was supported by Professor Simonds, the chairman of the committee, J. O. Brook, Esq., W. Gibbs, Esq., and the popular secretary, Mr. J. Eley.

Tent No. 1 contained the flowers, open to the island. A most striking feature here was the various collections of six splendid baskets of cut flowers, which have not been equalled at any show this season, the competition being a very close one.

The prizes were awarded to Mr. Rayner, Grove House, Shanklin, 1st; Mr. J. Attrill, 2d; Mr. H. Butcher and Mr. H. Tolly, equal 3d.

Gladoli were well shown: Mr. Attrill was 1st, Mr. G. Spragg 2d.

Two Dahlias very good, Mr. W. Matthews, 1st; Mr. J. Flux, 2d; Mr. J. Tilden, 3d. Single Dahlias formed a pretty show: Mr. H. Butcher, 1st; Mr. J. Flux, 2d.

The cut Roses were rather below average—Mr. E. Williams, nurseryman, Ryde, 1st; Mr. E. Park, 2d; *Zinnias* and *Marigolds* very good.

Hand bouquets were very pretty, and in good taste. Mr. Banting, florist, Shanklin, 1st; Mr. E. Brading, 2d; Miss Cue, 3d.

Zonal *Pelargoniums*, twenty-four distinct, were shown well by Mr. James, florist, Ryde, who was 1st.

Tent No. 2 was devoted to specimen plants and groups, table plants, *Ferax*, &c., *Begonias*, *Balsams*, *Cockscombs*, *Coleus*, *Lilies*, *zonal Pelargoniums*, &c.—Mr. James carrying off the 1st prize, a special prize for the group, presented by Professor Simonds.

Tent No. 3 was devoted to fruit and vegetables, Mr. J. Mair being the principal prize-taker in fruit, and Mr. Bouchon, *Eximius* Barrow, in vegetables.

Special prizes, presented by Mrs. Gibbs, for three lady's sprays—Mr. J. Dale, 1st; Mr. J. Banting, 2d. Special prize, model garden, B. Barron, Esq., 1st; Mr. G. Spragg, 2d; Mr. J. Burt and Mr. C. Price, equal 3d.

Messrs. W. & G. Drover, florists, Farcham, exhibited some splendid bouquets and lady's sprays, not for competition. Correspondent.

SEEDS.

LONDON: September 1.—Messrs. John Shaw & Sons, seed merchants, of 37, Mark Lane, E.C., write that in the continued absence of rain the sowing demand for seeds is naturally small. As regards values no important change can be noted. Samples of new foreign Ashle and red Clover seed are now showing, but no business has yet resulted. New Mustard is also offering. For winter Tares less money is taken. Bird seeds are firm. Fine new blue Peas command full prices. New Rape seed is exceedingly cheap.

CORN.

MARK LANE: Aug. 30.—The weather continues all that could be desired for the harvest, and reaping makes rapid progress. The quality of the Wheats at hand has been cut varies a good deal, but the condition is perceptibly improving, from the continued brilliant weather. Samples of new Wheat were shown to-day of a mixed character. The sales made were chiefly at 30s. to 33s. for red, and 32s. to 35s. for white, but some of the better samples were held 1s. above these rates. Old Wheats were 1s. lower on the week to sell. Foreign Wheat was virtually neglected, and although there were sellers at 6d. and 1s. reduction, scarcely anything was done. Flour ruled generally 6d. per sack lower, with a very limited demand. Grinding Barley fully supported late value, though the trade was quiet. Beans and Peas were also firm. Common Oats, of which the supplies are large, tended in buyers' favour. Fine qualities upheld their value.

Sept. 2.—English Wheat met but few bids, and these were at reduced rates, whilst sellers of foreign were willing to accept easier prices, but found opportunity of doing so only upon a very small scale. About the same remarks will apply to flour. For Barley the market was barely so steady, but good malting kinds were firm. Beans and Peas maintain late value. Oats tended in buyers' favour.

Average prices of corn for the week ending August 28:—Wheat, 33s. 6d.; Barley, 24s. 6d.; Oats, 21s. 6d. For the corresponding period last year:—Wheat, 33s. 3d.; Barley, 28s. 4d.; Oats, 20s. 6d.

FRUITS AND VEGETABLES.

COLUMBIA (East London): Sept. 1.—Good supplies. Trade fair, prices moderate. Quotations:—Apples, 3s. to 6s. per bushel; Pears, 2s. 6d. to 5s. 6d. doz.; Black Plums, 1s. 3d. to 2s. 3d. doz.; Orleans do., 1s. 6d. to 2s. 6d. doz.; Egg do., 1s. to 1s. 6d. doz.; Scarlet Beans, 1s. to 1s. 6d. per sieve; French do., 1s. 6d. to 2s. doz.; Vegetable Marrows, 1s. 6d. to 2s. 6d. per tally; Cabbages, 3s. to 4s. doz.; Carrots, 1s. 6d. to 2s. per dozen bunches; Turnips, 1s. 6d. to 2s. doz.; Onions, 2s. to 2s. 6d. doz.; Sage, 1s. 6d. to 2s. doz.; Parsley, 1s. 6d. to 2s. doz.

STRATFORD: August 31.—Supplies have been good, and a fair trade has been done at the following prices:—Cabbages, 2s. 6d. per tally; Cauliflowers, 1s. to 1s. 6d. per dozen; Turnip do., 1s. 6d. to 2s. per dozen bunches; Carrots, household, 1s. to 1s. 6d. doz.; Apples, 2s. 6d. to 3s. 6d. per bushel; Watercress, 6d. per dozen; Pears, Williams, 4s. 6d. to 5s. per bushel; Cucumbers, 6d. to 9d. per dozen; Plums, 2s. 6d. to 3s. per bushel; Tomatoes, 1s. 3d. to 1s. 6d. per dozen; Marrows, 1s. to 1s. 3d. per dozen.

POTATOS.

BOROUGH AND SPITALFIELDS: Aug. 31.—The trade continues to move very slowly, and prices are without improvement. Quotations:—Magnum Bonnum, 60s. to 70s.; Kent Regents, 60s. to 80s.; Hebrons, 70s. to 80s.; Essex Shaws, 60s. to 70s.; Early Roses, 50s. to 70s.; and Jersey kidneys, 80s. to 100s. per ton.

COLUMBIA (East London): Sept. 1.—Quotations:—Magnums, 50s. to 65s.; Regents, 60s. to 65s.; Victorias, 50s. to 60s.; and Beauty of Hebron, 55s. to 60s. per ton.

STRATFORD: Aug. 31.—Quotations:—Roses, 55s. to 60s.; Regents, 55s. to 60s.; Magnums, 60s. to 65s.; and Beauty of Hebron, 60s. to 65s. per ton.

Imports.—The imports into London last week consisted of 46 tons 43 bags from Earleer.

HAY.

WHITECHAPEL: Aug. 31.—Trade dull, with good supplies. Prices:—Clover, 90s. to 108s.; inferior, 70s. to 85s.; hay, prime, 70s. to 92s.; inferior, 45s. to 65s. Straw, 26s. to 37s. per load.

Sept. 2.—A large supply was on offer. The trade was dull, at previous prices.

STRATFORD: Aug. 31.—Quotations:—Hay, 80s. to 100s.; Clover, 90s. to 100s.; and straw, 30s. to 35s. per load.

Government Stock.—Consols closed on Monday at 104½ to 101 for delivery, and 101½ to 101¼ for the account. Tuesday's closing prices were 101½ to 101¼ for delivery, and as on the previous day for the account. The final quotations of Wednesday were 100½ to 101 for delivery, and 101½ to 101¼ for the account. Thursday's closing prices were 100½ to 101 for delivery, and 100½ to 101¼ for the account.

Oil Paint no Longer Necessary. HILL and SMITH'S BLACK VARNISH, for Preserving Ironwork, Wood, or Stone.

This VARNISH is an excellent substitute for oil paint or any outdoor work, while it is constantly increasing sale. It was introduced upwards of forty years ago by the Advertisers, and its genuine good quality, notwithstanding a host of unprincipled imitations, is fully attested by its constantly increasing sale. It may be applied by an ordinary labourer, requiring no mixing or thinning, and is used cold. It is used in the grounds at Windsor Castle, Kew Gardens, and at the seats of most of the Nobility and Gentry, from whom the most flattering testimonials have been received. Sold in Casks of about 30 gallons each, at 1s. 6d. per gallon, at the Manufactory, or 1s. 8d. per gallon carriage paid to any Station in the Kingdom.

UNSOLICITED TESTIMONIAL. From ALFRED LOWE, Esq., The Rytons, Alderley Lodge. "Some twenty years ago I used your Black Varnish, and shall be glad if you will forward me a cask, as I consider it the best thing known for the preservation of all outdoor work, either wood or iron, that requires to be painted. My customers are highly pleased with it, and must continually warn their Customers against the various cheap Varnishes now so much advertised. Every cask is legibly marked with their name and Registered Trade Mark as above, without which none is genuine. Large Illustrated CATALOGUE on Fencing, Hurdles, Field and Entrance Gates, &c., sent free on application to—

HILL & SMITH, Brierly Hill Ironworks, near Dudley; 118, Queen Victoria Street, London, E.C.; and 135, Stephen's Green, Dublin.

HOLLOWAY'S PILLS are strongly recommended to all persons who are much reduced in power and condition, whose stomachs are weak, and whose nerves are shattered. The beneficial effects of these Pills will be perceptible after a few days' use, though a more extended course may be required to re-establish perfect health. Holloway's medicine acts on the organs of digestion, and induces complete regularity in the stomach, liver, pancreas, and kidneys. This treatment is both safe and certain in result, and is thoroughly consistent with observation, experience, and common sense. The purification of the blood, the removal of all noxious matter from the secretions, and the excitement of gentle action in the bowels, are the sources of the curative powers of Holloway's Pills.

SPECIAL NOTICE

B. S. WILLIAMS

Has this year been favoured with the Orders for the whole of the BULBS required for the following London Parks, &c., viz.:-

- HYDE PARK. ROBERT'S PARK. VICTORIA PARK. BATTERSEA PARK. KENNINGTON PARK. BETHNAL GREEN MUSEUM. HAMPTON COURT. FINCHURCH PARK. SOUTHWARK PARK. VICTORIA EMBANKMENT. LEICESTER SQUARE. CHILSEA EMBANKMENT.

His Tender, in open competition, having been accepted by Her Majesty's Commissioners of Works and the Metropolitan Board of Works.

EARLY ORDERS ARE SOLICITED FOR HYACINTHS for Pots and Beds.

- TULIPS. NARCISSI. CROCUS. ANEMONES. RANUNCULUS. FREESIAS. LILLIUMS. SNOWDROPS, &c., &c.

The quality of the Bulbs is unusually fine this year.

Special quotations will be given for large quantities on application.

Illustrated Bulb Catalogue is Now Ready, and will be forwarded, Gratis and Post-free, to all applicants.

VICTORIA and PARADISE NURSERIES, UPPER HOLLOWAY, LONDON, N.

A. B. C. BULB GUIDE.

Prepared with very much care, containing much reliable information upon Bulbs generally, including the following families:-

- HYACINTHS, TULIPS, CROCUS, SNOWDROPS, CHIONODOXAS, GLADIOLUS, &c.

Very extensive lists of varieties of these are included, consisting of nearly every variety which can be considered worth growing.

IRIS - Of these I hold one of the finest collections in the world, six pages are devoted to this family alone.

HELLEBORES, or CHRISTMAS ROSES are a great specialty at Tottenham. The collection is very complete, and the plants are exceptionally good.

DAFFODILS and LILIES

constitute Part II. of my Bulb Catalogue, Twenty-six pages being devoted to them.

Both families are cultivated by me most extensively, my collection including almost every variety in cultivation. These have been shown most extensively during the present season at the Great London Show, and have been very much admired.

Copies of this most complete and interesting Catalogue may be had gratuitously upon application to

THOMAS S. WARE, HALE FARM NURSERIES, TOTTENHAM, LONDON.

FERNS A SPECIALTY.

An IMMENSE STOCK, in SPLENDID CONDITION. ILLUSTRATED CATALOGUE, containing "Hints on Fern Cultivation," 12.

SMALLER CATALOGUE, of over 1300 species and varieties, including Descriptive "LIST of New, Rare, and CHOICE FERNS," and "HARDY NORTH AMERICAN FERNS," free of application.

W. & J. BIRKENHEAD, FERN NURSERY, SALE, MANCHESTER.

CHEAP, STRONG, SOUND BULBS.

- ROMAN HYACINTHS, extra strong, 12s. 6d. per 100. NARCISSUS, extra strong, 9s. per 100. PAPER WHITE NARCISSUS, extra strong, 9s. per 100. FINE NAMED HYACINTHS, for pots, in sorts, 5s. per doz. CRUCIUS, in sorts, 2s. per 100. CATALOGUES free on application. Special Prices for Large Quantities. FINE TOBACCO PAPER and CLOTH, 12. per pound. JOHN SHAW, Junr., Bulb Importer and Seed Merchant, 10, The Downs, Bowdon, Cheshire.

Orchids. J. ROBSON, Bowdon Nursery, Altrincham, Cheshire, having purchased Two Private Collections of Established ORCHIDS, is prepared to supply strong flowering plants at the following very low prices for cash:- 12 ORCHIDS, in 12 choice varieties, 6os. 12 ditto, 10s. List of sorts on application. J.R. is also offering the following Plants, at extraordinary low prices, viz.:- CARNATIONS, in 25 best varieties, 3os. per 100; DIANTHUS, Napoleon III., 2os. per 100; FLOTTIES, in 25 best varieties, 2s. 6d. per 100; PYRTHRUMS, in 25 best varied varieties, 2os. per 100; PELLARGONIUMS, in 25 best varieties, 4os. per 100; Manchester Market and Dromhead CABBAGE PLANTS, 3s. per 100 for cash.

W. GORDON, IMPORTER OF ORCHIDS FROM ALL PARTS OF THE WORLD. An IMMENSE STOCK of recently imported and a SALE of the Established Plants to make room. These have not yet flowered, but are all flowering plants, and must be sold at a great sacrifice. VERY VALUABLE VARIETIES are certainly to be obtained, and great bargains; see Public Journals for high prices recently obtained. THE SPECIAL OFFER affords a FAYING INVESTMENT to any one with glass at command, which should not be overlooked. SUCH PLANTS may never again be offered to the PUBLIC and the TRADE. Apply to W. GORDON, The Nurseries, Amand Park Road, Fawcett Hill, Middlesex.

THE

Gardeners' Chronicle.

SATURDAY, SEPTEMBER 11, 1886.

DROP MORE.

IT is always a pleasure to visit Dropmore, and, after an interval of several years I was glad once more to inspect its great Conifers and to incite their guardian, Mr. Frost, who seems as evergreen and sturdy as any of them, to tell his old stories and to fight his old battles over again. See Dropmore, if you can, in its glory about June 1, when the Rhododendrons are in bloom. My recent visit fell two months later on a hot day of mixed sunshine and cloud, when the atmosphere was softened by an occasional shower which evaporated quickly in the shrubberies, and increased the foreign aspect imparted by the Conifers to the spot where they are now assembled and where they appear, almost without exception, thoroughly at home.

A small point in regard to treatment in the young days of an exotic Conifer may make or mar its fortune. How often one may see specimens that deserved good management and the timely pruning knife, or the application of the axe to some over-crowding neighbour, or a little fresh soil for its subsistence, ruined for want of necessary care! But Mr. Frost knows the needs of each, and has taken care to supply them during the lengthened period of his superintendence. The great *Araucaria imbricata* was described ten years ago as 60 feet in height and 45 years old. It has grown about a foot in each subsequent year, and stands now a perfect pyramid of nearly 70 feet from the base to the apex, its branches resting on the ground. At a distance of 12 feet or 15 feet from the trunk on the south side the ground slopes off towards an adjacent pond, and this would probably have occasioned a lopsided growth, as the tree was planted in made earth of unequal depth, owing to the slope, it Mr. Frost had not come to the rescue and levelled the slope partially with many barrow-loads of fresh soil. But the better the soil the thicker the branches. A Lime tree on rich soil becomes as bushy as a magpie's nest, and the big pet of Dropmore, since the extra feeding has developed a number of spiny twigs on the trunk, particularly on its southern side. It is a male tree, and the shrivelled catkins showed brown towards its top.

The *Abies Douglasi* here of more than 120 feet in height is another pet of the pinetum, and its pride. It has offspring around it, especially a tree of 1835 growing by the carriage-drive, a cutting from the original tree, and laden with heavy branches bearing many cones. The original tree carries us back to the days of Mr. Frost's honoured master, Lord Grenville, the founder of Dropmore, and the encloser of the roughs and wastes which he supplanted by the present grounds 600 acres in extent. Lord Grenville, being a Fellow of the Horticultural Society, sent to Dropmore some of the seed which the Society had received from Mr. Douglas. It was sown in 1827, and the big tree was planted in 1830.

A *Pinus insignis* of 1839 stands here 75 feet high and well protected among other exotics, a handsome, big fellow, in grass-green livery. The trunk is covered with red spongy bark river into vertical cracks. I omitted to take notes of the broad-spreading *Abies cephalonica*, or of *A. pinsapo*, with its thickest leaves, but I find from Messrs. Veitch's *Manual of Conifers* that these two trees were introduced from Cephalonia and the South of Spain respectively in 1824 and 1839. They must have reached Dropmore betimes, for their growth seems to have reached 50 feet or 60 feet in the first case, and 60 feet or 70 feet in the second, which is not far short of their reputed natural growth. I noted *Pinus Lemniana* of 1839 as a tree of no beauty, with rough bark, few lower branches, and long leaves. On the other hand, *Abies grandis*, 70 feet high, and dated 1861, forms a noble pyramid now showing cones near the top, and with tier upon tier of flat rhomboidal branches. It was thirty years reaching Dropmore; *Abies Albertiana* was here within ten years of its introduction, bearing the date of 1861, and the name of the Prince Consort, the patron of the Scotch Association, who imported it from the north-west coast of America, in 1851. It is closely allied to that graceful tree, the Hemlock Spruce, with its pendulous branches and ample foliage, and the perfect specimen at Dropmore, though by no means the rarest, is one of the most beautiful trees in the grounds, having much of the graceful habit of the Deodar. *Cedrus atlantica* of 1847, and 70 to 80 feet high, is another very handsome tree which came here, as the above date shows, in the seventh year of its introduction. The magnificent *C. Deodara* is nearly 70 feet high. *Sequoia gigantea* (the Wellingtonia), introduced by Messrs. Veitch in 1853, through their collector Mr. William Lobb, is dated here 1862, measures 65 feet, and is a tall, pointed pyramid, fortunately full of foliage, and therefore looking its best, for when the foliage is scanty it is a rigid plain-looking tree.

The best *Sequoia sempervirens* in the pinetum stands 80 feet high, and droops its heavy foliage on the ground; and as pheasants crowd around I could imagine a hare sitting in the sunny shelter of this tree. I missed the best deciduous Cypress, but saw, among other Conifers too numerous to name, *A. morinda*, 55 feet high, with branchlets drooping from the main branches, and festoons of Woodbine hanging high from the tall trunk; I also noted during our tour of inspection *Pinus excelsa*, *P. pyrenaica*, *Abies concolor*, 1862, foliage in handsome flakes; *Pinus Benthamiana*, 1843, 70 feet, with very bushy long foliage; and *Abies Bruniana*, 1847, the Himalayan Hemlock Fir from Nepal, together with grand examples of *Thuja gigantea* from Oregon.

A noble Birch is also worthy of inspection. It is an old tree whose short trunk divides at a little distance above the soil into three spreading much contorted arms, from which diverge forests of young twigs. In size, as in habit, this tree is very remarkable. Heaths of various kinds abound, the introduced ones now as much at home as the real natives, and the same remark applies equally well to the common Musk, *Mimulus moschatum*, which looks as much a native as the grass amid which it grows.

The bedding-out system is still carried out here in what we may now call old-fashioned style, and it is supplemented by a large collection of still older fashioned herbaceous plants, full of variety, redolent of perfume, and particularly coloured as a mosaic. A still greater blaze of colour is to be seen in the Pelargonium-house.

Those who know Dropmore may like to be reminded of the long avenue of Cedars of Lebanon; and gardeners may like to hear of the silver cup and 200 sovereigns, invested as an annuity, which his horticultural friends

in all parts of the country presented to Mr. Frost in 1872, to commemorate fifty years' public and private service as a gardener of worth and note. I must add, in regard to the ownership of this noted place, that 'tis as 'twas"—Lady Louisa Fortescue still reigns. The number of gardeners is now only twelve. A bit of clay ground which the veteran gardener has turned topsy-turvy and chalked heavily, and finally induced to yield extraordinary crops, deserves a separate article. It is now a most productive kitchen garden, which may serve to assure us how excellent the effect of Frost is upon clays with double digging and free exposure. *H. E.*

It may be serviceable to append in this place a list, showing the height to which some of the more remarkable trees had attained in the spring of this year (1886):—

- Cedrus Libani*, planted in 1779, height 100 feet, girth at 3 feet, 15 ft. 1. In the long avenue above referred to, the trees average 80 feet in height, with a girth from 8 to 10 feet.
 „ *deodara*, 65 feet in height, with a girth of 6 feet.
 „ *atlantica*, planted in 1847; 70 feet high, bearing cones, a splendid tree.
Abies Douglasi, planted in 1839, height 124 feet, girth 15 feet; spread of branches, 22 yards. Another planted in 1865, height 90 feet, girth 3 feet 4 inches.
 „ *grandis*, planted in 1861, height 70 feet, a splendid tree.
 „ *amblya*, planted in 1847, height 30 feet, girth 6 feet.
 „ *nobilis*, planted in 1845, height 80 feet; branches down to ground.
Pinus macrocarpa, fifty-one years old.
 „ *Lemniana*, planted in 1839.
 „ *insignis*, planted in 1839, girth 12 feet.
Sequoia gigantea, planted in 1862, height 70 feet, girth 11½ feet.
Anacardium imbricatum (Chili Pine). There are many of these, the largest, planted in 1839, having a height of 63 feet, girth 8 feet 2 inches.
Taxodium sempervirens, 80 feet in height.

New Garden Plants.

CYRIPEDIUM CALLOSUM, n. sp.*

THIS was imported from Slam by Mons. Regnier, Fontenay-sur-Bois, 49, Avenue de Marigny. It looks like *Cypripedium Argus*, with nearly green leaves, and curious pendulous petals. The peduncle is very long, as in *Cypripedium Argus*. The upper sepal is very large, transversely elliptic-acute, with very numerous green nerves, and some purple wash on a white ground. The lateral sepals form a small ligulate, acute, few-nerved body, half as long as the lip, and quite hidden by it. Petals ligulate, blunt, acute, quite deflexed, so much so that the two nearly touch one another on their inner sides, green, purple at the top, ciliated, with several, conical, shining, black papular warts on the margins, and thick ones on the disc, partly also papular. This is new. The lip is like that of *Cypripedium superbiens*. Staminode reddish, with some green marbling on the anterior part of the disc, emarginate, bilobed at the top, forcipate in front, with a small dark apiculus in the middle. *H. G. Rehb. f.*

ONCIDIUM POLLETTIANUM, n. sp. (Hyb. nat. 5).†

A remarkably fine and exceedingly rare Oncidium, most probably a hybrid, though I know well that it has been recently stated that *Oncidia* produce very seldom and but a few capsules. I should value such

* *Cypripedium callosum*, n. sp.—(Venusta deflexa) foliis coracens viridibus obscurissime tessellatis; pedunculo elongato; bractea acuta ovarium pedicellatum longe non sequenti; sepalis impari elliptico acuto transverse multivertice; sepalis lateralibus in corpus triangulum coactis labelli dimidium vix æquans; tepalis omnino deflexis exatibus ciliatis callis concis quibusdam in margine calli. paucis incrassatis in disco; labello marginis unguiculari utrinque obtusangulo ovato superne utrinque angulato; staminodi coracibus auriculis forcipatis, processa mediana minuto acuto papuloso. Ex Slam introd. Regnier vivamque plantam misit. *H. G. Rehb. f.*

† *Oncidium Pollettianum*, n. sp. (hyb. nat. 5).—Pseudobulbis foliisque *Oncidii* dasythylis cui viciniorum; racemo plurifloro; floribus illis *Oncidii* Gardneri æquiantheris, sepalis lateralibus apicem usque bidentatum connatis; sepalis oblongis ciliatis; labellis auriculis obtusis mucosis, isthmo linearis, lamina antera transversa obtusangula quadriloba, lobis mediis parvis, calli in basi subquadrate lobato antepositi carinis longis teretibus, carina utroque basi exterrimis unidentata antice clavata, callis lobulatis, uno utrinque status ad apicem, calli basilaris; columnæ hucusque aliis rotundatis. *H. G. Rehb. f.*

remarks were they the result of long observations during many years. If a New Zealander saw with us hundreds of thousands of trees of *Fagus sylvatica* without fruits, and declared they produced nearly none, what should we say? There are, however, fruits of *Oncidia*. Thus I have before me what must be *Oncidium Lawrenceianum* as first collected by Professor Suringar. The group of altilissimum is often seed bearing; echinatum is very often fertile, and why should there not be a hybrid? This may be a male between *Oncidium dasyle* and perhaps *Oncidium Gardneri*. The connate side sepals are bidentate, the upper sepal oblong acute, the petals cuneate, obovate, blunt. Lip with very small rounded auricles at the base, a long narrow isthmus and a wide transverse quadrilobed blade with two small inner and two broad outer lobes. The column is short, with two fleshy ovate wings. The calli are long, running from the base over the isthmus, dark brown-purple. The column is of the lightest whitish-yellow; wings spotted with purple on a light whitish-yellow ground. Petals, horse-chestnut brown with a narrow yellow border; sepals yellow with horse-chestnut bands.

It comes from Mr. H. M. Pollett, Fernside, Bickley, and was kindly sent me by Mr. Harry Veitch. Mr. H. M. Pollett states that the bulbs and leaves are exactly those of *Oncidium dasyle*, say a trifle larger. The inflorescence is stated to be a simple raceme. It duly bears Mr. Pollett's name. *H. G. Rehb. f.*

MILTONIA PEETERSIANA, n. Hyb. nat. 7

THIS has the bulb and leaf of *Miltonia Clowesii*. The peduncle is very strong, not markedly two-edged but more rounded. The shading of the inflorescence is rather flexuous in one specimen, with ancipitous triangular large bracts, nearly equal to the stalked ovaries. The flowers would be difficult to distinguish from those of *Miltonia spectabilis* Morelana, but the lip is narrower at the top. Both the sepals and petals are a little narrower and more acute, of the finest dark horse chestnut-purple (s. v. v.). The lip is of the richest purple, with five unequal yellow keels at the base, and numerous dark purple blotches with nearly white margins occupy the base, and inside line of the disk. The auricles of the column are bilobed. The yellow tabula infrastigmatica is provided with two erect teeth. It is probably a hybrid between *Miltonia spectabilis* Morelana and *M. Clowesii*. I received five flowers, an inflorescence, bulb, and leaf from Mr. A. A. Peeters, horticulteur, St. Gilles, Bruxelles, to whom it is dedicated with pleasure. I believe I saw the very same plant at Mr. W. Bull's some days ago, when it was nearly dark. *H. G. Rehb. f.*

CATTLEYA GUTTATA LEOPOLDI IMMACULATA, n. var.

THIS fine sub-variety has both the sepals and petals of a mauve-bronze colour, and there is no vestige of any spots. The lip is white, the anterior lacinia of the finest purple. Column purple. It was kindly sent me by Mr. A. A. Peeters, horticulteur, St. Gilles, Bruxelles. *H. G. Rehb. f.*

FRUIT NOTES.

BIGARREAU LEONA QUESNEL.

A CHERRY with fruit nearly 1 inch in diameter, rounded, with scarcely any furrow, skin yellow flushed with red, flesh white, juicy. The tree is fertile, of pyramidal habit. This variety was raised by Mr. Tyman, and is highly spoken of by the editor of the *Bulletin d'Arboriculture* for August.

APPLE BEAUTY OF BATH.

I can scarcely think this Apple is known as widely as it deserves to be. I have seen it on several occasions in excellent form this season, particularly at the Taunton and Trowbridge shows; at the latter place, where dessert Apples are shown in excellent form, Beauty of Bath was conspicuous for its handsome and pleasing appearance. Mr. George Cooling, of Bath, who distributed it, states that it is a seedling from the Juneating, and originated some twenty years ago in the neighbourhood of Bath. It is of medium size, and extremely handsome in appearance, being beauti-

fully striped with crimson towards the sun. It ripens early in July in a good season, and can be had in a late one up to the third week in August. In flavour it appears to surpass in briskness and piquancy the Irish Peach and Juneating. It can, therefore, be classed as a first early dessert Apple, and it frequently takes 1st prizes at the West of England show. To show its prolificacy, Mr. Cooling states that two years ago he planted out 200 three-year old trees, and has taken a great crop from them this season; and from eight small trees he gathered as many as 18 pecks. It is found to come in very useful as a side dish in a dessert at a time when Strawberries are over. On p. 168 of the *Report of the Apple Congress* it is stated to resemble Small's Admirable. It is obvious that something other than the true sort was shown at the Apple Congress under the name of Beauty of Bath, as it will not keep beyond August; and Mr. Cooling further states it is entirely distinct in character. *A. D.*

THE HISTORY OF PLANTS.*

The literature of science is of little, if any, value in tracing the history of species, and in determining the modification or the persistency of characters which may be essential or accidental to them.

HERBARIA.

But the means of comparison which we look for in vain in the published literature of science may be found in the collections of dried plants which botanists have formed for several generations. The local herbaria of our own day represent not only the different species found in a country, but the various forms which occur together with their distribution. They must supply the most certain materials for the minute comparison at any future epoch of the then existing vegetation with that of our own day.

The preservation of dried plants as a help in the study of systematic botany was first employed in the middle of the sixteenth century. The earliest herbarium of which we have any record is that of John Falconer, an Englishman who travelled in Italy between 1540 and 1547, and who brought with him to England a collection of dried plants fastened in a book. This was seen by William Turner, our first British botanist, who refers to it in his *Herbal*, published in 1551. Turner may have been already acquainted with this method of preserving plants, for in his enforced absence from England he studied at Bologna under Luca Ghini, the first professor of botany in Europe, who, there is reason to believe, originated the practice of making herbaria. Ghini's pupils, Aldrovandus and Cesalpini, formed extensive collections. Caspar Bauhin, whose *Prodromus* was the first attempt to digest the literature of botany, left a considerable herbarium, still preserved at Basle. No collection of English plants is known to exist older than the middle of the seventeenth century; a volume containing some British and many exotic plants collected in the year 1647 was some years ago acquired by the British Museum. Towards the end of that century, great activity was manifested in the collection of plants, not only in our own country, but in every district of the globe visited by travellers. The labours of Ray and Sloane, of Petiver and Plukenet are manifest not only in the works which they published, but in the collections that they made, which were purchased by the country in 1759 when the museum of Sir Hans Sloane became the nucleus of the now extensive collections of the British Museum. The most important of these collections in regard to British plants is the herbarium of Adam Buddle, collected nearly two hundred years ago, and containing an extensive series which formed the basis of a British flora, that unhappily for science was never published, though it still exists in manuscript. Other collections of British plants of the same age, but less complete, supplement those of Buddle: these various materials are in such a state of preservation as to permit of the most careful comparison with living plants, and they show that the two centuries which have elapsed since their collection have not modified in any particular the species contained in them. The early collectors contemplated merely the preservation of a single specimen of each species; consequently the data for an exhaustive comparison of the indigenous flora of Britain at the beginning of last century with that of the present are very imperfect as compared with those which we shall hand down to our successors for their use.

The collections made in other regions of the world in the seventeenth century, and included in the extensive herbarium of Sir Hans Sloane, are frequently being examined side by side with plants of our own day, but they do not show any peculiarities that distinguish them from recent collections. If any changes are taking place in plants, it is certain that the three hundred years during which their dried remains have been preserved in herbaria have been too short to exhibit them.

TIMBER.

Beyond the time of those early herbaria the materials which we owe in any way to the intervention of man have been preserved without any regard to their scientific interest. They consist mainly of materials used in building or for sepulture. The woods employed in mediæval buildings present no peculiarities by which they can be distinguished from existing woods; neither do the woods met with in Roman and British villages and burying places. From a large series collected by General Pitt-Rivers in extensive explorations carried on by him on the site of a village which had been occupied by the British before and after the appearance of the Romans, we find that the woods chiefly used by them were Oak, Birch, Hazel, and Willow, and at the latter period of occupation of the village the wood of the Spanish Chestnut (*Castanea vulgaris*, Lamk.) was so extensively employed that it must have been introduced and grown in the district. The gravel beds in the north of London, explored by Mr. W. G. Smith for the paleolithic implements in them, contained also fragments of Willow and Birch, and the rhizomes of *Osmunda regalis*, L.

EGYPTIAN TOMBS.

The most important materials, however, for the comparison of former vegetation of a known age with that of our own day have been supplied by the specimens which have been obtained from the tombs of the ancient Egyptians. Until recently these consisted mainly of fruits and seeds. These were all more or less carbonised, because the former rifting of the tombs had exposed them to the air. Ehrenberg, who accompanied Von Minutoli in his Egyptian expedition, determined the seeds which he had collected, but as he himself doubted the antiquity of some of the materials on which he reported, the scientific value of his enumeration is destroyed. Passalacqua in 1823 made considerable collections from tombs at Thebes, and these were carefully examined and described by the distinguished botanist Kunth. He pointed out, in a paper published sixty years ago, that these ancient seeds possessed the minute and apparently accidental peculiarities of their existing representatives. Unger, who visited Egypt, published in several papers identifications of the plant remains from the tombs; and one of the latest labours of Alexander Braun was an examination of the vegetable remains in the Egyptian Museum at Berlin, which was published, after his death, from his manuscript, under the careful editorship of Ascherson and Magnus. In this, twenty-four species were determined, some from imperfect materials, and necessarily with some hesitation as to the accuracy of their determination.

The recent exploration of unopened tombs belonging to an early period in the history of the Egyptian people has permitted the examination of the plants in a condition which could not have been anticipated. And, happily, the examination of these materials has been made by a botanist who is thoroughly acquainted with the existing flora of Egypt, for Dr. Schweinfurth has for a quarter of a century been exploring the plants of the Nile valley. The plant-remains were included within the mummy-wrappings, and being thus hermetically sealed, have been preserved with scarcely any change. By placing the plants in warm water, Dr. Schweinfurth had succeeded in preparing a series of specimens gathered 4000 years ago, which are as satisfactory for the purposes of science as any collected at the present day. These specimens consequently supply means for the closest examination and comparison with their living representatives. The colours of the flowers are still present, even the most evanescent, such as the violet of the Larkspur and Knapweed, and the scarlet of the Poppy; the chlorophyll remains in the leaves, and the sugar in the pulp of the raisins. Dr. Schweinfurth has determined no less than fifty-nine species, some of which are represented by the fruits employed as offerings to the dead,

others by the flowers and leaves made into garlands and the remainder by branches on which the body was placed, and which were enclosed within the wrappings.

The votive offerings consist of the fruits, seeds, or stems of twenty-nine species of plants. Three Palm fruits are common—the *Medemia Argon*, Würt., of the Nubian Desert, and the *Hyphæne thebaica*, Mart., of Upper Egypt, agreeing exactly with the fruits of these plants in our own day; also Dates of different forms resembling exactly the varieties of Dried Dates found now in the markets of Egypt. Two Figs are met with—*Ficus carica*, L., and *Ficus Sycomorus*, L., the latter exhibiting the incisions still employed by the inhabitants for the destruction of the Neuropterous insects which feed on them. The *Sycamore* was one of the sacred trees of Egypt, and the branches used for the bier of a mummy found at Abd-el-Qurna, of the twentieth dynasty (1000 years before the Christian era), were moistened and laid out by Dr. Schweinfurth—equalling, he says, the best specimens of this plant in our herbaria, and consequently permitting the most exact comparison with living *Sycamores*, from which they differ in no respect. The fruit of the Vine is common, and presents, besides some forms familiar to the modern grower, others which have been lost to cultivation. The leaves which have been obtained entire exactly agree in form with those cultivated at the present day, but the under surface is clothed with white hairs, a peculiarity Dr. Schweinfurth has not observed in any Egyptian Vines of our time. A very large quantity of Linseed was found in a tomb at Thebes of the twentieth dynasty, now 3000 years old, and a smaller quantity in a vase in another tomb of the twelfth dynasty, that is, 1000 years older. This belongs certainly to *Linum humile*, Mill., the species still cultivated in Egypt, from which the capsules do not differ in any respect. Braun had already determined this species preserved thus in the tombs, though he was not aware of its continued cultivation in Egypt. The berries of *Juniperus phœnicea*, L., are found in a perfect state of preservation, and present a somewhat larger average size than those obtained from this Juniper at the present day. Grains of Barley and Wheat are of frequent occurrence in the tombs; M. Mariette has found Barley in a grave at Sakbara of the fifth dynasty, 5400 years old.

The impurities found with the seeds of these cultivated plants show that the weeds which trouble the tillers of the soil at the present day in Egypt were equally the pests of their ancestors in those early ages. The Barley fields were infested with the same spiny Medick (*Medicago denticulata*, Willd.) which is still found in the grain crops of Egypt. The presence of the pods of *Sinapis arvensis*, L., among the Flax seed testifies to the presence of this weed in the Flax crops of the days of Pharaoh, as of our own time. There is not a single field of Flax in Egypt where this *Charlock* does not abound; and often in such quantity that its yellow flowers, just before the Flax comes into bloom, present the appearance of a crop of Mustard. The *Charlock* is *Sinapis arvensis*, L. var. *Alhoni*, Jacq., and is distinguished from the ordinary form by its globular and inflated silicles, which are as characteristically present in the ancient specimens from the tombs as in the living plants. *Kanex dentatus*, L., the Dock of the Egyptian fields of to-day, has been found in graves of the Greek period at Dra-Bu-Negga.

It is difficult without the actual inspection of the specimen plants employed as garlands, which have been prepared by Dr. Schweinfurth, to realise the wonderful condition of preservation in which they are. The colour of the petals of *Papaver Rhœas*, L., and the occasional presence of the dark patch at their bases present the same peculiarities as are still found in this species growing in Egyptian fields. The petals of the Larkspur (*Delphinium orientale*, Gaertn.) not only retain their reddish-violet colour, but present the peculiar markings which are still found in the living plant. A garland composed of wild Celery (*Apium graveolens*, L.) and small flowers of the blue Lotus (*Nymphaea ornata*, Sw.), fastened together by fibres of Papyrus, was found on a mummy of the twentieth dynasty, about 3000 years old. The leaves, flowers, and fruits of the wild Celery have been examined with the greatest care by Dr. Schweinfurth, who has demonstrated in the clearest manner their absolute identity with the indigenous form of this species now abundant in moist places in Egypt. The same may be said of the other plants used for garlands, including two species of Lichens.

* Extracted from Mr. Carruthers' presidential address to the Biological Section of the British Association at Birmingham.

It appears to have been a practice to lay out the dead bodies on a bier of fresh branches, and these were inclosed within the linen wrappings which enveloped the mummy. In this way there have been preserved branches of considerable size of *Ficus Sycamorus*, L., *Olea europæa*, L., *Mimusops Schimperii*, H., and *Tamarix nilotica*, Ehrh. The *Mimusops* is of frequent occurrence in the mural decorations of the ancient temples; its fruit had been detected amongst the offerings to the dead, and detached leaves had been found made up into garlands, but the discovery of branches with their leaves still attached, and in one case with the fruit adhering, has established that this plant is the Abyssinian species to which Schimper's name has been given, and which is characterised by the long and slender petiole of the leaf.

In none of the species, except the Vine to which I have referred, which Dr. Schweinfurth has discovered, and of which he has made a careful study, has he been able to detect any peculiarities in the living plants which are absent in those obtained from the tombs.

Before passing from these Egyptian plants I would draw attention to the quality of the cereals. They are good specimens of the cereals still cultivated. This observation is true also of the cultivated grains which I have examined, belonging to prehistoric times. The Wheat found in the purely British portion of the ancient village explored by General Pitt-Rivers is equal to the average of Wheat cultivated at the present day. This is the more remarkable, because the two samples from the later Romano-British period obtained by General Pitt-Rivers are very much smaller, though they are not unlike the small hard grains of Wheat still cultivated on thin chalk soils. The Wheat from lake dwellings in Switzerland, for which I am indebted to J. T. Lee, Esq., F.G.S., are fair samples. My colleague, Mr. W. Fawcett, has recently brought me from America grains of Maize from the prehistoric mounds in the valley of the Mississippi, and from the tombs of the Incas of Peru, which represent also fair samples of this great food substance of the New World. The early peoples of both worlds had then under cultivation productive varieties of these important food-plants, and it is remarkable that in our own country, with all the appliances of scientific cultivation and intelligent farming, we have not been able to appreciate surely the grains which were harvested by our rude ancestors of 2000 years ago.

(To be continued.)

TEAK-WOOD AND PAPER-MAKING IN SIAM.

REFERRING to Teak-wood, in his report on the trade of Bangkok for the past year, Mr. Consul French says:—

Throughout the year the prices offered for Teak in Europe and China were good, and the export from Bangkok was, although below that of the two previous years, above the average of the preceding five years. The rivers have now for two years past been very low, and consequently much of the wood could not be floated down. There is now a considerable quantity of logs up country, the accumulation resulting from two bad seasons, awaiting favourable floods to get down. More European capital is now being invested in the working of the Teak forests, and it is to be hoped that the experiment will result successfully. Hitherto the forests have been leased chiefly to Burmese, very few of whom have sufficient capital. The result has been that the forests have been worked in a meagre and unsatisfactory fashion, and litigation between the foresters and the persons advancing their money has been bitter and constant. The export of Teak may be said to almost entirely depend upon the ship building business in Europe, and as long as the present stagnation in that trade continues the prospect before Teak merchants will not be encouraging.

Native paper, it is said, is manufactured from the bark of a tree called "Toukoï," the process of which is a simple one, described as follows:—The smaller branches of the tree are cut and steeped in water for two or three days. The bark is then stripped off, and brought in bundles and sold to persons who make the paper. The bundles of bark are put in water for two or three days by the paper-maker, and having been cleansed from dirt, are taken out and steamed over a slow fire for two days, a little clean stone-lime being sprinkled through the bark. It is then steeped

in water in earthen jars, and more lime is added. After a few days it is taken out of the jars, and having been well washed, to free it from the lime, it is beaten with a wooden mallet until it becomes a mass of soft pulp. A frame of netting about 6½ feet long, and of width varying from 18 to 5 inches, is set afloat in water, and the pulp, having first been again mixed up with water, is skilfully poured out on to the frame, so as to be equally distributed over it. The frame is then lifted out of the water, and a small wooden roller is run over the surface of the pulp. By this process the water is squeezed out and the pulp pressed together. The frame with the pulp on it is then set to dry in the sun. In the course of some ten hours it is quite dry, and the sheet of paper can be lifted off the frame. It now only remains to smooth the surface; this is done by applying a thin paste of rice-flour to the surface, and then rubbing it down with a smooth stone. A black paper, which is written upon with a slate or steatite pencil, is made by colouring the surface with a mixture of charcoal. The paper here described is made from the bark of *Broussonetia papyrifera*. J. K. J.

PAPAVER PAVONINUM.

I VENTURE to send you a few specimens of a new annual Poppy, *Papaver pavoninum* (fig. 67, p. 329), Schrenk. It is of dwarf habit, few of the plants exceeding a foot in height. The foliage strikes one as being neater and decidedly less weedy than in most of the annual Poppies; but it is the bud and expanded flower which offer the most remarkable features. The two sepals are each prolonged at the tip into a curious hornlike appendage, which would have justified some such specific name as *bicornutum*, but I presume Schrenk's name must have the priority.

The petals are of a brilliant scarlet, each being marked near the base with a zone of glossy black, the united bands forming a complete ring of a striking effect during the first hours of the day. When fully expanded they are nearly 4 inches across. The plant is very free flowering, one of moderate size will produce a hundred flowers. It is a native of Turkestan, whence seeds were sent by Dr. Albert Regel. W. Thompson, Ipswich. [The plant is also found in Afghanistan, being the *P. Cornigerum* of Stocks (see Boissier, *Flora Orientalis*, i., 116). Ed.]

MARKET PLANTS.

THE establishment of Messrs. Gregory and Evans, at Sidcup, is one of the large nurseries that have come into existence in recent times, where plants and flowers are grown to supply the all but insatiable market Covent Garden. The land, some eight acres, was bought about seven years ago. Now considerably over half the space is covered with glass. The houses, in common with those now built by the leading market growers, are span-roofed, and so constructed as to give a maximum amount of light to the various plants grown in them. Yet in one respect Messrs. Gregory & Evans' houses differ from those in most of the market places so far that they have side-lights about 18 inches deep, and by this arrangement still more light is admitted. Needless to say that at the present day, with the keen competition that exists, anything in the shape of flowering plants that are not as short-jointed, compact, and sturdy as the tufts of Heather that grow on the mountains, are useless in Covent Garden. This is so well understood by the growers that those who are unlucky enough to be in possession of the old-fashioned erections, deficient of light, occupy them with Palms, Ferns, Aspidistras, and other fine leaved plants, and even in the case of these those who have thoroughly light houses have a decided advantage in the prices they can realise.

Pelargoniums are a leading feature at Longlands, the greater part of a block of eleven houses, each 100 feet by 15, being filled with them. The varieties comprise those that find the most favour in the market. The public who buy these plants know and care nothing about the niceties of the florist's standard. What they require are decorative plants of pure and bright colours, with the markings well defined, combined with a short-jointed sturdy habit, and a profuse disposition to flower so as to form a sheet of bloom backed with healthy foliage. To those who have not an opportunity of seeing the favourite market varieties, yet who may be desirous to grow kinds

that will give the best return in the shape of telling flowers, a short list of the leading varieties grown by Messrs. Gregory and Evans, with their colours, may be of use; Braid's Decorator, white, with deep crimson spots on the petals; Haye's Decorator, deep reddish-pink; grandis odorata, brilliant crimson, with dark feathered markings; Smith's Regale, petals pink, edged with white, dark feathered markings; Alfred Drown, a high coloured flower, with large conspicuous spot on all the petals; Kingston Beauty, pure white ground, with maroon blotch on top petals, smaller spots well defined on lower petals; virginale, white, with maroon spots, a very early sort; Mrs. Bradshaw, flesh white, with large blackish-purple feather; a seedling raised here is one of the best sorts, crimson ground colour, with dark blotch on top petals; another seedling named Fire Ball, vivid carmine with deep feathered markings; Charles Braid, bright red, with violet centre and dark blotch on top petals; Alice, flesh colour with small red spots on lower petals, and large feathered blotch on top petals; Miss Wetherall, pink ground, white centre, large feathered spot on top petals; Robert, green, ground colour a vivid shade of violet crimson, dark spots on top petals; Duchess of Bedford, pink white ground colour, small pink feathered spot on top petals; Hercules, crimson, with dark feathered spots on top petals; Miss Nellie, pure white, crimson feathered spots on all the petals; Murremurens Improved, a bright-coloured effective variety; Black Prince, maroon, petals edged with white. The remaining portion of this lot of houses is filled with Ferns, mostly *Adiantum cuneatum*, of which 100,000 are raised from seed annually, all grown in 48-sized pots. A favourite combination in the market now is a plant of *Pteris cretica* and *Adiantum cuneatum* growing together in the same pot. A pretty crested form of *Adiantum* has appeared here; it is distinct and effective in appearance. *Pteris tremula* is largely grown at Messrs. Gregory & Evans' other place at Lee; ten houses are filled with this Fern and *Cyperus*. *Polydium aureum*, another good market Fern, is grown in considerable numbers.

Dracænas in quantity are grown, consisting principally of *D. terminalis*, *D. rubra*, and the narrow-leaved *D. congesta*, which is one of the best plants for a room.

Several houses are occupied by Fuchsias, that take the place of Pelargoniums and other things, which are cleared off early in spring. Of the yellow Marguerite, *Etoile d'Or*, numbers are grown.

A large span-roofed house is devoted to Azaleas for cutting; the old *indica alba* and Fielder's White are liked better than the more formal-shaped kinds.

Rhododendrons, both the red and white varieties in various stages, so as to keep up a supply all the season, are grown by the thousand.

A set of houses, five in number, each 150 feet long, are filled with various things. Two others, each 180 feet long and 25 feet wide, are filled with *Gardenias*, *Ficus elastica*, *Pandanus Veitchii*, *Croton Weismannii*, and Palms, of such kinds as *Phœnix reclinata*, *Scaevolaria*, and *Lantana borbonica*.

A commencement has been made with pot Roses, a house 150 feet long, by 30 wide, is filled with plants that have been grafted this year, many of which, at the end of May, when I saw them were from 4 to 5 feet high; *Maréchal Niel*, *Gloire de Dijon*, *Niphotos*, and *Isabella Sprunt*, are the principal varieties grown. Another house of the same length as the last, is similarly occupied.

Another lot of nine houses, each 100 feet by 12, is principally devoted to pink, white, and red *Zonal Pelargoniums*. A long house contains *Cyclamens* raised from seed last summer, and ready for removal to the pots in which they are to flower. A pair of houses, each 200 feet long by 24 wide, and 12 feet high, were just being finished. Heaths, both winter and spring flowering varieties, are a speciality at this nursery; in addition to various long pits, two houses, each 200 feet by 15 are occupied by them. The varieties grown to bloom during autumn and winter are *E. Caffra*, (*syn.* *E. proliфера*), *E. gracilis*, and *E. byemalis superba*, which has larger flowers than the old *E. byemalis*: of these from 50,000 to 60,000 are grown. *E. perspicua oana*, *E. perspicua erecta*, *E. ventricosa coccinea minor*, and *E. ventricosa magnifica* are the leading spring flowering varieties for which there is a demand in Covent Garden. It may seem strange, that out of the hundred, of beautiful varieties of these plants that are in cultivation there should be so few that

have been found that will conform to the small-pot culture indispensable in a market plant, and that suit the taste of the public. In fact, a new plant, or even an old one, that will answer all that is required by both the growers and the buyers is a

upon by plant growers as evidences of more than ordinary skillful cultivation. Most people who are conversant with plant-growing know what is done with the late-flowering Heath (*E. byemalis*) already named; the size the plants are grown to, coupled

high-fed plants out of each dozen of this variety that is grown lives to see the summer following its blooming; and in the case of a variety such as the Cavendish Heath, that after making its growth remains all but dormant through the winter, the use of manurial stimulants to the extent necessary to get such growth with the limited root-space is much more difficult. Some of the plants are flowered at two years old, but the majority are three years; many of the latter were 15 inches through, by as much or more in height, with eight or ten spiky shoots, 9 or 10 inches long, the flowers almost hiding the foliage. From 2000 to 3000 of these were grown this year, and found ready sale.

Eight of Rochford's boilers are at work in the place, some of them 15 feet long, others 9 feet—in some respects the latter are liked best. As an evidence of the power of the smaller size I may mention that one of them is heating two of the 200 feet by 15 houses, each of which has four rows of 4-inch piping, which, with the mains, connections, and the lengths running across the end of the houses, will collectively be not less than 18,000 feet; yet I was informed that there is never any occasion to push the fire, but rather a necessity for keeping it checked by banking up. *T. B.*

THE COLONIAL EXHIBITION.

No. X.

INDIA (*continued*)—Dye products, and the method of their manufacture or preparation, are well illustrated in the Indian Court. Amongst the products themselves the samples of Annatto (*Bixa Orellana*) will be noticed for the brightness of the colour, and the large size of the seeds. This product is well represented amongst the Ceylon and West Indian exhibits, and is referred to under those heads. Here are also large samples of Tissoo or Pulas flowers (*Butea frondosa*), of a bright, fresh yellow colour, used for dyeing yellow and orange-red. The tree is one of those which yield a variety of products. The root-bark gives a good fibre used for coarse cordage, also for making slow matches, and for caulking the seams of boats. The gum or resin, under the name of Beogal Kino, is astringent, and is used in medicine, while the seeds are used as a purgative and vermifuge, and the leaves are employed as plates. Here are pods of *Acacia concinna*, which contain a quantity of saponaceous matter, and are used as soap, especially for washing the hair. The leaves of this species are eaten on account of the acid flavour they possess. Of indigo the exhibits are both good and numerous, and the model of an indigo factory will not fail to attract the attention of all visitors, so accurate is it in detail and so perfect in finish. The model shows the process of steeping the plants and pressing them in the vats or divisions, from which the water runs by a kind of pan into a large receptacle below, in which the workmen stand up to their middles in indigo, stirring it with long poles, and in a room behind is seen wire or wicker frames on which the cakes of indigo are placed to dry. The model gives a very good idea of the preparation of an important article of commerce about which but little is popularly known.

The other models illustrating Indian industries are oil pressing, Sugar-cane pressing, and the preparation of sugar from the Date Palm, in which the collector of the toddy is represented in the crown of leaves drawing the juice from the freshly cut spathe.

In the matter of direct forest produce, such as timbers and Bamboos, many excellent examples are shown. The timber trophy or screen at the entrance of the Economic Court is composed of small specimens of a great variety of useful timbers, the most striking specimens, however, are the large planks and blocks of Padonk (*Pterocarpus indicus*), of which also an enormous squared trunk lies outside in the adjoining promenade. The Padonk, or as it is sometimes called Andaman Red-wood, is a lofty tree of Burmah and the Andaman Islands. The wood is fairly hard, even grained, and easily worked, and is well known for its deep red colour, which darkens or becomes brown on exposure to the light. It is a very useful wood, and is much used for furniture as well as for cabinet work, carriage wheels, and similar purposes in India.

Another wood that will no doubt attract considerable attention amongst cabinet makers, is the Andaman marble wood (*Diospyros Kurzii*), an evergreen, the native of the Andaman Islands, as its common name indicates. The wood is very hard, irregularly

FIG. 67.—PAPAVER PAVONINUM: HARDY ANNUAL: FLOWERS SCARLET, WITH A GREY EYE BORDERED WITH BLACK. (SEE P. 325)

rarity. Yet now and then one turns up, such as the marvellous examples of *Erica Cavendishii* that during the last two or three seasons Messrs. Gregory & Evans have produced, and which for their size and strength of growth, smothered with flowers as they are, and grown in such little pots—40's and 48's—are looked

with the profusion of flowers they produce in the little pots, which growth is the outcome of careful observation in ascertaining how much manurial feeding the plants will bear without its killing them before they bloom; and though the experienced cultivator can manage this, it is a question if one of the

blotched with black markings upon a greyish ground, usually arranged in alternate streaks of grey and black, but in the plank exhibited at Kensington, the figuring resembles as near as possible what might be effected by the casual upsetting of an ink-bottle, an appearance not to be found in any other wood. The smaller specimens of woods are too numerous and too well-known to claim any special notice, notwithstanding that many of them are of excellent quality, both on the score of durability and for their fine markings or figure, and ought to be better known amongst English hard wood dealers.

In the matter of Bamboos, the well-known bridge in the centre of the Court will be remembered as an excellent illustration of what these gigantic grasses can be applied to, besides which the numerous uses to which they are put in India are well shown in the couches, chairs, baskets, &c., which surround the bridge, some excellent photographs of Bamboos bridges spanning the Sutlej, are also shown in close proximity. A stem of a species of Calamus, a slender climbing Palm, often popularly confounded with the Bamboos, is shown under the roof of the court, and reaches almost its entire length. This, though a fine specimen, is not however, so long as one contained in the No. 2 Museum at Kew, which measures over 400 feet, or about the height of the dome of St. Paul's Cathedral. These stems are very pliable, and some of the more slender species are known as canes and are used when split for the bottoms of chairs. Another Palm product which will attract attention is a dug-out or canoe, such as is ordinarily used in India, consisting of the hollowed stem of a Palm from which one side has been cut away and the central, cellular portion removed. The bottom of the canoe has therefore no approach to a keel, but is simply rounded—the shape or form of the trunk.

As stated before, the Indian exhibits are extremely numerous and interesting. A fine set of the products have been obtained for the Kew Museums, and we may have an opportunity of referring to them more in detail at a future time. *John K. Jackson, Curator, Museums, Royal Gardens, Kew.*

THE HYACINTH, TULIP, AND OTHER DUTCH BULBS.

THE history of the Hyacinth, Tulip, and other Dutch roots has been written more than once, and it is unnecessary to say any more on that subject. I am constrained to pen a few remarks at this time because we are now making preparations for next season's display. Suggestions have been made, from time to time, to our English florists to grow their own bulbs rather than trust to the Dutch to supply them. If these suggestions had been practical they would doubtless have been carried out long ago. The trade find it answers their purpose best to purchase Dutch-grown roots, but it seems to be a question now whether the business is profitable to the growers. The competition has been very keen in recent years. We can in our own gardens imitate the careful culture of the Dutch growers and grow Hyacinths out-of-doors year after year, as well as they do, and save the continual annual expense for border culture. The system of culture pursued in Holland may be different now than it used to be, but an excellent article was published in a Dutch paper nearly half a century ago entitled "A Year's Culture of the Hyacinth at Haarlem."

THE COMPOST.

October being the season for planting was a good date to begin with, and the preparation of the soil was very minutely described, and I know from experience, that the cultural directions given there, are admirably adapted for English gardens. The soil should be very sandy, fine and light without any appearance of stones or gravel, and should look as if it had been passed through a sieve. All kinds of loam or stiff soil should be avoided. The soil should be such that the wind can separate the particles. The thin sand of the Dutch downs, which is of a pale yellow colour, is extensively used to make the light loam still lighter, and it is made rich by placing a layer of cow manure below the bulbs; the base of the bulbs should be 6 inches from the manure. Dry weather is always chosen for planting, but the reasons for this are obvious and need not be mentioned. The beds after being platted, are covered with reeds to still further protect them from wet. All this, and the further cultural requirements, can be done in this

country as well as anywhere else, and few flowers better repay attention than the Hyacinth. What are termed common Hyacinths can be purchased cheaply in the first place, and they can be grown on from year to year if the leaves are allowed to decay. The bulbs should be dug out of the ground about the end of June, and this will allow of its being planted with Asters, Stocks, or other plants for late summer and autumn flowering. We have mixed the compost for our bulbs that have to be grown in pots to-day. This is usually done in August, but we are rather later this year. For Hyacinths, the mixture is two parts loam, one leaf mould, one of river sand, and one of leaf-mould, and one of cow manure. We use the same for Tulips, except that the manure is taken from the stable instead of the cow-house. For Narcissus, Crocus and a few other things we mix the two composts together. I do not know whether there is so much in the potting soil as we have been led to suppose. Perhaps another mixture would give equally as good results. The every day after treatment of the plants has, perhaps, more to do with the full perfect development of the flowers than anything else. At the same time, I would not care to use a different potting soil. By the advice of an eminent cultivator I used a larger proportion of manure, but found this was an error, as they did better with the proportion I have stated. About twenty years ago I was advised to pot the Hyacinths in pure two-year-old cow manure, reduced almost to mould, which crumbled into powder on being broken up with the hands. I tried a few bulbs only, and scored a lamentable failure.

BUYING BULBS.

The bulb catalogues are now coming in, and most of the dealers have obtained their supply. Some amateurs wait until the end of the season, thinking that they will get bargains in that way, or will pick up cheap lots at auctions. Goods may be obtained for less money, but it does not follow that they will be cheap. No greater error is made by purchasers of any kind of goods than to suppose because they cost little money therefore they are cheap. The highest priced articles are invariably the cheapest, and the most satisfactory, both at the end and at the beginning. Having, therefore, obtained a good article from a respectable dealer, proceed to examine the bulbs to see that they are all right, and according to the order.

POTTING.

Those intended for early flowering should be potted about the middle of September, on to the end of that month—the ordinary collection about the end of October. The dried roots begin to push out their roots by that time, and they should not be left out of the potting soil after that. The rough and ready way of potting these bulbs is to push them into the potting soil, level the mould with the fingers, and the operation is completed. The right way is to make a space with the fingers, place a little clean sand in the bottom, the base of the Hyacinth bulb will rest on the sand, the potting soil should then be gently pressed round the bulb, leaving the crown just above the surface, another pinch of sand should be placed over it, so that the compost is not firmer under the bulb than it is any where else; the same remark holds good with all the other bulbs. When potted with Cocca-nut fibre in an open place, and cover with Cocca-nut fibre refuse. They should be placed on a dry hard bottom of ashes, through which worms are not likely to push their way. I may say we treat all our bulbs alike.

NARCISSUS.

The varieties of Narcissus Tazetta (Polyanthus Narcissus) have always been favourite plants for pot culture; but during recent years I have grown many of the border varieties in pots; with a little forcing they come in before those out-of-doors. Horsefieldii, maximus, princeps, and obvallaris are very distinct, and are much valued for forcing. I grew a few spurius coronatus (General Gordon) last year, and they formed a very good addition to our collection. None of them are taken out of the plunging material until they have started to grow; they must at least have made considerable root growth. A good place for them when taken out of the damp Cocca-nut fibre is a close frame; a mat may be thrown over the glass, to keep the blanched growth dark, but they must be gradually inured to the light and air. The pots may either be removed to the greenhouse or conservatory, as circumstances demand.

WATERING.

The whole of these bulbs require considerable attention as regards watering. Many persons fancy that because Hyacinths can be grown and flowered in glasses filled with water, that the soil in the pots may be water-logged, like a marsh, and suppose that Hyacinths will do well with such treatment. The fact is they do not need, and ought not to receive, so much water as the Tulip and Narcissus plants. The bulbs of Hyacinths are potted singly in 6 inch pots; they have therefore plenty of soil to grow in, and, as a rule, do not require water more than twice in a week, even when in the flowering stage; in the early stages of their growth, once a week may be often enough. These may seem to some experienced gardeners trifling details, but many persons miss their way for lack of such knowledge.

GOOD VARIETIES OF BULBS.

There is no need to grow a large number of varieties of any of these bulbous plants. We grow of Hyacinths the following:—Cavaignac, pale pink, Fabiola, pale rose, slightly striped; Garibaldi, crimson; Gigantea, very pale rose; King of the Reds, bright red; Macaulay, deep rose; Safaterre, orange-red; Von Schiller, salmon; Vuurbaek, rich, bright red, white varieties; Alba maxima, La grande, Mont Blanc, Grandeur à Merveille, bluish, pale blue; Baron van Tuyl, dark blue; Blondin, pale blue; Czár Peter, pale blue; De Candolle, reddish-lilac; Grand Maître, violet-blue; King of the Blues, the best dark blue; Lord Derby, the best of the pale blue kinds; Marie, purple-blue; Masterpiece, black; Princess Mary of Cambridge, lavender; Souvenir, J. H. Veen, purple blue; The Sultan, purple-yellow; King of Yellows, Bird of Paradise, and Ida. The above are all single. We grow of double varieties, Koh-i-noor, salmon; Laurens Koster, dark blue; and Van Speyk, pale blue. Of Polyanthus Narcissus, the best are Bathurst, Gloriosa, Grand Monarque, Her Majesty, Newton, and Queen of the Netherlands.

The few Tulips cultivated in our garden, are Chrysolora, yellow; Fabiola, rose, white feather; Joost van Vondel, crimson; and the same variety, white; Keizer Kroon, crimson and yellow; Ophir d'Or, pure yellow; Proserpine, rose; Van der Neer, purple; Vermilion Brilliant, and Wouverman, violet-purple. *J. Douglas.*

THE CULTIVATION OF TOBACCO IN DEVONSHIRE.

As our readers are already aware, experiments in the culture of Tobacco in England are in full swing, and to Mr. Elliott (Luceombe, Pince & Co.), of Alphington Road, St. Thomas, has fallen the distinction of experimentalist in this portion of the country. There are so many restrictions connected with the "trial growths," and the revenue authorities treat these experiments for the commercial welfare with so much severity of condescension that persons undertaking the cultivation for experiments' sake are to be congratulated both for their courage and for their desire to find out whether the growing of the fragrant weed in this country will be likely to prove a source of profit. Trials in other places thus far are encouraging, and Mr. Elliott's efforts are certainly to be commended.

Mr. Elliott put in his Tobacco plants about June 1 in this year, raising from seeds of the Virginia plant. Acting upon the advice of an authority of some note in the matter of Tobacco cultivation, no manure was used by Mr. Elliott, whose idea throughout has been to produce quality instead of quantity. The plants have an exceedingly healthy look, but they nevertheless require a good deal of attention. The plucking of the laterals which form at the base of every leaf is the matter of daily attention, and flower-spikes have to be just as carefully and persistently removed. The object of this is to throw all the vigour of the plant into a limited number of leaves—main strength being the desideratum. Mr. Elliott's plants have from nine to thirteen leaves, the average size being 2 feet long by 10 inches broad. If the weather continues fine the plants will be cut about September 14, and the process of drying and fermentation will then be resorted to. After being cut, and before being hung up to dry, Tobacco plants are allowed to lie an hour or two on the ground, when the leaves will become wilted and drooping—a convenience in regard to the ensuing process. It is whilst drying that the leaves begin gradually to assume the rich brown colour proper to the com-

merical article. The leaves are afterwards strided from the stalks, damped, and tied into a bundle of a dozen or more of leaves, strings being tied towards the base of the footstalk. The bundles are packed symmetrically in boxes or between boards, and heavily weighted. Whilst in this state a process of slow fermentation occurs, the Tobacco not being fit for use until this takes place. Mr. Elliott intends to conduct his plants all through these operations, and he has no reason whatever to fear anything like failure. Very wisely, however, he has set before him the sole task of discovery whether smoking tobacco can be successfully cultivated in this country—the question of profit he has very properly made a matter of after consideration. It has been in communication with that well known authority on the subject, Col. R. Trevor Clarke, of Arminster, who applauds the mode of procedure adopted by Mr. Elliott, and thinks that with the climatic advantages which we possess in Devonshire, a creditable crop of “a smokeable article” ought to be cultivated. The other day a competent writer in a well-known London journal said that he knew of no place in England better suited for Tobacco cultivation than the valleys of Torquay, which was equivalent to saying a good word for the rest of this lovely county. In fact, it was this recommendation that prompted Mr. Elliott to his present experiments.

It may be stated that that gentleman has had to give sureties to the extent of £50 to abide by Government stipulations, and after he has taken the trouble to cultivate and prepare the Tobacco for smoking purposes he will either have to pay the ordinary duty on it, or send it to authorised custom stores. Cultivators of over an acre have to find surety for £100, but Mr. Elliott's is under the acre. There is a penalty amounting to £1600 for cultivating more than half a land yard of Tobacco, whilst purchasers of the weed, when illegally cultivated, are liable to be called upon to forfeit £1000. It will be seen, in face of all the restrictions pointed out, how much the experimentalists are entitled to public gratitude. Visitors to the American Tobacco plantations—gentlemen conversant with the growth and habits of the plant—have seen Mr. Elliott's crop, and their comparative comments are most favourable. We hope, later on, to record that the anticipations formed in connection with Tobacco growing at the Exeter Nursery have been fully realised. “*Devon Evening Express*.”

Orchid Notes and Gleanings.

ANGRÆCUM SCOTTIANUM.

AMONGST the various forms with which the southern half of Africa, Madagascar, and the neighbouring islands abound, the subject of this note is interesting, and pretty as it is rare. The latter statement applies to the plant in this country, for when figured in the *Gardeners' Chronicle*, 1880, vol. xiv., p. 137, fig. 30, there were evidently only two plants in the country. It comes from the Comoro Islands, and forms an excellent companion plant to *A. Kotschyi*, from Zanzibar. The latter is notable not only for the length of its spur, but also from the fact that it is spirally twisted. The spur in both cases is intermediate between that of the common species and the now well known and popular *A. sesquipedale*. The spur of *A. Scottianum* in the *Botanical Magazine*, 6723, where the plant is figured, is said to be 4 inches long, but a plant flowering at Kew has a spur almost or quite 6 inches long. It is round, not compressed, as in *A. citratum* and some others, of a pale brownish-yellow, and white at the base, but seems to vary somewhat in that respect. The sepals and petals are narrow and white, but altogether surpassed by the size and purity of the labellum, which constitutes the most conspicuous feature of the flower. All this agrees with the usual characters of *Angræcum*, but the slender stems and almost terete, fleshy leaves, remind one of *Vanda teres*, a *Luisia*, or a *Drassavola*. It should be fastened to a block or raft, mossed over with sphagnum, and hung up near the light in the East Indian house, as it requires a moderately high temperature, and such a position is also favourable to the pendent inflorescence and resuplicate flowers. ♀. F.

“LINDENIA.”

The plants figured in the last number are *Epilendrum atropurpureum* var. *Kandi*, t. 49, a racemose species with oblong brown segments, edged with yellow, and a white 3-lobed lip streaked with violet. The variety is stated to be a Brazilian (Amazon) form of a species widely distributed from Guatemala southwards. Much heat and a position near the glass are cultural requisites. After the plant has flowered it should be allowed to go to rest, and the supply of water consequently diminished.

Cypripedium microhylum ×, t. 50, is a hybrid between *C. niveum* and *C. Duryii*. It has white flowers, with a central violet streak on the segments. See *Gardeners' Chronicle*, xvii., p. 77.

Stanhopea ligina, t. 51, a grand old plant, so handsome, so extraordinary, so fragrant, that we wonder we do not see it more frequently, especially as its culture is comparatively easy. The short duration of the flowers, however, is one reason why these plants are not in much favour.

Phalænopsis sumatrana, t. 52, a species with a flat 5-starred flower, the segments obovate-acute, cream-coloured, with transverse bars of pale purple. The lip is small and white, with orange spots on the lateral lobes, while the central one is streaked with purple and brown. A high temperature, combined with abundance of moisture, is requisite in the growing season. If grown in pots the greatest care must be taken to secure adequate drainage.

ORCHIDS IN FLOWER AT THE FIRS, LAWRIE PARK, SUDENHAM.

This is perhaps the dullest season of the whole year to visit a collection of Orchids with the expectation of finding a display of plants in flower, but the recent importations have very much added to our stock of species flowering at this season. The field from which our supply is obtained is the world, and few corners have been left unexplored by the persevering collectors. Quite a recent introduction is that singular looking plant *Oncidium Jonesianum*, a species that has been introduced in abundance during the last year. It is now flowering in great beauty in Mr. Dorman's garden; there are a number of good specimens; one plant has five spikes on it. The longest spike is 2 feet 6 inches long, and has sixteen flowers on it, the number of blooms on the plant being fifty-two. The flowers also last long in beauty, even in the warmest house; some of them have been in good condition six weeks, and show no signs of fading. There is great variety in the reddish-brown spots and blotches; also in the size of the flowers, which are all creamy white, with a greenish tinge. The plants seem to succeed best on teak rafts. In the same house are three handsome examples of *Vanda Sanderiana* with a flower spike on each; eight flowers on one spike. This is a splendid addition to the September flowering Orchids, and it also seems to succeed well in the warmest house near the glass. The flowers have been so recently described, that no more need be said about them, but those Orchid fanciers who had not had an opportunity to see them, have a pleasure in store of no ordinary kind. These two Orchids are at present the principal feature in the warmest house; in the adjoining house, which is for *Cattleyas*, *C. luteola* is what the ladies would call “sweetly pretty,” it is very small as a *Cattleya*, but the flowers have yellow sepals and petals; the lip of the same colour, orange at the base, with purplish lines in the throat. In the large *Cattleya*-house, *Ludia elegans prasiata* is very charming; it is quite distinct as a variety, the sepals and petals are dull rose-purple, with a violet-purple lip. Mr. Dorman possesses one of the largest specimens of the new white *Lælia* ancypts type, but neither that nor any other of the white type show flowering sheaths, but this shy habit of flowering, is a characteristic of *L. anceps Dawsonii*; they are all growing well, however, and will flower in due course. Yet, another *Cattleya*-house, in which it is to be found a famous collection of no less than eight varieties of *C. Eldorado* in flower. The pure white form is very beautiful, the white is of the purest, with a very rich orange blotch in the centre of the lip. This is grown here under the name of *C. Wallisii*; but probably *C. virginialis* of the *Ill. Hort.*, t. 257, has a prior claim; another form has white sepals and petals, the lip has a purple margin with yellow blotch in centre; a very handsome variety has rose-hued sepals and petals with orange blotch. The flowers of all of them have the sepals

and petals well opened. The usual fault with this species is that the flowers do not open out well like most other *Cattleyas*. A plant or two of the shy flowering, but handsome *C. speciosissima* is an attraction in this house. Another lovely Orchid in flower here is *Sobralia virginialis*, the flowers of good form, large in size, and pure white. The lip is slightly crumpled and reflexed, marked with gamboge-yellow in the centre. A nice group of *Vanda cerulea* is doing well in one of the *Cattleya*-houses, they are placed near the door, which is kept open to admit air freely amongst the plants. In one of the cool houses there are three plants of *Maxillaria Sanderiana* growing very freely, this is undoubtedly the finest species in the genus, and no more to be named with *M. grandiflora* than moonshine is to be compared to sunshine. *Oncidium Phalænopsis* is also very pretty in the form of a good spike in the cool-house, this and an allied species, *O. cucullatum*, ought to be in the most select collection of cool Orchids. ♀. D.

CATTELEYA LODDIGESII CANDIDA.

A lovely variety of this old well known plant; flowers snow-white with green tips of sepals and green middle lines of them outside. There is a certain ethereal lightest hue of lightest purple on the petals. It was kindly sent by Mr. Tautz, of Studley House, Goldhawk Road, London, W. *H. G. Rehb. f.*

VANDA SANDERIANA.

When *Vanda Sanderiana* was first imported, one heard the idea expressed now and again that it would prove itself to be a shy bloomer, but really there was no foundation for such an idea, for it was clearly seen by the abundance of old flower stems upon the imported plants, that they had flowered very freely in their native homes, and since we have had them in our Orchid Houses, such an idea must have exploded long since. For we flowered here (W. Vanner, Esq., Camlet Wood), last year, three small plants of this beautiful *Vanda*, one 5 inches high with one spike, another 6 inches, one fine spike, and one 12 inches high, with two very fine spikes, and they are showing the same floriferousness again this year, which proves that it is one of the freest to flower while they are small, and certainly it is one of the most beautiful of the *Vanda* tribe. *W. Robbins, Chislehurst.*

CATTELEYA CROCATTA.

Some confusion and uncertainty have evidently arisen in the minds of the writers whose contributions respecting this plant have recently appeared in your pages. Perhaps the best way of clearing away this uncertainty is to permit you to have an opportunity of inspecting a flower of the original plant. I send you therefore a bloom of *Cattleya (laliata) crocata*, as named by Professor R.ichenbach for my employer, E. G. Wrigley, Esq., Howick House, Preston. The label of the plant has: Rehb. 27—4—82; whether the date the bloom was received by the worthy Professor, or the returned communication with name attached, I am not prepared to say. However, the bloom was then considered worthy of a distinct name, and the plant is now known as *C. crocata*.

In your number for June 12, 1886, p. 767, Mr. De B. Crawshaw says:—“*Cattleya Percivalii* alba was certified by the Royal Horticultural Society's Committee, and was named afterwards by Professor H. G. Reichenbach as *C. crocata*. Holding the same opinion as others, that the Professor, who does his best to please all, knows what he is about, I fancy that his name ought to stand, and *C. P.* alba should fall through. I would be the last to cut away a *protégé* of my friend. I know very little of *C. Percivalii* alba, so far as growing the plant is concerned. I remember a plant in the Percival Collection so marked, that was pointed out to me during the time the plants were on view at the nursery grounds of the Liverpool Horticultural Company; this plant flowered in February, 1884, and was exhibited by the late Mr. Percival at South Kensington shortly afterwards (see the *Orchid Growers' Manual*, sixth edition, p. 107). This, I think, clears away the statement that the name of *C. P.* alba was given first, and that *C. crocata* afterwards. Still it does not follow that either one or the other name should be allowed to fall, for there can be no doubt as Mr. De B. Crawshaw says, the Professor knows what he is about, and it is more than probable that both names will be retained, as they will refer to two distinct varieties

of plants. Surely the group of *C. P. alba* will be similar to the type *C. Percivaliana*. The growth of *C. crocata* is more in the way of *C. Eldorado*, and since it flowers when that species is in bloom, we cannot but think it is very closely connected with it. To my mind it is so much like *Cattleya Wallisii*, the true pure white form, that it is difficult to tell the two varieties when severed from the plants.

I remember the late Mr. G. Toll, whose knowledge of varieties of Orchids was so extensive and wishal so clear, that very few ventured to question the accuracy of his opinions, showing me two plants he had in his nursery, and always spoke of them in the highest terms of approbation and delight. I remember, too, that when his plants were sold some two years ago a good plant of *C. crocata* was knocked down to Mr. Riley, of Burnley; when, however, at the close of the sale the plants came to be delivered, this identical plant could not be found. A reward for its recovery was offered in the *Manchester Guardian*, describing the plant and number of the lot; but so far as my knowledge goes, nothing further was ever heard of the plant. This plant was true, had flowered once or twice, healthy and vigorous, with two or three leading growths.

In the number of June 19 (p. 799), M. J. O'Brien says:—Mr. Gaskell has a delicate rose-coloured form of it (*C. crocata*?). I send you a delicate rose-coloured form of *C. Eldorado*, which I fear is confounded with *C. crocata*. This bloom much resembles *C. crocata* truly, but it is just a variety of *C. Eldorado*, and might just as easily be termed a rose-coloured form of *C. Wallisii*. In the *Orchid Manual* referred to, on p. 207, I find the name of *C. Virginalis*, Linden et André; the description of this variety is so similar to what might be affixed to *C. crocata* as well as *C. Wallisii*, that I think it would be extremely difficult to distinguish one from the other. Still I am not prepared to say that they are all one and the same thing. The plant from which the bloom of *C. crocata* was taken is now blooming with several spikes, two flowers on a spike. The flowers are not so erect as *C. Wallisii*, nor are the bulbs so stout, and the leaves, which are more rounded at their tips than *C. Eldorado*, are not so straight and erect as that species, but bent over more like some forms of *C. speciosissima*.

I send you also a fine form of *C. Gaskelliana*, 8 inches across, deep in colour, very broad expanded lip of the deep rosy-purple, covering the entire portion of the labellum. *W. Swan*.

GARDENS, ALLOTMENTS, AND SMALL HOLDINGS FOR LABOURERS.

We have lately seen several highly coloured representations, from a gardening point of view, confidently setting forth the national prosperity which would surely follow the wholesale establishment of small holdings to be taken up by agricultural labourers. In connection with this subject it will be well to consider a few of the difficulties with which the occupiers will have to contend, and to ask ourselves the plain question whether or not the adoption of small holdings, excepting under favourable circumstances, will prove beneficial or otherwise?

If the now strictly agricultural farmers are going to turn their attention to the production of vegetables for market and still continue to use the plough as a means of cultivation, will it be possible for men in small holdings, with land under spade cultivation, to compete favourably in the open market with their produce against the fast increasing number of market garden farmers growing crops on a much larger scale, and having the advantages of improved implements worked by horse or steam power? If thousands of small holdings are going to be allotted out will not their produce, added to the present and rapidly increasing supply of home-grown and foreign vegetables and fruit, quickly exceed the demand? I think the answer to this must be in the affirmative. At any rate, it can at the present only be answered, even by our best informed authorities, theoretically. No one is prepared to say that a limited number of small holdings, relying mainly on the sale of garden productions, would not prove profitable investments in the hands of industrious men, providing the same could be obtained in the neighbourhood of populous towns, where the transit of fruit and vegetables, without much expense in packing, could be easily accomplished to the nearest market,

It takes a longer period of time to successfully develop an horticultural undertaking than an agricultural one; hence the necessity for the occupant to

lay the foundations from which in a great measure would spring his ultimate success. Admitting that many would, in all probability, be able to secure a lease as a further inducement for labourers and others to invest their small capital and labour in small holdings, are we to look upon this movement as a sure cure for the present depression? No; I am inclined to think, as many others do, that only under special circumstances will they be found to answer expectations. Let us now enquire what the newly-created peasant proprietor is going to grow when he becomes securely established in his holding, of such quality as would bear favourable comparison with productions seen daily in our central provincial markets. He would probably excel in the growth of such kinds of vegetables as he had been accustomed to grow for home consumption in his previous home cottage garden or allotment. In the main these would be Broad Beans, Cabbage, Carrots, Onions, Peas, Parsnips, Potatoes and Turnips. The cultivation of choicer and better class vegetables from a market value being rarely attempted. Will an extensive cropping of such give him when marketed a fair return for the land on which they grew and his labour? From my experience they certainly will not, as most excellent samples of all these kinds of vegetables can be produced under a system of deep-plough cultivation by the larger market farm gardener. The latter, when he further turns his attention to this recent help to pay rent more extensively, would have many advantages over the man in a small holding, even if he succeeded in making two blades of grass grow where only one formerly grew.

What measure of success he would meet with following the occupation of a small farmer I am not in a position to say, but the present state of agriculture may be taken as a criterion as to this. If the labourers had only a superficial knowledge of gardening, which would certainly be the case, many would ultimately learn more by a succession of banglings, therefore the undertaking at the commencement would be more speculative than useful. But how many would be able to withstand this temporary state of affairs without running themselves seriously into debt in providing themselves and family with the other necessities of life. I am now alluding to men who would probably give up going out to work for a daily wage, and undertake small holdings with the scanty knowledge gained from observation and experience simply in their cottage gardens. The supporters of this movement will naturally expect (and so will employers of labour) that a man when in possession of a small holding would be quite independent of him finding sufficient work (no doubt exists about this) and profit in connection with his holding for the support of himself and family. If it were otherwise he would have done better to remain as before—a day labourer, as his interest and the interests of a labour master would be distinctly antagonistic. When the latter required his (the labourer's) services it would often happen that he had work at home, or *vice versa*. The end of this would be that when he had not employment at home he would have to tramp the country in search of it. If small holdings cannot become remunerative from an agricultural point of view I think it is equally certain that they will not, from an horticultural standpoint, unless they are in the hands of men who have moved about the country a bit, and have become conversant at least with the rudiments of market garden work, and men who possess some knowledge and forecast to enable them to realise the best prices, according to season, for what they grow. I think it is apparent that if success is to attend this great movement too much reliance should not be placed on the gardening part of the undertaking.

Should many of these forthcoming small holdings result in failures—let us hope they will not—the aspirations of many labourers will have been gratified so far as a trial goes. By their failures they will have learnt what the difficulties of others must be who are engaged in similar occupations upon a much larger scale. They will then return to their old employment as day labourers again free from the many anxieties which attended them when thrown entirely on their own skill and resources and when they have found out by experience that there is something more than manual labour required to successfully manage and make the land pay.

It is much easier for a man to learn the management of a small stock of animals, and a little land for their maintenance, than for him to become suddenly a

FIG. 68.—FERULA GLAUCA AT CHELSEA (SEE P. 335).

obtain a long lease on his premises. Remaining simply as a yearly tenant would not be an adequate guarantee, from a horticultural point of view, for him

qualified market gardener, able to produce such samples as would meet with a ready sale in these days of keen competition.

By contributing these few remarks, I do not wish to be understood as in any way underrating the great national importance of establishing as many permanent tillers on the laod as it is capable of supporting. But when such a great movement as this is contemplated, and is now pending in the balance, for better or for worse, it is interesting before its final solution, to discuss the subject in all its bearings. *One who Markets.*

BRITISH ASSOCIATION.

PROFESSOR BOWER opened the business in the Biological section on Tuesday last with three

would deny the theory that the ants benefited by the relationship, though the converse proposition was not so clear. In some cases the ants were known to protect the plants by driving off other insects, and Beccari pointed out that the plants derived nutriment from the excreta of the ants; but that was a view open to considerable discussion. The conclusion he (the writer) had come to was, that the ants alone were benefited by the connection. Not only were they by this means provided with a capital lodging, but it might fairly be assumed that they derived food from the plants.—In the course of a short discussion, Dr. Trimen said that the ants took advantage of the hollowness of the plants, but he did not think the latter derived any benefit from their presence.—The other papers contributed by the Pro-

period. The cause was that there was no safe apparent guide as to the exact ripeness of the leaf. The colour of the leaf failed to afford that information, and the fall of the leaf was no guide. His method of experiment had been to tie the leaves to the twigs, so that when the former gave way they were suspended by the twine. If the fall occurred during frost or windy nights the leaves were discarded, only those being selected that apparently fell in perfect maturity on a comparatively still and not frosty night. The subject had been approached from two points of view—the mechanism of leaf-falling and the transfer of the cell contents from the leaf to the stem, the former dealing with the power of the leaf itself and the latter with the amount of loss that took place to the plant itself by the fall of leaves over and

FIG. 69.—THE STATUE OF SIR HANS SLOANE, CHELSEA. (SEE P. 336)

papers. The first related to the plants which furnish a residence for ants. The peculiar relation between plants and ants, he observed, had been the subject of considerable observation from time immemorial. The literature on the subject could be traced as far back as 1750, and Captain Cook, in describing his voyage, distinctly alluded to the matter.

In one place he pointed out that on a tree he saw a number of black ants, which perforated the twigs, and, after eating out the pith, formed a lodging in the cavity, and yet the tree continued in a flourishing condition. In tropical climates there were many plants pre-eminently associated with ants. The Italian botanist, Beccari, contended that the relationship was advantageous alike to the plants and the ants. The former afforded shelter for the latter, and in some cases supplied them with food. No one

professor were on "Positive Geotropic Shoots in Cordylice," and on "Apospory in Polystichum angulare."

POTATO DISEASE.

Professor Marshall Ward, in a contribution on "The Germination of the Spores of Phytophthora infestans," explained the method by which these spores grew so rapidly, and how it was that when the disease appeared among Potatoes it was apt to spread very quickly throughout the crops of the country.

THE FALL OF THE LEAF, ETC.

Professor Hillhouse, in a paper entitled "Preliminary Note on the Falling of Leaves," said he had taken observations on this subject every autumn since 1882, and hoped in the course of twelve months to complete them. At first sight it might seem peculiar that a question of that kind should be spread over so long a

above the actual skeleton, so to speak, of the leaves themselves. He found that the leaf fell from the increased turgidity of the cells, which became strongly rounded, greatly diminishing their adhesiveness. The turgidity appeared to arise from the root-absorption of water continuing at a greater pace than the leaves could pass the water off, so that the accumulation of water caused an expansion of the tissue, consequently the cells became rounded, and disconnected. Tannin and starch were especially abundant in the layer at the base of the leaf-stalk, but in naturally fallen leaves starch was rarely found, except at the very base of the stalks, and then in small grains. Professor Hillhouse afterwards described an apparatus for determining the rate of transpiration in plants. He observed that no apparatus having been devised for the purpose above named, he had experimented with an apparatus of his own construction.

Professor Hillhouse showed the workings of the apparatus, and the minute records made of the transpiration of plants.

GERMS.

Dr. Percy Frankland contributed a paper on "The Distribution of Micro-organisms in the Air of Town, Country, and Buildings." It contained the results of a number of experiments which the author had made on the relative abundance of micro-organisms in the air of different places, and of the same place at different times. In these experiments the number of microbes contained in a given volume of air had been supplemented by the determination of the number falling upon a unit of horizontal surface (1 square foot) in a unit of time (one minute). The air on the roof of the Science Schools at South Kensington was very considerably richer in micro-organisms than that collected in the London parks, and this again than that of the country. The gradual attenuation of the microbes in ascending St. Paul's and the spire of Norwich Cathedral was also very striking. The figures obtained in museums, railway carriages, and hospitals for consumption showed how in confined spaces the number of micro-organisms present in the air was influenced by the number of persons moving about.

CONFORMATION OF CYPRIPEDIUM.

Dr. Masters sent a note on the "Floral Symmetry of the Genus *Cypripedium*." In this note the author adverted to so much of the normal structure of Orchids in general, and of *Cypripediums* in particular, as was necessary for the elucidation of his subject, and proceeded to describe a case of regular poleria in *Selenipedium caudatum*, which showed a reversion to the typical form of Orchids, and went to prove that the so-called genus *Uropedium* was only a perlorin form of *Cypripedium*. The construction of the androecium in these plants was then alluded to, and illustrations given of the presence of from one stamen only to that of six stamens in two rows, of all intermediate stages, that is, from monandry to hexandry. The frequently observed tendencies to a dimerous condition, and to the development of the inner row of stamens, were also alluded to, and the significance of these changes pointed out. The morphological changes consequent upon hybridisation, and the inferences to be derived from them, were passed under review, and the paper concluded with a general summary of the teratological changes observed in the tribe *Cypripediceæ*.

SEEDLING FERNS.

Mr. J. Morley contributed a note on the cultivation of Fern Prothallia for laboratory purposes. He remarked that amongst British Ferns the spores most easy to germinate are those of *Osmunda regalis* and *Luzula siliqua*. Rather less easy are those of various species of *Polystichum* and *Adiantum*. To collect the spores, lay the frond, when the sporangia are dark brown, between sheets of unglazed paper, and keep dry till wanted. The spores would fall into the paper, and when wanted tip off all that were loose. The spores could be grown on pieces of sandstone, slate, peat, &c., but whatever the growing medium it should be previously sterilised by pouring over boiling water.

Florists' Flowers.

CARNATION SOUVENIR DE LA MALMAISON AT RANGEMORE.

SEVERAL of your readers will remember the fine display of *Souvenir de la Malmaison* Carnation at Mr. Jennings, of Ascot, Leighton Buzzard, made at the Royal Horticultural show at Liverpool a few weeks ago. During the past two months, those who have visited Lord Burton's, Rangemore, Burton-on-Trent, have seen a most striking display of the same Carnation. Mr. Bennett had arranged the middle staging of a span-roofed house entirely of *Souvenir de la Malmaison*, between 400 and 500 plants, averaging from five to ten blooms on each plant. In the centre of the stage he had some noble flowered plants of the red variety, known by many under the name of Madame Blechroder. Those who grow Carnations should not fail to obtain the red variety, it is a very pleasing contrast to the pink.

The house of Muscat of Alexandria at Rangemore is again this season a grand sight, the bunches and berries are everything that could be desired. *H. J. C. Highgate.*

COLONIAL NOTES.

THE FALKLAND ISLES.

THERE is certainly a remarkable contrast between this place and Seychelles in the way of vegetation. There's the most redundant tropical growth, here all as bare as your hand. It is about this very bareness that I am going to trouble you. I am very anxious to try and grow some hardy bushes and shrubs here; and in sheltered spots they will grow I know, to a certain height, though I doubt if one could expect anything above 12 or 15 feet at most. Still this would be something better than "diddle dee" and "Bismam bog." Could you advise me what to try, and perhaps send me a few seeds or roots, with directions as to the best way of managing them. I have a good gardener here who was at Paul's Nursery Garden, and will take pains with plants. The soil, as of course you know, is chiefly peat, and the winds are high and cold. The latter, I suppose, would always prevent trees of any size growing. But it is wonderful what can be done here in sheltered spots, and the flowers do capitally. I have never seen such Pansies, Pinks, Picotees, &c., as are grown here. Fruit seems to degenerate—Strawberries, Raspberries, and Currants, all get small by degrees and beautifully less, year by year. So far as I have yet seen, the climate has been too much abused, chiefly by people who, like Sir Wyville Thompson, happened to come here during bad weather. It is now over three months since my arrival, and I find from my journal that more than half the days have been fine and calm, and when it is fine it is lovely—like spring weather at home. To be sure it does blow "whites," and snow, too; and, unluckily, visitors generally arrive when it is doing one or the other, or both, and at its best it looks a little bare and dreary, but would be vastly improved if a few nice evergreen bushes and shrubs could be induced to grow here and there in sheltered places. About the town I do not see why Laurels, Hollies, &c., should not do, but I should be very glad of your advice and assistance to think of me. *Extract from letter from Hon. A. C. Barkley, late Commissioner at the Seychelles, now Acting Governor of the Falkland Islands, to Mr. W. T. Thistleton Dyer, F.R.S., C.M.G., Director, Royal Gardens, Kew.* [We should be glad of suggestions. In the meantime the system of procuring shelter in the first instance, and then of growing plants which will withstand sea breezes and a cold temperature might be tried. Tamarik, Tussock-grass, Gorse, Austrian and Corsican Pines, Griselinia, Hippophae, Escallonias, and hosts of hardy shrubs would probably thrive, once shelter were obtained. Ed.]

The Flower Garden.

VIOLETS.

IN late localities, which are liable to early frosts, no time should be lost in having winter Violets transferred to their blooming quarters; in more favoured localities this may be deferred for some little time. The most suitable place to bloom Violets successfully is one with a south or south-west exposure, where every ray of the sun can strike the frames. I am not an advocate of using fermenting material underneath the plants; this has a tendency to weaken the plants, and small blooms are the result. There is also a large amount of moisture to contend with in the frames, and damp is the worst enemy that attacks the Violet in winter. My practice is to fill up the frame to within 9 or 10 inches of the top with spent leaves from old hotbeds; this secures ample drainage for the plants, and there is not sufficient heat to injure them. This is trodden down as hard as possible, to prevent subsidence. The plants are fitted with as large balls as possible, 9 to 10 inches in diameter; the balls are stood on the leafy bottom,

and the spaces between the balls are firmly packed with fine compost of a light nature. As soon as the pits are filled they receive a good soaking of clear water, and the sashes are kept off until frosts set in, or heavy falls of rain take place. A good surfacing of Cocoa-nut refuse helps to ward off damp, and also serves to keep the rain from washing the soil up on the flowers and foliage of the plants.

BULBS.

In order to secure the pick of bulbs for planting the flower-beds next month, no time should now be lost. It is false economy to spend money on cheap articles of this sort, as much disappointment will be the result. See that the bulbs are firm and well matured about the crown; if they feel soft they will not give satisfactory results.

ALPINES.

Many of the more delicate alpine plants in pots should now be placed under protection in such structures as it is intended to winter them in. With regard to these plants, especially those which are natives of barren or rocky situations, the coverings should not be placed over them unless to shield them from excess of wet; if they receive too much cooling they will become weak and less able to withstand the dull months of winter. Where any are observed to be too wet they may be turned over on their sides for a time to drain. Wherever watering is necessary worms are not long in making their way towards it. The pots should be frequently watered with lime-water, and occasionally the occupants should be turned out to see that the drainage is all right.

HERBACEOUS PLANTS, &C.

Continue transplanting hardy perennial and herbaceous plants which have been raised from seed and cuttings. Any of the latter which have not attained sufficient size and strength may be left till spring, otherwise they may perish during the winter, should the autumn not prove favourable for their establishing themselves in the beds or borders. Continue putting in cuttings of *Pentstemon*, *Phloxes*, or any other thing of which it is desirable to increase the stock. Pansy cuttings may be put in, in quantity for early blooming in pots. Such as are rooted may be planted into good light soil. Avoid the use of strong rank manure at this season of the year. *W. M. Baillie, Luton Hoo.*

THE ORCHID HOUSES.

CATTLEYA GIGAS.

This Orchid with its many varieties or synonyms has been written about often and directions given how to induce it to flower. I think most people advise hanging it near the roof glass, but this is not always practicable if you have many plants and they happen to be in large heavy pots. That being the case, the system adopted here will be found more convenient. Our idea is that if *C. gigas* can be kept from starting very early in spring it will only make one growth in a season; this will keep it strong, therefore more likely to continue flowering. When it commences to grow give it all the sunlight possible and little fire-heat, the early morning temperature during the month of March is often down to 50°. To follow out this plan the plants are placed on a stage in a small division at the south end of the Cattleya house, the boilers being at the north end, the shading is made to roll on the roof and the end of the house is left unshaded.

Plants of *C. gigas* have been grown in suspended baskets; these flowered very well, but began to grow weak after two or three years. A very good time to pot this Cattleya is just as the new growth begins to throw out fresh roots; this it commences to do a week or two after the flower is past. The pot can be placed in a larger one if it is not necessary to turn the plant out to put it in better form. A thin shading might be used for those plants that have been turned out of their pots. Very little water is necessary after the bulbs have done growing.

The fine summer weather that we have been having will greatly assist all Orchids in making firm growth providing they get sufficient air. Do plenty of damping down through the heat of the day, and less in the evening when the houses are closed. We may expect sudden falls of temperature during the present month, and this often happens when there is very little fire-heat, and if the East Indian houses are

heavily charged with moisture while the temperature is low sport in the leaves often follows. Begin to ventilate warm houses that were closed over night by six A.M., if the weather is mild and the temperature in the house rising. *C. Woolford, Downside.*

PLANTS AND THEIR CULTURE.

CAMELLIAS.

Now that the growths of these are being hardened and the flower-buds formed and showing themselves prominently, there is little fear of the plants getting excited into growth. Should any of the plants in pots show signs of weakness this is the best time to shift them; but never shift unless it is required, as by giving a shift of a clear inch all round the ball, using good tough fibrous peat and a third of fibrous loam, plenty of sand, and a sprinkling of small bones, it will last a long time. If this be done the compost should be rammed in firmly, but do not carry this to the extreme, as when potting *Ericas*, &c.

BULBS.

Gladiolus The Bride should be grown in quantity, as there is nothing more graceful than this, especially where large quantities are required during the London season for furnishing and decorative purposes; the spotted varieties of the early sorts stand pre-eminent, of which delicatissima, *Mary Anderson*, *Rosy Gem*, and *Princess Beatrice*, are special favourites. *Allium neapolitanum* does well in pots, and will be found useful for bouquets, &c. *Freesia refracta alba* is another beautiful thing for cutting.

A batch of *Sparaxias*, *Lisias*, and *Tritionas* should now be potted up with a second batch of Roman *Hyacinths* and as soon as the *Belladonna* and *Guernsey Lilies* can be obtained they should be potted in good rich soil, slightly watered, and placed in a warm pit. The general bulb order should be made up at once, if not already done. The earliest varieties of *Hyacinths*, *Tulips*, and *Narcissus* should be potted up first, and then a second potting should be made; in this way the blooming season is much prolonged. *Hyacinths* of the single varieties will be found much more useful than the double. The following varieties I have found to force well:—*Princess Beatrice*, *Mont Blanc*, *Royal Bride*, *White Perfection*, *Grand Vidette*, *La Grandeur*, *General Felsier*, *Homerus*, *L'Ami du Cœur*, *Fabioli*, *Queen of Hyacinths*, *Prince of Wales*, and *Solfaterre*. Of *Tulips*, the *Duc Van Tholls* will be found very useful for early work. *Polyanthus Narcissi* are fine decorative plants, particularly suitable for pot culture; these, with their large trusses of sweet-scented flowers, the double Roman *Hyacinth*, and the paper-white *Narciss* come in very early. All these should have attention, and if they show the least signs of being exhausted remove as much of the soil as possible without breaking or disturbing the roots to any serious extent, replacing it with the compost given for *Camellias*. See that the borders and pot plants are thoroughly soaked through the ball, before operations commence. Plants which are outside, if at all exposed, should be securely staked; generally about this time of year we get some strong west and south-west gales, often breaking the plants by blowing them down. *A. Evans, Lythe Hill.*

HARDY FRUIT GARDEN.

PLANTING FRUIT TREES.

THOSE who intend planting this autumn must now commence the preparation of the soil. The present time and the early part of next month are the best periods in which to get the ground trenched in readiness for planting in October. Taking into consideration the number of years that most fruit trees remain on the same site in our gardens, after being planted, it will only be opportune at this season to point out the great importance of planting at the right time, in the right soil, and in suitable positions. Before purchasing the trees, the soil should be in readiness to receive them, and if this work cannot be carried out in time to get them planted by the end of October, well, don't plant until the early spring months. The importance of planting just before root-

action is at a standstill, or just as it commences in the spring, is now so well recognised that but few trees are plunged into the cold soil during winter.

The nature of the growth made by fruit trees growing in similar soil, in proximity to where the planter anticipates planting fresh ones, should form a guide as to the treatment of the soil before planting, viz., whether fresh soil should be added to that already present, or whether only a thorough working of the latter is necessary. It is folly to plant, for planting sake, unless one can feel assured that everything has been done to ensure success, by adding opening material if the soil is of a too adhesive nature, or by applying some heavy soil if the ground to be planted should be of a poor sandy character, and, above all, to have a sufficient depth of each for the roots to ramble in, resting on perfect drainage, natural or artificial. These are the most important points to be studied to ensure the formation of healthy roots of the right sort. When planting in old garden soil highly charged with humus, the best thing to add to it is some fresh loamy material, or the best that can be obtained in the locality, just to infuse a little of the exhausted virgin qualities into the old soil again. This is far better than the application of manure of any description. The siftings from rubbish heaps, after being charred, may be mixed with stiff maiden soil with great advantage. There are varieties of *Apples* and *Pears* (and the same remarks apply to other hardy fruits) that succeed much better in some districts than others; therefore the safest guide, as to the selection of varieties, is to choose from those which appear to afford the best crops in the neighbourhood. But the planter should not be deterred from obtaining other varieties, planting them sparingly until their adaptability has been proved. *S. H. Richards, Somerley, Ringwood.*

FRUITS UNDER GLASS.

PEACHES.

AS soon as the crop has been taken from the trees clear out the houses of nets, &c., and give the borders a thorough watering, and the foliage a good syringing with clean water every afternoon during bright sunny weather, so as to dislodge any red-spider that may be present, by that means retaining the foliage till it has performed its proper functions.

EARLY HOUSES.

Trees which ripened their crops early in May will ere this have shed their leaves, therefore the thinning and shortening of the shoots should be proceeded with at once. I need scarcely say that as much of the old wood as can be dispensed with should be cut out, as well as superfluous young shoots, and some of those left should be shortened back to a wood-bud where necessary, to secure balance of growth. This object should never be lost sight of in pruning any tree. The shoots should be thinned out to 6 inches apart, and if necessary be washed with a weak solution of soft soapy water, using a brush sufficiently stiff to remove any scale that may be on them, taking care in doing so not to injure the buds. Then, having previously thoroughly cleansed the house, train the shoots to the trellis at the distance indicated above, and at the same angle on either side the centre of the tree. This done, remove the loose surface soil from the borders, replacing it with a mixture of good turfy loam and one-fourth part of old lime rubble and wood ashes, following this with a mulching of horse-droppings to the thickness of two or three inches, and a good watering of the border with clean water. Leave the house open day and night until the time arrives for starting the trees. In thinning the shoots those of medium size, well-ripened, studded with buds, should be retained in preference to others of stronger growth.

LATE HOUSES.

Trees that have shown signs of distress in swelling their crops should have their roots seen to as soon as the fruit has been gathered. Open a trench about 2 feet wide also the same depth at 3 feet from the base of the trees operated on, afterwards working the soil away with a four-tined fork from underneath the trees until plenty of roots are reached. These should be shortened back and the space refilled with a mixture similar to that advised for top-dressing,

and the trees should be shaded from bright sunshine for a week or ten days afterwards, and be syringed overhead in the afternoon with a view to retaining the leaves on the trees until the roots have pushed into the new soil, and so re-established themselves before shedding their leaves. In the case of worn-out trees they should be removed forthwith, and be replaced by young ones from the walls in the open, and afterwards be treated as recommended above. *H. W. Ward, Longford Castle.*

The Kitchen Garden.

ARRAIRS OF WORK.

THE present time being one when there is generally less stress of work than at any other period during the year, a little time and attention should be afforded to any details that may have been allowed through over-pressure of more important matters or other causes to have fallen into arrears, and to endeavour, as far as possible, to rectify and make good any deficiency where practical, both as regards the various crops and requirements, and also in the thorough overhauling and clearing up of waste places, garden-refuse, out-of-the-way corners, or any other sources of rubbish which have been allowed from one cause or another to accumulate; these should be collected together, a fire made, the basis being formed of some good logs of wood, and the whole thoroughly burnt over, and afterwards well mixed together, a portion being screened whilst dry, and stored in reserve for dusting purposes. By thoroughly burning up all these seeds and roots of weeds that may have found their way to the rubbish-heap are effectually destroyed, and the residue becomes a valuable ingredient in the preparation and amelioration of heavy soils, and also as a top-dressing, alone, or incorporated with some artificial manure; care should therefore be taken to accumulate for that purpose all the burnt refuse and wood ashes, &c., that are obtainable.

SEEDS AND CROPS.

The results of the present season should be noted, as regards the quality of the seeds sown, and also with reference to the individual merits of the different varieties grown, and their adaptability to the soil and locality, in order that corrections and suitable selections may be made for another season. Amongst Peas, in particular, there is a wide difference of opinion as to their respective merits and demerits, which is probably more to be accounted for by climatic influences than by any real defects or objections in the individual varieties, the appearance, crop, and also the flavour, depending in a great measure on the health, vigour, and free doing of the plants, and to their receiving no check throughout; last season with us nothing could have been more satisfactory, or given better results, than the varieties *Telephone*, *Telegraph*, and *Giant Marrow*. This season they have almost proved a failure, and after the first and second earlies, *S'ratagem*, *Veitch's Perfection*, and *Ne Plus Ultra*, have withstood the drought, and consequently mildew, and produced better crops than any other varieties.

GENERAL WORK.

Prepare a plot of ground for planting out the main crop of spring Cabbage; this should be well manured with good rotten dung, and after being dug in, allowed to settle down a few days, and made firm before planting. If plentiful, the small and earlier varieties, such as *Wheeler's Imperial*, &c., may be planted in shallow drills, 9 inches apart and 18 inches asunder, every alternate plant being drawn in spring for early use, and before they become overcrowded, larger and later varieties, such as *Enfield Market*, &c., should have a space of from 18 inches to 2 feet each way; and do not allow the young plants to become drawn and weakly in the seed-beds, rather than this should occur prick out on temporary beds until their permanent quarters are ready to receive them. Heaps of manure that have laid any time on hard should be turned over and prepared ready for use; and where the supply is short, no time should be lost in getting some together in readiness for autumn and winter ground work. Continue to earth up *Celery* in dry weather, also *Leeks* in trenches, and thin out and weed such advancing crops as *Turnips*, *Spinach*, &c. Lift and store *Potatoes* as they become ready, and when in a dry state, the haulm being collected together and burnt if there is the slightest symptoms of disease. *John Austin, Witley Court.*

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, Sept 13	Sale of Dutch Bulbs and 1000 Tuberoses, at Protheroe & Morris' Rooms Sale of Bulbs from Holland, at Stevens' Rooms
TUESDAY, Sept. 14	Annual Trade Sale of Plants, at the Burnt Ash Nurseries, Lee, by Protheroe & Morris Sale of Bulbs from Holland, at Stevens' Rooms
WEDNESDAY, Sept 15	Annual Trade Sale of Plants, at the Lea Bridge Nurseries, Leyton, by Protheroe & Morris Sale of Flowering, Semi established, Orchids, in variety, at Stevens' Rooms Annual Trade Sale of Plants, at the Brunswick Nurseries, Tottenham, by Protheroe & Morris
THURSDAY, Sept 16	Sale of Dutch Bulbs, at Protheroe & Morris' Rooms Annual Trade Sale of Plants, at the Longlands Nurseries, Sidcup, by Protheroe & Morris
FRIDAY, Sept 17	Trade Sale of 4500 Established Orchids, without reserve, at Protheroe & Morris' Rooms Trade Sale of Plants, at the Dyson's Lane Nursery, Edmonton, by Protheroe & Morris
SATURDAY, Sept 18	Sale of Dutch Bulbs, at Protheroe & Morris' Rooms Sale of Dutch Bulbs at Stevens' Rooms

THE PHYSIC GARDEN at CHELSEA has special claims on the sympathies of botanists and horticulturists. Established soon after the middle of the seventeenth century by the Society of Apothecaries of London for educational purposes, it is associated with such names as SLOANE, PHILIP MILLER, who here received the visit of LINNÆUS, WILLIAM CURTIS, of *Botanical Magazine* fame, N. B. WARD, JOHN LINDLEY, ROBERT FORTUNE, not to speak of others still living. The history of the garden has been told in our columns before now, and those who wish to read of its chequered fortunes cannot do better than procure Dr. SEMPLE'S *Memorials of the Botanic Garden at Chelsea*. Our present purpose now is rather with the garden as it is than as it was. Small in extent, low-lying, close to the river, built in by tall houses, surrounded on three sides by a dense population, and plentifully endowed with the smoke and dust of the huge metropolis, this garden might be thought to be of little worth, and to owe what interest attaches to it rather to the past than to the present. But this would not be a just estimate. The Chelsea garden still fulfils its purpose, and in some respects better than ever, while, owing to the additions made a few years back in consequence of the new Embankment, its size has been increased and its general condition improved.

Owing to recent changes in the curriculum of medical education, botany which, from the time of ÆSCULAPUS downwards, had been inseparably associated with medicine, has now been in a measure divorced from it. Of course there were good reasons for lightening the confessedly overburdened programme of studies for the medical student. Doubtless, too, the method and style of botanical teaching were not always in consonance with modern notions, and with the increased attention now paid to the microscopic structure and to the physiology of plants rather than to their outward conformation and natural affinities. All this may be admitted, but constitute, in our judgment, rather an argument for modification than for the abolition of botanical teaching as an element in medical education.

In these pages we cannot enter into the discussion of what might be done at once to lighten the programme, and to render it more in accordance with the requirements and the fashion of the day, nor can we discuss the desirability of including a full practical course of botanic teaching as an essential preliminary to more strictly professional studies; but we may at least express our opinion, that the utter abolition of botanical teaching is a mistake and a calamity for medical science. It has come, too, at a time when, to a degree, never equalled before, the life-history of plants is shown to be of cardinal importance in understanding the physiology of animals, the natural history of many diseases, and the method of combating them. The Society of Apothecaries has always held a juster conception of the value of botany in

medical education not only for its direct advantages, but also for the excellent training of the observant and reflective powers that it offers, and which render it so valuable as preliminary to the study of medicine. It is hardly likely that the Society will alter its well matured plans, and hence it may well be that the Society will become the sole teaching body of botany in its relation to medicine.

At the present time the Society offers medals to medical students for proficiency in botany—medals which have always been highly reputed among students, and which have been competed for by many of our leading medical men and botanists. Similar prizes are offered for competition on the part of young women, destined, it may be, for the profession of governess. These latter examinations, which are of an elementary, though practical character, are open to young girls throughout the kingdom, and are well attended. In addition to this, during the summer months, Mr. J. G. BAKER gives a course of botanical lectures which are highly appreciated, as may be judged by the well-filled lecture-room.

To provide for these requirements, as well as for the supply of specimens at the periodic examinations of students at the Hall is one main object of the Chelsea garden.

The cultivation of medical plants and of specimens adapted for teaching purposes, therefore, takes precedence over the growth of ornamental plants, though these latter are by no means neglected. The garden is a square enclosure bounded by high walls which afford shelter for many curious plants. The outdoor plants are arranged in their natural orders, and those that require more attention are cared for in some old-fashioned lean-to houses, in a central span-roofed range, in a north-east house, and in various pits and frames. In the middle of the garden is a circular aquarium, surrounded by rockwork with dense masses of *Acantholimon glumaceum*, *Genista tinctoria*, and many other plants, including a large bush of the rare *Astragalus pseudo-Tragacantha*, whose pink flowers are set down in the axils of the pinnate leaves, the midribs of which are persistent and become hard and thorny. Near to it stands a statue of the garden's greatest benefactor, Sir HANS SLOANE. The stone is mouldering away rapidly, but the inscription being better protected, is still plainly legible, and sets forth not only the gratitude of the raisers to their benefactor, but expresses also their sense of the relation of botany to medicine—thus it runs:—

"THEY
being sensible how necessary
that Branch of Science is
to the faithful discharging the Duty
of their Profession,
with grateful Hearts
and general Consent
ordered this statue to be erected
in the year of our Lord, 1733,
that their successors and Posterity
may never forget
their common Benefactor."

Another monument of a different character is afforded by the old Cedar, the survivor of four, of which three have long since been removed. Of the two which once flanked the river gate, one has disappeared, and the other keeps on a lingering existence. These Cedars were planted in 1683, and long constituted a special feature of the garden. The surviving tree is flat-topped, and its bole has now a girth of 12 feet 10 inches at 5 feet from the ground.

The glass houses make no pretence to be show houses, but go when one may one is always sure to find something of interest. We have selected some instances for illustration such as the *Xanthochymus pictorius*, an evergreen shrub with bold shining green foliage, and which bears each year its yellow edible fruits, much esteemed by the natives of Central

India (see figs 71, 72). This is a plant nearly allied to the *Garcinia*s which produce gamboge and indeed itself yields that gum. It is a striking plant not often seen out of a botanic garden, any more than the Dumb Cane, the Mango, the quaint *Dorstenias*, the *Cinchonas*, the weird *Stangeria*, the Betel pepper, the tall Aloes, the Candle tree, and dozens of plants of medical or botanical interest. *Pelargoniums*, including some of Dr. DENNY'S seedlings, *Fuchsias*, and *Calceolarias*, serve to keep the houses bright.

The north-east house is given up to Ferns and other plants disposed in beds amid masses of rock, including *Camellias*, *Roses*, *Clematis*, and *Hellebores*, of which latter genus there is an interesting collection. *Saxifraga petalota* shares with the plants just named the shelter of this house. That Ferns should be well represented in this garden is not to be wondered at, for among living *Pteridologists* there is none to surpass the Curator. Other houses contain good examples of *Monstera deliciosa*, the *Sycamore Fig*, *Ruscus androgynus*, a collection of succulents, and other interesting plants.

Among the trees, in addition to the Cedar before mentioned, are an old Ginkgo, or Maidenhair tree, a fine evergreen Oak, a Hickory, a white Poplar, a *Ptelea*, a *Planera*, a *Kœreuteria*, &c. *Hablitia tamnoides* may be also mentioned as a very free growing climber, with rich green foliage and profuse clusters of yellowish flowers. It is evidently an excellent plant for town gardens. *Roses* do not fear to display themselves, and *Rosa rugosa* in particular asserts its right to be considered a good town plant. Of herbaceous plants there are many, and those well selected, considerable space being devoted to those of medicinal interest. *Ferulas* have been long a fancy of the Curator, and years before subtropicals and bold plants of that character were fashionable, their merits were recognised and recorded by Mr. MOORE. Our illustration of one species, *F. glauca* (fig. 68, p. 332), shows how fine they are, but it cannot show either the rich green of the young foliage, nor the golden yellow of the leaves in their decay. *Rhubarbs*, including the medicinal species, are strikingly handsome, and equally imposing are the giant *Heracleums*. *Yuccas* flourish well, and single *Dahlias* are known to be a hobby of the Curator's, but we will not be led on to write a catalogue, we have said enough to show how much interest attaches to the old garden. Those who remember, and there cannot be many who have forgotten, the services to horticulture of Mr. THOMAS MOORE, and who miss his presence and feel the want of his unrivalled knowledge of plants at our horticultural gatherings, will join us in the hope that he may speedily be restored to health, and aid us as before with his ripe counsels, full knowledge, and excellent judgment.

—ROYAL HORTICULTURAL SOCIETY.—At a meeting of the Fruit and Vegetable Committee, held at Chiswick on September 8, present, John E. Lane, Esq., in the chair; Messrs. Woodbridge, Norman, Smith, Saltmarsh, Paul, Burnett, Silverlock, and Miles, the collection of Potatos growing in the Garden was examined, and, on being cooked, First-class Certificates were awarded to the following varieties:—

Frye's Flower (R. Farquhar, Aberdeen).—White kidney, rough skin, yellow flesh, medium-size; heavy cropper.

Seedling A 1 (A. Harris, Woburn, Beds).—Large white kidney, smooth skin, white flesh; good cropper.

Bouncer (T. Laxton, Bedford).—White round, smooth skin, white flesh, very handsome; moderate cropper.

Magpie (J. Murdoch, Rothiemay, N.B.).—Large white round, smooth skin, white flesh, deep eye; very heavy cropper.

—"STUDIES IN MICROSCOPICAL SCIENCE."—We are glad to see that this useful publication is continued with its former excellence. The work is published by HAMMOND & CO., of Birmingham (136, Edmund Street), and is divided into four sections, any one of which can be obtained separately. The

botanical section contains a full account of the vegetable cell by Mr. Houston, with an accompanying lithograph. A microscopical slide accompanies each part of which we have had repeated occasion to comment in terms of commendation.

— THE "BOTANICAL MAGAZINE."—The September number contains coloured figures of the following species:—

Befaria glauca, t. 6893, is a very showy evergreen shrub fitted for greenhouse culture. Its leaves are like those of a Rhododendron, but the numerous flowers are borne in loose terminal pyramidal panicles. The corolla measures about 2 inches across, is bell-shaped, and made up of seven rose-coloured petals. The genus *Befaria* grows on the Andes, the most

with green, or crimson marked with a glaucous flush with no green.

Corydalis Severacovi, t. 6896.—A handsome *Corydalis* resembling the common *C. bulbosa*, but with much larger yellow flowers with a purplish spur. It is a native of Western Turkestan, whence it was introduced by Dr. ALBERT REGEL.

Gladiolus Kotschyanus, t. 6897.—This is a very interesting blue-flowered species, introduced from North Western Afghanistan by Dr. FITCHISON, of the Afghan Boundary Commission. The foliage is narrow, linear lanceolate. The flowers are in spike-like cymes, each about 1½ inch long, trumpet-shaped, with a somewhat oblique limb.

— VEGETABLE TERATOLOGY.—A German trans-

— THE CONGO FLORA.—M. AUGUSTE LINDEN, as we learn from the *Illustration Horticole*, has sent from the Congo to the Compagnie Continentale d'Horticulture a consignment of plants, including several new Orchids, and with them the beautiful *Lissochilus giganteus*.

— A PUBLIC PARK FOR POOLE.—We learn from the *Devon and Exeter Daily Gazette* of September 4 that the Right Hon. Lord WIMBORNE has presented to the Corporation of the town of Poole 35 acres of land, to be laid out as a People's Park and Recreation Ground. Provision is to be made for a cricket ground, gymnasium, lawn-tennis court, &c. The Corporation invited designs for laying out and planting the ground in an appropriate manner,

FIG. 70.—THE OLD CEDAR AT CHELSEA. (SEE P. 336.)

southerly American Rhododendron inhabiting the mountains of Georgia and the Pine flats of Florida, just where the first *Befaria* makes its appearance. The present species was found on the Andes of New Grenada at a height of from 5500 to 7200 feet, where it forms thickets. The specimen figured flowered in the temperate-house of the Royal Gardens at Kew.

Iris Statella, t. 6894, is a yellow flowered Iris with reflexed yellow bearded sepals or falls, and erect pale primrose-coloured petals. It was received by Professor FOSTER, from the Palermo Botanic Garden, but its native country is not known.

Tulipa Ostrowskiana, t. 6895, is one of the Central Asiatic species, discovered by Dr. ALBERT REGEL. The perianth segments are acute and furnished with a cuneate blotch at the base of the segments, which are either scarlet flushed outside

lation of Dr. MASTERS' treatise on this subject has been just published by HAESSEL, of Leipsig. The translation has been made by Mr. UDO DAMMER, of Berlin, and numerous additions have been made by the translators, Professors CAMUS and FENZIG, of Modena; CASPARY, of Königsberg; MAGNUS, of Berlin; and Mr. GOSCHKE, of Proskau. The author has also contributed much additional matter, and some new woodcuts.

— RETURNS FROM "THREE ACRES."—Archdeacon LEA gives the results of an experiment in fruit farming on 3 acres of land for a period of fourteen years, with the receipts and payments during that period, from fruit, pigs, and poultry, with a balance-sheet of the best and worst years. In the worst year, 1877, the net profit was £66s. 3d., and in the best year, 1879, £799s. 11d.

and offered a prize of £20 to the competitor whose design was most approved, and £5 as a 2d prize. The prize of £20 has been awarded to Messrs. R. VEITCH & SON, of the Royal Nursery, Exeter; the 2d going to Mr. R. UPCHER, of Scole, in Norfolk. There were eighteen designs sent in from all parts of England.

— ODDS AND ENDS AT MESSRS. CARTER'S.—Some time since we had occasion to comment on a very interesting series of hybrid Wheats raised by Messrs. CARTER at their nurseries at Forest Hill, but it must not be supposed that Wheats supply the only matters of interest, trials of many sorts are carried on there, and their strains of Balsams struck us from their good habit and flowers of large size and good substance. Petunias and Gloxinias also receive attention, and were being "brushed over" to secure new

varieties. China Asters in their various races made a brave show, and it is worthy of note that Messrs. CARTER find that home-grown seed give offspring marked by greater vigour and longer duration of flower than German seed. An interesting sight is a large open shed fitted up with shelves, on which some 5000 or 6000 pots of Stocks were ripening off for seed. The plants are pricked out seven in a pot, the double flowers cut off, and the single ones left for seed. Messrs. CARTER manage to get a large percentage of doubles, but they have not yet found out any secret for increasing the proportion of doubles at will.

— **PHRYNIUM VARIEGATUM.**—This is a very beautiful stove variegated plant. It has stalked, ovate-lanceolate leaves, white, blotched irregularly with green. Each leaf is about 5–7 inches long and 1–3 inches wide. It was introduced to the Compagnie Continentale from the Botanic Garden, Singapore.

— **IRISH AGRICULTURAL STATISTICS.**—We have received an official abstract of the statistics relating to the crops of Ireland for 1885 and 1886. The total extent under crops of various kinds in 1886 is 5,033,846 acres, an increase over 1885 of 76,719 acres, or 1.5 per cent. There was a decrease in the acreage of Wheat and Oats, of Beans and Peas, but an increase in Barley and Rye, a large increase in Potatoes, Turnips, and a small one in Mangels. Cabbages, Carrots, Parsnips, Vetches, and Rape, all show a decrease. The acreage under Flax has increased by no less than 19,718 acres, while the acreage under meadow and pasture has increased by 59,370 acres.

— **LÆLIA BATEMANIANA.**—Mr. DOUGLAS states that another and much finer form of this wonderful hybrid has flowered in the Exotic Nursery at Chelsea. It certainly is a very distinct and lovely little Orchid, partaking of the character of both parents, as described at p. 263; and not only does it bear the characteristics of its parents in habit of plant, colour, and formation of the flowers, but also in their lasting character. *Sophronites grandiflora* blooms last very much longer than those of *Cattleya intermedia*; and the flowers of *L. Batemaniana* kept in good condition for a month during the recent hot weather—that is, from the first week in August to September 7. Mr. DOUGLAS measured the flowers, of which there were two on one spike, and found they were 2½ inches across, the sepals and petals a lovely salmon-rose, lip mauve-purple with a white throat; the bulbs are 3 inches long, leaves 3½ inches long by 1½ inch wide. The small plant which flowered first is a pigmy beside it. This bi-generic hybrid promises to be very free-flowering; it has flowered early in comparison to the age of seedling *Cattleyas* before they bloom; and if one may judge from the healthy appearance of the plants, they are likely to flower stronger next year.

— **A NOBILITARIAN GARDENER.**—Mr. THOS. BIRTWELL, who was for sixty years the much valued and respected head gardener of the late JAMES TAYLOR, of Moreton Hall, Whalley, died at that place on September 7, at the age of ninety years. The deceased had served also under four of his first employer's successors.

— **HAZEL-NUTS.**—The prospect from our windows, if not very picturesque, is at least suggestive. As we write, a wagon piled up with Hazel-nuts is drawn up before our doors, and the proprietors are driving a brisk trade in the toothsome nuts, which are selling at one penny the quart. Who says fruit culture is not profitable!

— **CENTIGRADE AND FAHRENHEIT.**—We take the following from the *Indian Gardener*:—"The Centigrade thermometer scale is now becoming so frequently used in English books that a short method of turning incomprehensible Centigrade into intelligible Fahrenheit will be a desideratum. The rule is simple, and the operation, after a little practice, may be performed mentally. All one has to do is to double the Centigrade number, take a tenth away from it, and add 32 to the number obtained. Let us take 60° Centigrade. Twice 60 is 120, take one-tenth away—i.e., 12—and 108 remains, which, added to 32, makes 140, which is the answer. Taking a more difficult number, 32 Centigrade, we double,

and obtain 64, from which we take 6.4, leaving 57.6, to which we add 32, the total being 89.6." Our contemporary must have strange ideas about incomprehensibility and unintelligibility. It is a scandal on our Anglo-Saxon civilization that we still continue to use the very inconvenient Fahrenheit's scale, and refuse to adopt the simpler and uniform decimal system of weights and measures. Are we really less progressive than other nations? In this matter certainly not more so.

— **ROYAL CALEDONIAN HORTICULTURAL, EDINBURGH.**—The autumn show of this Society was held in the Waverley Market on the 8th inst., when, as usual at this season's show, there was a splendid display of fruit. Entries greatly exceeded those of last year in nearly every class, but particularly in those of fruit and vegetables. There was a falling off in certain classes of plants and in exhibits from nurserymen, but the great market hall presented a richly pleasing appearance nevertheless from all points of view. A full report of the show will appear in our next issue.

— **AFRICAN OPIUM IN CHINA.**—Considering that the cultivation of Opium, though prohibited by Government, is nevertheless largely carried on in China, it seems like the proverbial "Carrying of coals to Newcastle" to read in a Consular report from Ningpo, that "A chest of African Opium from Quillimane was imported as an experiment, but the local dealers rejected it as containing sugar, and not smoking weed."

— **NEWCASTLE-ON-TYNE.**—It was not at all likely that Newcastle would be left behind, so that it is with no surprise that we learn that it is in contemplation to inaugurate in that city in 1887, an International and Colonial Exhibition, of matters relating to mining, engineering, and industry. Division 9 of the programme includes agriculture, horticulture, and arboriculture, under the chairmanship of Mr. JACOB WILSON. For the special class relating to horticulture, the following committee is appointed:—

CLASS B.—HORTICULTURE AND ARBORICULTURE.
THOMAS GRAY, Chairman.—W. FELL, Vice-Chairman.
W. R. ARMSTRONG, J. J. GILLESPIE,
A. BALFOUR, J. M'LIHTHIE,
R. W. BELL, J. WATT,
R. C. SMITH CARINGTON, W. J. WATSON,
I. CARVER, W. G. WEBB,
L. BAXTER ELLIS, ADAM WILSON,
R. G. FORTY, E. WILSON.

— **MR. GEORGE THOMSON.**—We learn that Mr. THOMSON, so favourably known in connection with the gardens at the Crystal Palace, and who latterly has been in the employ of Mr. ANTHONY WATERER, intends to devote himself in future to the profession of consulting horticulturist and landscape gardener, a position for which his attainments and experience amply qualify him.

— **ANTHRURIUM ALBUM MAXIMUM FLAVESCENS** alias **ANTHRURIUM SCHERZERIANUM VAR. LACTEUM.**—In spite of the terrible incubus of names with which this is burdened this is a very beautiful variety of *Anthurium Scherzerianum*, with pure white spathes, forming a striking background for the yellow spadix. This is a seedling raised by A. DE LA DEVANSAYE.

— **SESAMUM IN CHINA.**—*Sesamum* (*Sesamum indicum*) is grown to a very large extent in China. In the districts of Kiungchow the crop of seed is reported to have been up to the average, and the seed was largely exported by steamer. The yield throughout the island is said to have been above 120,000 piculs, more than three times as much as was produced ten years ago. *Sesamum* has been found to be a very paying crop, and it is now cultivated in all the thirteen districts of the island, but the largest supplies come from Kiung-shan, Chieng-mai, and Tingan. Two qualities of the seed are recognised in the market.

— **GARDENING APPOINTMENTS.**—Mr. G. W. MAIR, from the Royal Gardens, Edghaston, has been appointed Head Gardener to W. E. WILKINS, Esq., The Rookery, Birches Green, Edington, near Birmingham.—Mr. JAMES WEAVERS, late Gardener to THOS. BEST, Esq., Red Rice, Andover, Hants, has been appointed Gardener to W. L. CHRISTIE, Esq., Glynedbourne, Lewes, Sussex.—Mr. JOHN WALLACE, Foreman to Mr. THOMSON, Gardener to His Grace the Duke of GRAFTON, K.G., Wakefield, Northamptonshire, has been appointed Gardener to Mrs. SHAKESPEAR, Langley Priory, Diesworth, Derbyshire.

Notices of Books.

How to Grow Peaches, Nectarines, and Pears, on Open Walls. (Robert Smith, Valling, Kent.)

THIS modest pamphlet, by an experienced grower of these fruits, is well worthy of the attention of young gardeners. In the thirty-one pages of the treatise the writer insists on the possibility of as good fruit crops being obtained from open walls now as for fifty years past, but the trees must have proper attention, and some amount of protection.

Living in the fruit county *par excellence*, he is apt to underrate the importance of blinds and other contrivances to ward off frost, and is content with a simple portable coping of board 11 inches wide, a mode of protection good enough there in the generality of seasons, but not affording enough in other parts of the country. Great stress is laid on this training of the shoots, root-pruning, shallow planting, mulching, and feeding, the latter two especially where show fruits are desired. He is something of an extensionist, but fails to tell the reader how he gets the middle parts of the trees furnished with bearing wood, so we must imagine he follows a modified mode of extension only.

The chapter on Pears might with advantage have been made more instructive, for Pears are not like stone fruits in their habit of growth and formation of fruit-spurs, but exhibit much variety in these respects, matters which receive no notice whatever. Trustworthy lists of fruits are given under each heading, and simple methods of annihilating insect enemies are supplied.

TREES AND SHRUBS.

THE TAMARISK.

ONE can understand why this handsome sub-evergreen shrub is so frequently planted on the sea coasts, on account of its adaptability for such situations, and its power of resisting the sea breezes. In this particular instance, and for such purposes the majority of shrubs are but ill adapted, and, indeed, signify fail. It is true that *Euonymus*, *Ivy*, *Lycium barbarum*, and some species of *Pinus* and others stand the sea breeze well, but they are heavy and inelegant compared with the slender, graceful, and excessively ramified stems and branches of *Tamarix gallica*. The latter attains its greatest dimensions in damp or moist situations, such as the banks of rivers; and instances are recorded of its attaining a height of 20 to 30 feet both in this country and on the Continent. It may be put to purposes of the greatest ornament, however, where great size is not a desideratum, such as at Eastbourne, Brighton, and Hastings, especially the first-mentioned place, where thousands of plants clothe the steep chalk banks along the side of the esplanade, with waving plummy masses of the most delicate verdure. These shrubs are planted in lines (an example, however, which need not be followed) and annually, or at least frequently cut back like so many Willow stools, and the result after growth has proceeded for some time, is to say the least of it encouraging. What would otherwise be dry chalk banks, glaring in their whiteness, where scarcely anything else of an ornamental character except Wallflowers, and Stocks could maintain a footing, is converted into an attractive shrubbery despite the absence of much variety. *Euonymus*, Wallflowers, *Sedums*, and several other rock plants, it might be mentioned, are associated with the Tamarisk in places. This shrub also stands the knife and shears well, making excellent hedges. Something of this sort might more frequently be attempted inland where the shrub succeeds perfectly. It is easily propagated by cuttings in an open border with a northern exposure, whence a good supply could be procured in a comparatively short time. The stiff and formal character of a bank of the common Laurel could easily be dispensed with in many instances, and its place occupied by a bank of Tamarisk, greatly to the satisfaction of all concerned. Sweet Briar hedges have been greatly lauded and recommended lately, with much reason undoubtedly; but hedges of this elegant evergreen might also vary the character of garden scenery with great propriety. The extreme minuteness of the

leaves prevents disfigurement in clipping, a quality which can hardly be claimed even by the B.K. If desirable and appropriate for the surroundings, a loose untrimmed hedge could be restrained in its bounds by a judicious use of the pruning knife alone, and such a hedge would be enlivened by myriads of small pink flowers in their season, which if devoid of the fragrance of a Sweet Briar hedge, would not be wanting in attractiveness. *J. F.*

CARPENTERIA CALIFORNICA.

We learn that this beautiful shrub flowered in spring out-of-doors in the garden of Mr. B. H. Brooksbank, of Sandrock, Tickhill, Yorkshire.

ARALIA MAXIMOWICZII

is a hardy shrub of distinct appearance, with its dull purplish spiny stems and bold palmately lobed foliage, hairy on the under surface. Its effectiveness may be well seen when grown in contrast with other shrubs, as at Combe Wood.

EDWARDSIAS.

The Edwardsias are trees of straggling growth, but the Fern-like leafage is so pretty that their presence is a gain to any border, clump, or shrubbery. A branch looks extremely pretty when projected through or above other foliage. *E. microphylla* is perhaps the hardiest.

CLERODENDRON TRICHOPTOMUM

is a bold tall-growing shrub, with large cordate ovate leaves, and large upright many-flowered panicles of white flowers, whose delicious fragrance is in singular contrast to the foul odour of the leaves when bruised. Moral: don't bruise the leaves. It is in full beauty at Combe Wood.

HOME CORRESPONDENCE.

The Hardy Jasmine (*Jasminum officinale*).—Notwithstanding the fact that the old white Jasmine is a deciduous plant, it has many merits which make it suitable for the walls of houses, &c. The fact of its being deciduous should not be made to tell too much against it, for many subjects, such as Clematis, Roses, &c., are so, and the Jasmine has the merit of having very handsome foliage, quickly formed, and as readily laid aside, which is worth something on the score of neatness and economy of labour. The common Jasmine is often thought to be of slow growth and bloom. Facts contradict both these ideas. Planted in fairly good soil, kept properly trained as it grows, it produces very long strong shoots, and if planted, as I suggest it always should be, on a sunny wall, it will bloom freely very early. So much for quick covering and bloom capacity; but this is not all. When once these shoots have been well trained into place they will last there, continuing to bloom each summer *en masse*; the only thing necessary is to clip the young shoots closely back each autumn. Can the same be said for any other climbing plant? I think not. It is but necessary to add to these merits the beauty and fragrance of the flowers, and I think the claims of this good old subject prove unanswerable. How glad I should be to learn where I could obtain the double-flowered variety. *William Eary.*

Wild White Poppies.—The white variety of Papaver Rhoeas, see p. 306, is not a novelty; I have long been acquainted with it, although it is undoubtedly rare. Mr. Britten records it, as well as the white *P. Argemone*, in *Journal of Botany*, 1865, p. 336. The faintly rose-coloured varieties of both species occur here with the white. I sent you a note two years ago, of a yellow Poppy that I could not distinguish from *P. Rhoeas*. *W. G. S.*

Pea, Telephone.—I see in your issue of August 21 a few remarks from "W. H. D." upon Pea, Telephone. Your correspondent says that with him the large podded varieties have not done so well as the smaller podded ones. With my little experience I am unable to see why the large podded varieties should suffer from mildew and the small podded varieties not. Perhaps "W. H. D." will kindly give me, and other readers of your paper, his opinion as to the cause of the large varieties, such as Telephone, becoming mildewed, and the small podded ones not being so affected. With me this year, up to the present date (August 24), I have not detected the least sign of mildew in my garden, and I have Peas in all their different stages. I can only wish "W. H. D." had been so fortunate as I have this season as regards mildew. I would just say that I have grown about twenty varieties this year, and from this and past experience, that I cannot give preference to small podded varieties for any purpose when we

have such Peas as Telephone, Stragem, Pride of the Market, Telegraph, Duke of Albany, Evolution, Walton Hero, Mr. Laxton's No. 6, the name of which I have forgotten, but it is about the same in quality, colour, and shape as Duke of Albany, and is a very large cropper. The Peas I have named are all good croppers, good for exhibition, and good for culinary purposes, and with about two exceptions are very sweet-flavoured. The four largest and best podded Peas, taking all points into consideration, I should say are Telephone, Duke of Albany, Stragem, and Mr. Laxton's No. 6, and of these I should certainly say Telephone is the best. *Henry Marriott.*

A Fine Lilium Auratum.—I have a specimen of *Lilium auratum*, var. *atro-nubens*, with two spikes, one having seven, and the other forty-seven flowers. It has been established for six years, gained two 1st prizes, and, what rarely occurs with this Lily, is increasing in number and floriferousness. The method of cultivation explains all. It is out-of-doors. *A. D. Webster.*

Fig Trees from Seed.—I have read the correspondence on the above subject with considerable interest, because, when a boy, I worked for several years in a garden in Kent, where Figs grew in abundance, and where the most standard trees at generally bear some very fine fruit; but I never saw a seedling Fig tree, and I was so much interested in everything connected with horticulture that they were not at all likely to escape my notice. The variety grown was Branswick, and often some would get thrown to the ground that were partially destroyed by wasps and birds. There is one point connected with the Fig which has escaped notice in the late correspondence, and which may possibly account for the appearance of some of the young plants. The Fig tree, when it is not restricted by artificial means, sends out its roots to a great distance; if a small piece of one of these roots gets detached, and placed in a favourable position, it will throw up a shoot very much resembling a seedling plant, or rather, what I should suppose a seedling would be like, for, as I have already said, I have not yet seen one. There is another peculiarity about the roots of the Fig, viz., they retain their vitality for a very long time, as the following instance will show. Some small hours after a Burghley once contained a Fig tree which was eventually destroyed, and a Peach tree planted in its stead. Six years afterwards it was found necessary to remove some of the soil to a considerable depth, and a detached piece of the root of the Fig tree was found which had retained its vitality uninjured; this portion was about 1 inch in diameter and 2 inches in length. No shoots had ever been noticed from this buried piece of root, but it was too far from the surface. *W. H. Dacey, Ketton Hall.*

— I have here a seedling raised from Brown Turkey raised in March, 1884, and I am hoping to fruit it next year. If I am fortunate enough in doing so I shall send up a fruit. I was led to understand, when I was apprentice in Scotland, that the Fig sent out under the name of Castle-Kennedy was a seedling raised by Mr. Fowler. Perhaps some correspondent will enlighten us on the subject. *Thompson.* [The variety called the "Red-hot poker" was not raised there.]

— I send herewith half a dozen seedling Figs, hundreds of which come up annually in open ground here. Where they come from is a mystery, as no Figs have been grown here for several years. *E. Crump, Kameleh Gardens, Leamington.* [With this came a small boxful of seedling Figs. Ed.]

Kniphofia aloides as a Bee-trap.—Many of the readers of the *Gardeners' Chronicle* have no doubt noticed that the bees are particularly fond of *Kniphofia aloides*, and swarm about the "red-hot poker" like so many moths around the lamp. It may, however, be somewhat new to them that (as the following account of my observations will show) is rather a dangerous sport to the bees, often resulting in the pitiable state of the dying individuals that come too near, just as the moth's perilous dance round the lamp, is apt to be a short but tragic tale. The bee, having selected a young and fresh looking flower, alights on the long style. Now, if it contents itself with gathering the pollen of the anthers outside the flower it is all right—nay, it may even go so far as to creep more than half-way into the narrow tubular flower, but if, tempted by the excellent quality of the nectar, it creeps right into the flower, its position becomes highly critical. The narrowness of the tube hinders the free movements of its limbs, the smooth inner surface furnishes no firm hold for its feet; moreover, the viscous honey that soaks it and its own hairy skin render its desperate efforts unavailing. Some of the stronger individuals succeed in pulling themselves out, but their weaker brethren soon become exhausted. By-and-by the flower withers and contracts itself at both ends, thus wrapping up the remains of the unfortunate insect in a translucent, tight shroud. A good many bees are thus put to death. I have gathered dozens of such "bee-

mummies" from a single spike. Although of no practical consequence, on account of the scarcity of the *Kniphofia*, it is interesting as the only instance (as far as I know, at least) of a real danger in connection with the useful task of the "busy bee." *J. E. Lange, Royal Gardens, Kew.*

Tobacco Culture in Shropshire.—Considerable interest is being manifested in the remarkable success which has attended the attempt to cultivate the Tobacco plant in the beautiful (Barry at Shrewsbury. About forty of the plants were placed in the soil in May last, and they are now in a well-developed and thriving condition, the hot weather of the past few days having accelerated their growth in a striking degree. They are dotted about amongst groups of Rhododendrons, and no special preparation was made by way of enriching, or in any way altering, the nature of the soil, neither has any special care been bestowed upon them. They were very simply treated as ordinary plants, and therefore the result of the experiment is regarded as being peculiarly satisfactory. The plants stand 4 feet high; the larger leaves are 2 feet long, and 15 inches wide; and the stems measure nearly 4 inches in circumference. The blossom—a bright yellow bell-shaped flower—is now fast fading, and the seed-pods are being rapidly formed and well filled. The leaves, which average from ten to twelve on a stem, are ripening very quickly, and should weather continue, they will in a short time be perfectly brown. The plants are being grown merely for ornamental purposes, and as such are not liable to duty. *H.*

Carters' Tobacco Experiments.—I took advantage, with some friends, a short time since, of a spare day in your metropolis, and the courtesy of this enterprising Holborn firm, to see their experiments in the Wheat hybridisation and Tobacco culture. Looking over the *Gardeners' Chronicle* before my return here, I find you allude to the above, p. 274, and, I am sure, with your customary courtesy, you will allow me to differ from your representative, who preceded us the previous day there, in a few particulars. The ground would seem to be over, rather than under an English acre, and instead of being well suited to the growth of the Tobacco plant, I am satisfied Messrs. Carter or their excellent manager, Mr. Sharman, will be unable this year, to draw any accurate conclusion as to which of the varieties is the most suitable for growth in Great Britain or Ireland. The lower portion of the field has soil about 4 inches deep, resting on a bed of sand, and even these few inches of soil seem cold and retentive of moisture—exactly the opposite of what the Tobacco requires. The higher lying portion, except where some charred ashes were scattered—on which the crop conspicuously shows—I would consider also as of second quality. I would suggest that the results be carefully noted in connection with the soil formation, but that no conclusion be drawn as to which is the most suitable variety, until after a further trial next year in a deeper, richer, and warmer soil. The price, we understood the firm had to pay for the temporary use of the field seems most exorbitant, and should give them their choice of any field in any country district of Kent. I am growing a small quantity for experiment myself, and have already come to the conclusion the depth and quality of soil, with a greater or less quantity of manure either in the garden or on the farm, wholly alter results. Again as I noted in the visitors' book at Messrs. Carters' trial grounds, I consider six, rather than nine large leaves as much as can be well matured in that climate, where we were assured first has appeared in mid-September, and this opinion was shared by several other gentlemen then present. I am very much interested in those experiments in Ireland, especially in this locality, where the soil, living, remember fields of Tobacco being grown, before its culture was prohibited. *H. J. Mearns, Clonmel.* [We think the land under Tobacco at Plainstow was under an English acre; as a matter of fact we were told by the person in charge of the crop that it was three-quarters of an acre; and it was stated in our note that the land chosen was so far suited to the culture in being sheltered. The bottom of the field is liable to flooding from a ditch close by, but the soil at that part is not retentive, but is a black sandy loam, that gets too much moisture at times. There is not much to be gained for the scheme of Tobacco culture in these islands, when so much stress is laid on the quality of the soil, for, as a matter of fact, if it is of average quality, and neither heavy nor very light, it will grow good Tobacco, provided the proper sort of manure be given, and in sufficient quantity. If Tobacco is to be grown by farmers it must accommodate itself to great varieties of soils, or it will be useless as a field crop. If only the most suitable soils were chosen for Wheat it would be a prohibited plant in some English counties, but yet we find Wheat grown everywhere with varying success. It is well that the experiments of Messrs. Carter & Co. are carried out on poorish land, and not on that which is first-class, for if the plant will grow well at Plainstow

it will certainly do still better on richer soils. We think it will be advisable to await the results of Messrs. Carters' public-spirited enterprise before venturing to give a decided opinion on the matter one way or the other. Ed.]

A Floriferous Stephanotis.—In looking through the extensive and beautiful gardens at Eastnor Castle, near Ledbury, a few days ago, I noticed in one of the many houses a plant of *Stephanotis floribunda* growing in a bed at the end of a lean-to house, about 25 feet long, and trained to a trellis fixed underneath the roof. It was in a most flourishing condition, the leaves being large, and of a rich dark green colour, and from the axils of which proceeded large trusses of its ever-welcome flowers, and of which Mr. Coleman, who is as much at home among plants and Coniferæ as he is among hot-house fruits, informed me there had been 1800 cut within the past few months. The roots of this fine plant are, I believe, growing in a mixture of peat and loam, rather more of the former than the latter. A remarkably fine and healthy batch of plants of *Eucharis amazonica*, growing in pots on the bed underneath the *Stephanotis*, is also worthy of notice. The shade afforded them by the latter evidently suits the *Eucharis* plants, as there was not a scorched leaf to be seen in the house. The condition of the plants gave promise of a rich harvest of this chaste and much esteemed choice flower, the supply of which is not likely to exceed the demand in any gardening establishment. Curiously enough the same garden I was at Eastnor, I saw at Devonham Bank, Malverno, a house the fac-simile of the one of which I write, and in which the *Stephanotis* (also trained under the roof) and *Eucharis* plants gave proof, like the contents of the several Orchid-houses, fruit-houses, &c., that the treatment accorded them by Mr. Jaques was congenial with their requirements. The same may be said of a fine batch of *Eucharis* plants at Madresheld, Court, also growing in pots, and within two miles of Malverno Link. It would be interesting to hear from Messrs. Coleman, Gump, and Jaques the kind of compost in which they grow their *Eucharis amazonicas* so successfully, and the general conditions under which their respective collections do so well. *H. V. V.* [We hope the gentlemen in question will respond to the invitation. Ed.]

Surplus Gardeners, and What to Do with Them.—Concerning this subject, which has been treated of at pp. 277 and 306, I might, if permissible, make some observations, relate experiences, and offer suggestions. What to do with our gardeners is merely another form of stating the question what to do with our boys, and with a somewhat more limited application, and both questions are constantly recurring in all over-populated countries. In spite of the low wages and the length of time necessarily spent in gaining experience and waiting for a situation as head gardener, or anything remunerative, there are various reasons to account for the surplus of labour with which the profession is burdened. Its ranks are crowded by many who believe it to be an easy occupation, and parents in the same belief, with the additional attraction of a respectable calling, send their sons, because unable to send them anywhere else, to school, and then upon gardening who have failed in other pursuits, through faults or inabilities for which they were responsible or, it may be, irresponsible, and hence it often happens that these men are well educated, whether they are adapted for gardeners or not. Fruit and flowers are great attractions, and easily captivate the mind in early years, and many could doubtless trace their first ideas of a liking for gardening to the recollection of a trip to some well-kept garden which they were permitted to visit by way of school, or in some country place or village. That such visits and recollections foster a love of gardening there can be little doubt, and such are legitimate sources of supply of young gardeners. It would be a difficult and not very laudable task to attempt to limit the supply, and one which might often rob the profession of its most able and deserving members. Many gardens are almost worked by apprentices, firstly, because their labour is cheap, and secondly, because it is more under the control of the gardener; but what is more reprehensible at some places, is the fact that apprentices are allowed to go as journeymen after two years' service. If there are fewer unemployed in this than other professions generally, it may be accounted for by their quiet and steady demeanour, for if not contented with their modest lot, they rarely break out into strikes and other disturbances. The unemployed are often those who succeed in obtaining situations for summer only in places where fewer hands are required in winter. As a counteraction to the surplus of labour, many do join the police force, enlist as soldiers, go abroad to fill situations by appointment, or go on chance to rough it as best they may. Some take to market gardening, or become florists, which may be considered a fairly legitimate outcome of their acquirements and well-earned experience. Not a few

condescend to accept what is termed a double-handed job, that is, in addition to gardening, they undertake to mind the pony, or even do the hall boy's work. That such is not very creditable in some instances I admit, but refuse to accept the statement tendered by some, that it lowers or debases the status of the profession. The latter need never fear losing its best ornaments, for it rarely happens that a man of intelligence, great acquirements, experience, and good breeding, will condescend to accept such a situation. On the other hand, many a gardener could turn his talent to practical account in teaching, for which his early training in many instances would eminently fit him. Every large school should and could easily maintain its garden and lecturer, or gardener whose duties should be to give instruction in botany and practical horticulture as circumstances might require. A practical gardener would certainly be the safest investment for such a school, where instruction might be disseminated to rich and poor alike. In these days of cram it would be impossible for the regular teacher of a school, whose duties are onerous enough already, to undertake such additional labour; besides which he would be greatly deficient in those qualities acquired by practice only during years of untiring energy and patient perseverance. The boys belonging to certain standards could be deputed to attend their instruction in practical horticulture at certain hours of the day or days of the week, so that everything might proceed with regularity, and be as practical as possible. Evening classes might also be instituted where the older pupils and even young gardeners and others could be taught botany, mor-

ject to mildew here, as our garden is situated at the bottom of a narrow valley close to a river and a large pond, and we are, generally speaking 4° or 5° cooler at night than our neighbours, from what I have seen of the country near Mr. Marriott, it is very different to this, and I can quite understand that he has grown the above Peas without being troubled with mildew. He has probably a deeper and richer soil than ours, a more even temperature, and does not feel the effects of dry weather so quickly. We are gaining much in size of pods with these newer varieties, but of what advantage is that? The pods are only thrown away when they get to the kitchen, and consequently a lot of the plant's energy is wasted. A much greater quantity of Peas is obtained from such varieties as G. F. Wilson, Goldfinder, Standard, Marvel, President Garfield, &c., and I could not supply a large family from a very small kitchen garden as I do at present if I depended on the large podded varieties. I admit the smaller pods stand a poor chance at an exhibition with the majority of judges. But why should size alone be considered? In these days of strict economy and keen competition, we want the largest quantity of first-class produce from the smallest space. *W. H. Divers, Kettan Hall.*

Various Plants at Chiswick: Hollyhocks.—In, as it has been well called, the revival of the Hollyhocks the Royal Horticultural Society at Chiswick has played no mean part. In an effectively planted mixed border there, some 90 to 100 feet in length, may be seen a noble line of these stately plants—veritable floral sentinels. Used as a back-

FIG. 71.—XANTHOCHYMUS FRUIT: COLOUR ORANGE: EDIBLE (SEE P. 336.)

phology, physiology, or horticulture according to the desire of the community. In the case of smaller schools two or more might combine and support a garden and instructor for their common good. The most enterprising nations are paying great attention to the education of their subjects, and Britain of all nations should be abreast of the day [but is not. Ed.] *J. F.*

Lythrum Salicaria.—What a very handsome and stately plant is this purple Loosestrife! I lately noticed a fine specimen, about 4 feet high, in Mr. R. Dean's seed grounds at Bedford, its long perennial leafy spikes of densely whorled flowers making it a conspicuous and attractive object, the damp situation in which it was growing seeming to "bring out" its many good qualities. *B.*

Peas mildewed (p. 307).—In answer to Mr. Marriott, I consider the large podded varieties failed in this respect from constitutional weakness, as other varieties with smaller pods, sown the same day, side by side, and treated exactly the same, escaped the disease. It is well known that certain atmospheric changes which cause a sudden check to the growth of Peas and other plants, cause also an outbreak of the above disease, and when the smaller and more robust growing varieties escape, and these large podded varieties are attacked, it is a plain proof that the latter are not so well able to withstand the attack. I have noticed the same thing in former seasons with Telephone, Evolution, and Culverwell's Giant, so much so, that I am inclined to think they are all near relations of Prodigy, or rather that all would trace back to one parent. Unfortunately, we are very much sub-

ground what a fine effect these flowers produce. We append names of a few of the most striking sorts:—Warrior, a fine flower, bright crimson colour; Monarch, same colour, a good variety; Diana, bright red. Good yellows are Surprise, Mandarin, and Funia; Norma, pure white; Isabella, pale blush; Mrs. Anstie, bright red; Horace, fine crimson; Mrs. Barnes, delicate pink; Constance, good salmon. Asters.—From that land of fine Asters, Germany, Herr Ernst Benary, has contributed some good flowers this season that at the present time help to impart quite a lively aspect to the old garden. Rose Dark Scarlet, a rich dark crimson flower—one of the finest—very noticeable with the sun full upon it how grand it looks! Mignon, pure white, good; Dwarf Peony Perfection, a dwarf class of great beauty of various hues of colour, the light blues very effective. Another charming class, too, is the Lilliput flowered, producing small flowers in great abundance. Truffaut's Peony flowered, producing flowers from snow-white to purple-violet; large flowered Rose, splendid. *B.*

The Last of Spiranthus Romanzoviana.—The following letter, received this morning from Mr. Gumbleton, of Belgrave, Queenstown, Co. Cork, speaks for itself:—"I think it may interest you to hear, and perhaps add to the value of the plants I sent you last year, that in all probability *Spiranthus Romanzoviana* will very soon become extinct, and no longer be obtainable in the one locality in Europe—in the neighbourhood of Castletown, Burhaven—to which it has hitherto been indigenous, for on writing recently to my agent, Mr. Barrett, who sent you the plants, to ask him to obtain a flowering

specimen of this rare little terrestrial Orchid for Mr. Burbidge to draw, he sent me, a few days afterwards, a letter from his friend, Dr. Armstrong, who had collected the plants sent to you, stating that on going to the little boggy field where he had hitherto seen it he found the little plot ploughed and planted with Potatoes; and on going to the only other locality where he had ever found it—a narrow headland

character which is so characteristic of the British nation above all others in matters horticultural, or, rather, concerned with the preservation of our native flora. An Edelweiss or a Gentian can receive attention at the hands of a foreign Government, but that this sweet little plant, that is a thousand times more rare, and with only one station in Europe, has been suffered by a nation professing themselves high in

garden at Wallington there are none more picturesque and pleasing than the noble clump of Burdocks by the side of the pretty lake. This grand weed is one of the chief favourites of the landscape artist, as it makes a splendid subject for the foreground and margin of streams. The bold and handsome foliage has, under ordinary aspects, a glorious hue, which affords a pleasing contrast to the more lively greens of the meadow-grass and summer leafage. The Burdocks referred to form an effective foreground to a very pretty landscape, especially cool and inviting, no doubt, on a summer evening. A broad green walk of smooth turf, the bold margin of Burdocks, the clear water of the lake broken here and there by rafts of Water Lilies, green slopes on the opposite side with grand masses of scarlet Thoro reflected in the water, and in the distance clumps of Scotch Fir and other trees complete the picture. Mr. Smee is exceptionally favoured by having an arm of the Wandle to flow through his garden, and must be congratulated on the good taste apparent in the disposal of it. The little combs and dingles, musical with the voice of tiny streams dancing and sparkling along them, are just the home for the more stately species of British Ferns: Filix-femina, O-munda regalis, Lastrea dilatata, Polystichum, and Scolopendrium, flourish amazingly in the moist, warm, hazy atmosphere. Mr. Smee holds to the good old custom of mixed borders, and there is no hard-and-fast line between the flower and kitchen gardens; there is something to admire at every turn, and there are many turns in this fine garden. The Orchids, of which there were numerous beautiful specimens in a cool, shady house, were arranged in admirable taste; notwithstanding these, however, and many other pretty and interesting subjects, in my hasty visit the features that impressed me most were the grand masses of Burdocks by the lake, and the splendid groups of Ferns in the shady combs. *T. W. Harrow.* [The Burdock here named is, if our memory serves us, the Butterbur, *Petasites vulgaris.* ED.]

The Hartstongue (*Cynoglossum officinale*).—Although this plant has a disagreeable smell, yet its good habit and abundance of purplish-red flowers should alone make it a favourite. On some of our stony wastes along the sea coast it is now blooming freely, and from its appearance attracts a good deal of attention. *A. D. W.*

Reports of Societies.

ROYAL HORTICULTURAL: DAHLIA and FRUIT SHOW, September 7 and 8.

ON this occasion one of the best of the present season's shows of the Society was got together, thanks to the efforts of the Society and of the donors of special prizes. The Dahlias were less numerous represented in the show and fancy classes, while single, Cactus, bouquet, and pompon varieties were in greater abundance than on some former occasions.

The trade exhibits were not fewer in the single flowered class, but it would appear that as a decorative plant its day is on the wane, for the Cactus and the chaster bouquet varieties are 'usurping the place once held by the single-flowered Dahlia amongst those who set the fashions in flowers.

We were glad to see a well known firm—Messrs. C. Lee & Son—put in an appearance, with a remarkable collection of leafy shoots and perfect plants of trees and shrubs possessing variegated or coloured foliage.

Mr. Ware's collection of flowers in season, was likewise greatly admired for its extent and variety; and Messrs. Kelway's Gladioli were remarkably fine.

FLORAL COMMITTEE.

Present: G. F. Wilson, in the chair; and Messrs. H. Bennett, W. Bealby, T. Baijes, H. Herbst, J. Hudson, R. Dean, A. F. Lendy, J. O'Brien, J. Domyio, C. Noble, H. Turner, G. Paul, C. Duffield, E. Hill, J. Douglas, W. B. Killock, H. Cannell, J. Walker, and M. T. Masters.

Messrs. Paul & Son, The Old Nurseries, Cheshunt, showed amongst a collection of hardy subjects, branches of *Ulmus myrtifolia purpurea*, a handsome and distinct variety; *Hydrangea paniculata*, with immense spikes; and *H. nivea*, an equally large tree, with white flowers. This latter is not of the Chinese hortensis section, but is of North American origin, and is as yet rare in gardens. The chief other exhibits comprised a number of varieties of *Helianthus*, mostly single flowered; *Phialodolpus coronarius variegatus*, a very boldly marked leaf of white and green; *Ulmus plumosa aurea*, a yellow-flowered *Rhus*, *Shepherdia argentea*, a grey-green leaf, the under side silvery; many boxes of cut blooms of Roses and Dahlias, some Lilies, and a variety of flowers of herbaceous plants.

Messrs. H. Cannell & Sons, Swanley, exhibited several boxes of single Dahlia, pompons, bouquet, Cactus, show and fancy sorts; *Cactus Dahlias* Lady E. Dyke, a

FIG. 72.—XANTHOCHYMUS PICTORIUS, BOTANIC GARDEN, CHELSEA. (SEE P. 336.)

skirting a small wood—he found it turned up and bearing a crop of Oats." Alas! it is to be regretted that a plant so lovely and so full of interest to every British botanist should now, under such trivial circumstances, become a thing of the past. Why steps were not long ago taken by the Government authorities at Kew to secure the piece of ground for the purpose indicated. Surely they have enough to do without that, even if the Treasury would permit such a scheme. ED.]

botanic matters to pass into oblivion, is a matter not only of shame but of lasting regret. *A. D. Webster, Lanégar, Bangor.* [We share our correspondent's regret, but we confess to no feeling of bewilderment that the authorities at Kew have not secured the piece of ground for the purpose indicated. Surely they have enough to do without that, even if the Treasury would permit such a scheme. ED.]

Burdocks and Ferns.—Among the many varied and interesting objects of Mr. Smee's delightful

bright yellow; Charming Bride, mauve and white, very pretty; and Black Knight, a very dark maroon, were selected as being the most deserving of recognition. Blooms of single and double-flowered Begonias were also shown by Messrs. Cannell.

Mr. H. Ballantine, gr. to Baron Schroeder, exhibited a lot of *Vanda Dearei* a poor looking species, with which-yellow flowers (two), the lip is yellow.

G. P. Wilson, Esq., exhibited a well-bloomed plant of *Lilium auratum* platyptalum.

Mr. R. Denn, florist, Ealing, showed out spikes of handsome kinds of Penstemons.

Messrs. J. Hatch & Sons, Royal Exotic Nursery, Chelsea, showed a new Fern, *Davallia retusa*, a species from Sumatra, with fronds long and arching, frondlets set widely apart, as also the wedge-shaped pinnae—the colour of the plant is a light ochraceous shade of green, the midrib being of a light pistachio green; the habit light and open. *Phrynium pumilum*, a *Diefenbachia* like stove herb from Dutch Malaya, with long-stalked lanceolate leaves, foliage variously marked with white running longitudinally; *Selaginella gracilis* from the South Sea Islands, with dark green fronds, unbragous in habit, a species packed with minute green leaves, and the height of the plant observed about 1 foot. Some plants of *Nephrolepis rufescens tripartita* were also shown in this collection.

Amongst smaller miscellaneous subjects may be mentioned the cut blooms of *Crysanthemum*, L. Werning, from Mr. Mortimer, Chrysanthemum, Farnham; Cactus, show and seedling Dahlias, from Mr. Humphries, Kingston Langley; a scarlet flake Carnation from Messrs. Luing, Kelsö; a very fine white Mignonette from Mr. Bamster, Cote; a fine *Phytolacca* from Mr. Latham arising from Mr. Maillard, 3, Arneson Road, Bayswater; Ten Roses came from Mr. Prince, Oxford; Messrs. Keynes, Williams & Co., Salisbury, showed Cactus Dahlia Colonist, a yellow suffused centre, named with scarlet; Mr. Gordon, plant and florist, 1, Twickenham, had a number of plants of *Lilium aureum* var. virginiana, a white form with faint yellow bands on the inner middle part of each petal; the New Plant and Bulb Co., Colchester, showed a collection of Lilies, chiefly aureum and lanceolatum rubrum; Mr. John Wall, Thame, showed several two varieties of quilled Asters, choice in form and colour.

From Messrs. Heath, Cheltenham, a single-spiked plant of *Dendrobium ciliatum*, and a plant of *Odontoglossum viridatum*.

Messrs. J. Sander & Co., St. Albans, came a large basket filled with young plants of *Galeandra Bauri*, several flowers on each being open, making as a whole a pleasant sight.

Messrs. Charles Lee & Son, Hammersmith, had placed a conspicuous group of coloured foliage plants and shrubs, at the entrance of the conservatory. We noticed among them *Acer Retenbachii*, a variety with very dark leaves; *A. colchicum rubrum*, with reddish-bronze leaves; *A. Schneidleri*, not so good as usual, owing probably to drought; *Tigonia strigatocarpa* variety robusta, yellow-rose only; *Quercus serrata*, form of *Althea frutescens*; gold and silver variegated *Eunonymus japonicus*; *Castanea vesca*, with normal-sized foliage, which is margined with white—a fine subject; *Cerasus mahaleb variegata*; *Juglans sinensis*, an edible nut-bearing species, with finely lacinated foliage, growing when in tune to the music of the conservatory; *Thuja*, entire leaved, acutely toothed on the edge of the leaf; *Q. laurifolia*, a handsome species, with leaves entire, about 9 inches in length; *Q. robur elegantissima*, with white variegation on the leaf; a variety of *Cornus mas*, with better form and more pleasingly than any other on that species; *Pyrus sorbifolia vestita*, a bold leaf with a grey tomentum on the under side; *Sambucus laciniata variegata*, very pretty white and green leaves, especially the young terminal ones; *Salisburia adiantifolia* aurea, with leaves striped irregularly with yellow; and, lastly, *Acacia angustifolia elegans*, the handsomest of all the hardy Acacias.

Mr. T. S. Ware, Hale Farm, Tottenham, showed large numbers of cut blooms of Dahlias of all the sections, Lilies, Terns, Nerines, *Tigridi conchiflora*, variety of shades of yellow, and several dwarf shrubby Veronics, as *carolinata*, *Chathamia*, *pinguifolia*, and *busifolia*; *Phloxes*, *Poppies*, and many others, the whole being a dazzling display at the back of the conservatory.

Mr. W. Paul & Son, Waltham Cross, showed many boxes of cut blooms of Roses, and a basket of flowers and fruit of *Rosa rugosa*, and *Rosa pomifera* in flower and fruit.

Messrs. Vilmorin, Andrieux et Cie, Paris, showed a number of cut blooms of Asters.

Messrs. Kewley contributed a large collection of cut Gladioli spikes, such as *Gladiolus*, *Gladiolus*, &c. In an extra special class, a first prize was best-awarded to Mrs. Sotheran, Lyndhurst, New Brighton, for four cases of flowers, dried of their natural colours. The flowers were arranged bouquet-wise, as medallions in a frame, and at a distance re-enabled a coloured drawing of flowers and foliage rather than dried specimens.

FIRST-CLASS CERTIFICATES.

To Byron Schroeder, for *Vanda Dearei*.
To Messrs. Cheal & Sons, for single Dahlia Mrs. Kennett.
To Messrs. Cannell & Sons, for Charming Bride.
To Messrs. Cheal & Sons, for Lady E. Duke.
To Messrs. Cannell & Sons, for Black Knight.
To Messrs. J. Veitch & Sons, for *Phrynium pumilum* and *Davallia retusa*.
To Messrs. Keynes, Williams & Co., for Dahlia Colonist.
To Messrs. Rawlings Brothers, for Dahlia Mrs. Theobald.

Fruit Committee.

Present: J. E. Luce, Esq., in the chair; and Messrs. J. Barnett, T. J. Saltmarsh, G. T. Miles, J. Roberts, W. Warren, W. Paul, G. Goldsmith, G. Norman, J. Willard, P. Crowley, R. D. Blackmore, and G. Bunyard.

SHOW OF HARDY FRUITS.

For the best collections of Grapes, Alicante, two bunches—1st, Mr. Taylor, gr. to J. Chaffin, Esq.; 2nd, one of the bunches shown was a very fine one—equal to 5 lb., the other being smaller; in colour, bloom, and size of berries generally nothing could be much better; and a few unfertilised berries were, however, observed in them. 2d, Mr. Hollingworth, gr. to J. F. Campbell, Esq.; 3rd, Mr. Hurrey, gr. to J. F. Campbell, Esq.; 4th, Mr. Hoare, gr. to H. Taylor, Esq.; Park Hill, Streatham Common, colour and bloom good, but with unevenness in the berries. Five lots were shown.

Two bunches of Alwick Seedling—1st, Mr. Taylor, compact bunches, fullest in colour and bloom; 2d, Mr. Drinkwater, gr. to C. Bell, Esq.; 3rd, Mr. Taylor, Choclad, the bunches having the usual divided appearance, as if of two shoulders, bloom capital, berries large and even; 3d, Mr. Goodacre, gr. to the Earl of Harrington, Elixton Castle, with small bunches. Eight lots were shown.

Two bunches of Black Hamburg—1st, Mr. J. Roberts, gr. to Messrs. Rothschild, at Gunnersbury Park, rather small, compact, well-formed bunches, colour and bloom being fair; 2d, Mr. J. Hudson, gr. to H. J. Atkinson, Esq., Gunnersbury House, well coloured, smallish bunches, bloom somewhat deficient; 3d, Mr. Spencer, gr. to H. C. Moffat, Esq., Goodrich Court, Kuss, large sprawling bunches, but with berries having good points.

Two bunches of Black Prince—1st, Mr. Goldsmith, bunches regular in form, good in colour; 2d, Mr. Taylor, gr. to C. A. Paw, Esq., Homefield, Ealing. No others were shown.

Two bunches of Buckland Sweetwater—1st, Mr. Locke, gr. to Colonel Talbot, Outley Court, Windsor, excellent in bunch and berries, and ripe; 2d, Mr. J. Roberts, compact, soft bunches, good in colour; 3d, Mr. J. W. Wall, gr. to Lord Castle, Bloom and colour good, nice bunches, but with some seedless berries. Five lots were shown.

Two bunches of Duke of Beaufield—1st, Mr. Allen, gr. to Lord Suffield, Gunton Park, large berries, but unripe; 2d, Mr. J. W. Wall, gr. to Mr. J. W. Wall, gr. to the Rev. W. Sneyd, Keele Hall, the berries were of a great size, and were liberally thinned; 3d, Mr. Goodacre. Four lots were shown.

Two bunches of Foster's Seedling—1st, Mr. J. Roberts, with fine handsome bunches—colour a rich yellow; 2d, Mr. G. T. Miles, gr. to Lord Carrington, Wycombe Abbey, with bunches as large as the foregoing, but looser; 3d, Mr. Ward, gr. Longford Castle.

Two bunches of Gros Colmar—1st, Mr. W. Elphinstone, gr. Shipley Hall, Derby, with medium-sized bunches, good in colour; 2d, Mr. J. W. Wall, gr. to Lord Castle, Bloom and colour good, nice bunches, but with some seedless berries; 3d, Mr. Wright, gr. to C. Campbell, Esq., Gileston Court, Ross. Only the above were shown.

Two bunches of Gros Guillaume—1st, Mr. Ward, gr. Longford Castle—very large, symmetrically formed bunches, colour not good; 2d, Mr. Spencer—loose bunches, colour good, but had suffered in transit; 3d, Mr. G. T. Miles. Four lots were shown.

Two bunches of Gros Maroc—1st, Mr. W. Taylor, with one large bunch and one smaller—large berries, colour and bloom good; 2d, Mr. Wallis—small compact bunches; 3d, Mr. Elphinstone—nice bunches of unequal size. Six lots were shown.

Two bunches of Lady Downes—1st, Mr. Osman, gr. to J. E. Luce, Esq., Chertsey Park, Chertsey, well-formed bunches, not good in colour; 2d, Mr. Hollingworth—bunches too much packed with berries, colour and bloom very good; 3d, Mr. Wallis. Nine lots were shown, but one of these was Mrs. Pince, shown in error.

Two bunches of Madresfield Court—1st, Mr. Taylor, symmetrically bunches, but too many unfertilised berries, colour and bloom were good; 2d, Mr. Bury, gr. to A. Richards, Esq., Forest Hill, symmetrically, smaller bunches, and good in all other points; 3d, Mr. Goodacre, with nice bunches, and all necessary good points. Seven lots were shown.

Two bunches of Mrs. Pearson—1st, Mr. Osman, with bunches of a large size, berries small and uneven, green in colour; 2d, Mr. J. Roberts, small bunches, quite ripe, colour good; 3d, Mr. Wallis. Four lots were shown.

Two bunches of Mrs. Pince—1st, Mr. Pratt, gr. to the Marquis of Bath, Longleat, very massive bunches, size of berries very large, the bloom capital; 2d, Mr. Horsman, gr. to Lord Hestrybury, Hestrybury Park, Wilt, with large bunches, good in colour; 3d, Mr. A. Hill, gr. to W. H. Longley, Esq., M.P., Rood Ashton Court, Trobridge. Five lots were shown.

Two bunches of Muscat Hamburg—1st, Mr. Goodacre, with massive bunches, well shouldered, medium-sized berries; 2d, Mr. Cooper, gr. to Ventnor, Esq.; 3d, Wilmors, Brantley, Kent; 3d, Mr. Horsfield. Five lots were shown.

Two bunches of Muscat of Alexandria—1st, Mr. W. Pratt, with very fine examples, massive, well set up, berries large, and colour a rich yellow; 2d, Mr. Gray, gr. to the Earl of Sandwich, Theobald, Swallow's, solid bunches, of good colour, and fine berries; 3d, Mr. Roberts. Eight lots were shown.

Two bunches of White Tokay—1st, Mr. Hollingworth, with very large bunches, compact, but with many small and uneven berries, with specimens that were smaller, greener, and looser.

Two bunches of any other variety of Grapes—1st,

Mr. Spencer; 2d, Mr. Wells, gr. to B. Ravenshill, Fern Hill, Windsor Forest; 3d, Mr. Hollingworth, with large and compact Trebbiano.

MESSERS. J. CARTER & CO.'S SPECIAL PRIZES.

Best dish of Dedham Favourite Tomatoes.—1st, Mr. T. A. Beckett, Cole Hatch Farm, Amersham; 2d, Mr. W. Waite, Gilesthorpe, Essex; 3d, Mr. Harris, Bradenham, High Wycombe, with Carter's Perfection.

MESSERS. SUTTON & SON'S SPECIAL PRIZES.

For the best six specimens of Sutton's Early Gem Carrots—1st, Mr. Richards, gr. to Lord Normanton, Somerley, Hants, with roots that were stout and thick, like Early Gem, but larger than that kind, and grew; 2d, Mr. Mead, Beckenham, Greenwich; 3d, Mr. K. E. Lye, gr. to W. H. Kingsmill, Esq., Symdymon Court, Newbury.

For the best twelve specimens either of Sutton's Perfection—Sutton's Abundance—Sutton's Maincrop Tomatoes.—1st, Mr. T. Locke, with Maincrop; 2d, Mr. Waite, with Perfection; 3d, Mr. Beckett, with the same kind.

MISCELLANEOUS.

A collection of eighteen Melons, in variety, was shown by Mr. C. J. Goldsmith, they were medium-sized specimens of well known kinds.

Mr. Myles, Wycombe Abbey, showed a large punnet of President Strawberries in capital form.

Mr. Burnett, The Deepdene, Dorking, showed Burredd President d'Artois, an inferior but good looking fruit.

Mr. Blundell showed Florida and Apple Blossom, Messrs. Vilmorin, Andrieux & Co., sent a large collection of Butter Beans, very varied as to colour, which do not look like the Beans we are accustomed to, but they are, nevertheless, very good eating.

Messrs. Veitch & Son, sent a collection of Carrots grown at their trial grounds at Wick, and a very fine selection of Apples grown by them at Fulham.

Messrs. Lane & Son, Bernhamstead, showed excellent Vines in pots, profusely fruited, consisting of Foster's Seedling Alicante, and Black Hamburg.

Messrs. W. Paul & Son, showed a very numerous lot of fishes of Apples.

Mr. Roupell, Harvey Lodge, Roupell Park Road, S.W., showed a variety of Frontignan Grapes in pots; and cut bunches of many of this section which is so approved for richness and piquancy of flavour. Excellent bunches of Muscat of Alexandria, from Mr. Roupell's garden.

The Dahlia Exhibition.

A very pleasant exhibition of Dahlias took place on this occasion, though only three classes were provided, but the competition was decidedly good in all. There were seven competitors in the class for twenty-four distinct blooms, show and fancy varieties being allowed, though only a very few of the latter were shown, and the competition was very keen, and it was necessary on the part of the judges to scan the individual flowers with the closest attention. Eventually Mr. Charles Turner, Royal Nursery, Slough, was placed 1st with a very good lot, though only the quality of those seen at the Crystal Palace on the 31st inst. The Slough flowers consisted of Julia Wyatt, Imperial, Mrs. Gladstone, Harry Keith, Constance, Bendigo (new), Henry Walton, Hugh Austin, Royal Queen, Prince Bismarck, Mrs. Sunbeam, Mrs. E. Finch, James Esmerald, Herbert Turner, Duchess of Albany, Mrs. Foster, Hon. Mrs. P. Wyndham, J. N. Keynes, Mrs. Langtry, Wm. Rawlings, John Standish, Clara, and a seedling. Equal 2d, Messrs. Keynes, Williams & Co., Castle Street Nursery, Salisbury; and Mr. John Walker, oursurymen, 10, Whitehall, London, two standard forms, which indeed when the individual blooms were compared one with the other. Messrs. Keynes & Co. had Imperial, Royal Queen, Henry Walton, Mrs. Langtry, Buttercup, Miss Cannell, Harry Keith, Mrs. Foreman, Wm. Rawlings, George Barnes, Gloire de Lyon, Mrs. Jefford, Thomas Hobbs, Hugh Austin, Mrs. Shirley Hubbard, Charles Wyatt, Harrison Weir, Ethel Britton, General Gordon, Ruby Gem, Mrs. George Rawlings, De-fiance (new), Mrs. Gladstone, and Mrs. Glascock. Mr. Walker had a fine lot, including some fresh clear blooms of Royal Queen, Herbert Turner, Alex. Craigmoad, Mrs. Gladstone, Charles Wyatt, Aene of Perfection, John Henshaw, Mr. S. Hubbard, Mrs. Langtry, Mrs. Rawlings, James Vick, Mr. Walker, Harrison Weir, Julia Wyatt, James Esmerald, Ceraph, John Standish, J. Cheal & Sons, Mrs. Rawlings, Mrs. Dora, Norman Foreman, Mrs. Langtry, J. N. Keynes, Flora Wyatt, and Hope; 3d, Messrs. Rawlings Bros., florists, Romford.

Pompon Dahlias, shown in bunches of not more than ten specimens of two or three varieties, made a very fine display, and their value as decorative objects was seen to the best advantage. Again was Mr. C. Turner ist, with a very fine lot, the blooms medium-sized and even, fresh and bright, the varieties being Louis Rodani, The Juncker, Fair Helen, Darkness, Healy's Edith, Rosalie, White Aster, Constance Von Sternberg, Cupid, Ernest, Eccentric, Thomas Moore, Rosetta, Dora, The Kildive, Gem, Nymph, Golden Gem, Little Princess, Isabel, Favourite, Titania, Fanny Weimer, and Lady Blanche. Equal 2d, Messrs. Keynes & Co. and Messrs. J. Cheal & Sons, with a very fine lot. The former had a fine lot, but a few of the flowers were over large and a little stale. Their leading varieties were Rosalie, Sappho, Gem, Catherine, White Aster, E. F. Jungker, Darkness, Little Duchess, Lady Blanche, Hebe, Isabel, Ernest, Karl Goldberg, Fashley Dora, Norman Light, and Rozetta. Messrs. J. Cheal & Sons had a nice fresh lot, including Little Duchess, Crawley Gem,

Comtesse von Sternberg, Little Bobby, Isabel, Dora, Cupit, E. F. Juncifer, Guiding Star, Favourite, Dark-nose, Fair Helen, Golden Gem, and Prince of Lalpoutins; 31, Messrs. Paul & Son, Old Nursery, Cheshunt. Four stands completed.

There were also four stands of single Dahlias, and it is doubtful if ever before a better collection so admirably arranged was set up than that by Messrs. J. Cheal & Son on this occasion, which won the 1st prize; the varieties were Edith, Mrs. Walker, Paragon, Formosa, Juno, Miss Linaker, Primrose, Rosalind, Mrs. Kermosa, primrose, heavily flaked, and pencilled with bright pink on the margins. White Queen, Helen, Queen, Henry Irving, Miss Bowman, Alba perfecta, Charles Lays, Silver King, Hugo, Amos Perry, Dorothy Fell, Alfonso, Brutus, and Sunset. 2d, Mr. Charles Turner, with a remarkably good collection, shown in excellent bunches, the varieties being Negress, Alba, Lady of the Lake, Fashion, Huntsman, Evening Star, Ellen Terry, Lutea grandiflora, Zephyr, Foxhall, Miss Bowman, Cherry, Rupert, Rosalind, Duchess of Westminster, Harlequin, Paragon, Sunset, Miss Mary Anderson, Dorothy, Defiance, Queen of Singles, Acquisition, and Sunburst. 3d, Messrs. Paul & Son, Old Nursery, Cheshunt.

First-class Certificates of merit were awarded as follows:—

To Messrs. Keynes & Co., for Colontia, a very distinct show variety, but not shown in such good condition as at the Crystal Palace, where it was 1st prize.

To Messrs. Rawlings Bros., for Mr. Theobald, clear lilac pink.

To Messrs. J. Cheal & Sons, for single Dahlia Mrs. Kerwell, a charming striped flower.

Mr. R. Farner had his new yellow seedling, Nellie Tranter, but it did not find the same amount of recognition here as when it was recently awarded a Certificate at the Crystal Palace. There is no doubt but that the storm of Saturday last materially affected the Dahlias, and prevented the seedlings being shown in such good form as if the dry weather had continued.

CRYSTAL PALACE GRAND NATIONAL DAHLIA SHOW.

ALL things considered, the Grand National Dahlia Show on September 3 and 4 was a remarkably good one. Dahlia cultivators are agreed that the season has proved a very trying one. Dahlias were late in making a kindly growth, but when they did so they progressed very fast, aided by the frequent rains of July and the early part of August. The hot weather during the closing days of July told severely on many of the blooms, still a good show resulted. As usual the Dahlia show was arranged under the western portion of the nave.

SHOW DAHLIAS: NURSERYMEN.

There were six competitors in the class for forty-eight blooms, distinct, and two stands—those of Mr. Charles Turner, Royal Nurseries, Slough, and Messrs. Keynes, Williams & Co., Castle Street Nursery, Salisbury, came so close together that the experienced judges were a considerable time in reaching a decision. Eventually they were placed equal 1st, the 1st and 2d prizes being equally divided between them. Some thought that the long flowers had a "pull" over those from Salisbury blooms, but we think the decision of the judges a just and proper one. Messrs. Keynes & Co. had splendid blooms of Imperial, Mrs. Langtry, Mr. Spofforth, Mrs. W. Slack, Harry Keith, Buttercup, Miss Cannell, James Cocker, Cardinal, and Clara Wyatt. Mr. Turner had Mrs. W. Slack and Seedling, Satesman, Harry Keith, John Wyatt, Sunbeam; 3d, Mr. William Boston, Manor Farm Nurseries, Carthorpe, Bedale; 4th, Messrs. Heath & Son, nurserymen, Cheltenham.

In the class for twenty-four show varieties for nurserymen, not showing in the previous class:—Seven collections were staged, and Mr. John Walker, nurseryman, Thame, was 1st with a very good stand indeed, consisting of Rebecka, J. N. Keynes, Mrs. Rawlings, Vice President, Mrs. F. Keynes, Mrs. Shirley Hibberd, George Bowdins, Annie Neville, Flora Wyatt, 2d, Messrs. Charles Kimberley & Son, Stoke Nursery, near Coventry, whose best flowers were Barnaby Rudge, Harrison Weir, Mrs. F. Foreman; 3d, Messrs. Harkness & Sons, nurserymen, Bedale, Yorks; 4th, Messrs. Salmatsh & Sons, nurserymen, Chelmsford.

In the class for twelve blooms, open to those who had not competed in the two preceding ones, there were four competitors, and the prizes were awarded as follows:—1st, Messrs. G. Kingston, Langley, Chippenham; 2d, Messrs. Rawlings Bros., florists, Romford; 3d, Messrs. J. Burrell & Co., Howe House Nurseries, Cambridge; 4th, Messrs. J. Cheal & Son, Lowfield Nurseries, Crawley.

SHOW DAHLIAS: AMATEURS.

The class for twenty-four varieties brought four competitors, and Mr. R. Penfield, gr. to A. J. D. Dahlia, Esq., Dickinson, Buntingford, was 1st, with a remarkably good lot; 2d, Henry Glasscock, Esq., Rye Street, Bishop's Stortford; 3d, Mr. Thomas Hobbs, Lower Easton, Bristol.

In the class for twelve varieties, there were fourteen competing collections, the 1st prize was awarded to

Mr. Charles Hockney, Greenfield House, Stokesley; 2d, Mr. J. R. Tranter, upper Assenden, Henley-on-Thames; 3d, Mr. W. H. Aphorpe, Albion Brewery, Cambridge.

In the class for six varieties, there were ten collections, and here Mr. Jas. Perkins, London Road, Chippenham, was 1st with Mrs. Langtry, Mrs. Gladstone, James Stephen, Hope, Mrs. Harris, and Aurora; 2d, Mr. A. Tunbridge, gr. to the Rev. Wm. Trimmer, Broomfield, Chelmsford; 3d, Mr. H. Steer, New Eltham, Kent; 4th, Mr. T. W. Girdlestone, Sunningdale, Berks.

FANCY DAHLIAS: NURSERYMEN.

There were four collections of twenty-four varieties, and Messrs. Keynes, Williams & Co. were 1st with a superb collection, consisting of James O'Brien, Duchess of Albany, Pelican, General Grant, Gaiety Sport, Miss Letty Lurge, Fanny Sturt, Hercules, Adventure, Gaiety, Rev. J. B. McComm, Henry Eckford, Mrs. Frisleton, and Charles Wyatt; 2d, Mr. Charles Turner, with good blooms of the following:—Grand Sultan, Professor Fawcett, Chorister, and Hugh Austin; 3d, Mr. W. Boston; 4th, Mr. E. Clarke, Kody, near Lewes.

In the class for twelve varieties there were nine competing collections, and Mr. John Walker was 1st with Clara Wyatt, John Suter, Fanny Sturt, Flora Wyatt, John Forbes, Professor Fawcett, Tippy Bk, Chorister, Peacock, Miss Browning, Florence Stark, and Prospero—a very good lot indeed; 2d, Mr. G. Humphries; 3d, Mr. M. Campbell, nurseryman, Auchincraith, N.B.; 4th, Messrs. Paul & Son, Old Nurseries, Cheshunt.

FANCY DAHLIAS: AMATEURS.

In the class for twelve varieties, Mr. C. Hockney was 1st with a good lot, consisting of George Barnes, Fanny Sturt, Gaiety, and Mrs. N. Halls; 2d, Mr. K. Petfield; 3d, Mr. H. Vincent, gr., Keymer. Five collections competed in this class.

In the class for six varieties, there were fifteen collections, and Mr. Arthur Whitton, Askew, was 1st with Mrs. N. Halls, Hugh Austin, Florence Stark, and Topsy Peck, Mrs. Saunders, and Clara Wyatt; 2d, Mr. J. T. West, gr., near Deal, Esq., Cornwall, Brentwood; 3d, Mr. Jas. Perkins, Chippenham.

PREMIER FLOWERS.

The best show Dahlia selected from the entire exhibition was John Standish, shown by Mr. John Walker; and the best fancy variety, Henry Eckford, shown by Messrs. Keynes, Williams & Co.

POMPON DAHLIAS.

These were as usual finely shown in bunches of not more than ten varieties, and they made a very fine display, as four collections competed. Mr. C. Turner was 1st in the class for twenty-four varieties with a remarkably fine lot; 2d, Messrs. Keynes, Williams & Co.; 3d, Messrs. J. Cheal & Sons, Crawley; 4th, Messrs. J. Gilbert & Sons, St. Margaret's Nursery, Ipswich.

In the class for twelve bunches, open to those not competing in the previous one, there were seven competitors.—Messrs. Paul & Son, Cheshunt, were placed 1st with a fine lot; 2d, Mr. J. Henshaw, Rothamsted Cottage, Harpenden; 3d, Messrs. J. Burrell & Co., Cambridge; 4th, Mr. W. H. Aphorpe.

In the class for six varieties there were five competitors, Mr. Henry Glasscock, Bishop's Stortford was placed 1st, with varieties unnamed; 2d, Mr. J. G. West, Brentwood; 3d, Mr. A. Tunbridge, Broomfield; 4th, Mr. J. Lullard, 59, Vauxhall Street, Norwich.

SINGLE DAHLIAS.

These also were a very fine feature, the large bunches being well displayed; a little foliage proving of great assistance in setting off the bunches to the best advantage. Five collections competed, Mr. Charles Turner, Harpenden, 1st, with very fine examples; 2d, Messrs. Keynes, Williams & Co.; 3d, Messrs. J. Cheal & Sons; 4th, Messrs. Paul & Son.

THE TURNER MEMORIAL PRIZE.

Three competitors entered the lists in competition for the ownership of the Memorial Cup, including the winner last year—Mr. H. Glasscock. On this occasion the award of the judges was in favour of Mr. J. T. West, Cornwalls, Brentwood, with the following eighteen flowers, viz., twelve show and six fancy Dahlias.—Wm. Rawlings, Mrs. Langtry, Charles Wyatt, Mrs. Gladstone, Ponce Salmatsh, T. J. Salmatsh, Mrs. Shirley Hibberd, J. W. Lord, Miss Cannell, Goldfinger, Vice President, and Mrs. P. Wyndham. Fancies: Harry Eckford, Chorister, Mrs. N. Halls, Gaiety, Hugh Austin, and Pelican. Mr. Henry Glasscock was 2d; and Mr. Thomas Hobbs 3d in order of merit.

The Fruit Show.

This division of the show must be considered, as a whole, to have been equal to any that have been held

at the Crystal Palace; indeed, in the class of fruiterer's exhibits and in the number of collections and excellence of the productions of which the same consisted. The arrangement of the fruits on short tables permitted the company easy access to all parts, although it somewhat mixed up the different classes.

Muscats Grapes were not so rich in colour as we have seen them, but there was no lack of size and good finish either in those or in any other class of Grapes. Peaches, Plums, and Nectarines which have ripened quickly during the late hot weather have gathered higher tones of colour from the bright light, presenting a remarkable contrast to the slow ripening Muscats.

Mr. Goodacre of not less than twenty kinds.—Mr. J. H. Goodacre, gr. to Lord Harrington, Elvaston, Derby, was awarded 1st prize. Of the various kinds observed the Pines, a Cayenne, and a Queen were nice fruits of medium size, Grapes Muscats of Alexandria, Foster's Seedling, Victoria Nectarines, and Hemsick Apricots were particularly fine. Mr. McIndoe, gr. to Sir J. W. Pease, Bart., M.P., Guisborough Park, Yorkshire, took the 2d prize; and Mr. J. Roberts, gr. to Messrs. Rothschild, Gunnersbury House, Acton, was 3d. Many competent persons thought the last shown had been placed 1st so good were the various fruits composing the collection.

Twelve dishes.—In this competition Mr. Roberts reversed his default in the big class by taking the 1st prize, his best things being Wm. Tiley Melon, La Grosse Suisse Strawberry, of fine size and colour; and Peach Marquis of Downshire, an excellent lot to have got together after potting together the twenty dishes required for the 1st class. 2d, Mr. McIndoe, who had three bunches of Trebbiano, of a fine colour; Golden Eagle Peach, quite brilliant in hue; Humboldt Nectarine, and Bon Chretien Pears, and other of fine quality. 3d, Mr. Miller, gr. to W. H. Long Esq., M.P., Trowbridge.

Eight dishes.—Mr. Pratt, gr. to the Marquis of Bath, Longlat, was here placed 1st, his best fruits being Black Hamburgs, massive bunches, medium-sized berries, inclining to red; Muscats of Alexandria, fair bunches, but not ripe; Nectarines, Pine Peaches, Melon, Plum, comprised the other fruits shown. 2d, Mr. S. Pullman, gr. to R. E. Sheridan, Esq., Frampton Court, Dorchester, whose Muscats were fine massive bunches, but unripe; Diamond Peaches, Pine-apple Nectarine, were good specimens of cultivation. 3d, Mr. Oclec, gr., Buckling Hall, Aylsham.

COLLECTION OF TEN KINDS OF GRAPES.

Mr. Goodacre brought a fine collection, consisting of Madresfield Court, Muscat of Alexandria, Duke of Buccleuch, Alnwick Seedling, Muscat Hamburg, Lady Downes, and others, these being the best specimens. 2d, Mr. H. W. Ward, gr. to the Earl of Palmer, Longford Castle, whose Muscat of Alexandria, Buckland Sweetwater, Black Alicante, and Foster's Seedling, were very good samples. Mr. W. Wildsmith, gr. to Viscount Eversley, Heckfield, Hants, took the 3d, showing Black Alicante, White Tokay, Golden Queen, Madresfield Court, Alnwick Seedling, and Gros Maroc.

Five kinds of Grapes.—1st, Mr. Taylor, gr. to J. Chaflin, Esq., Bath, well-berried Madresfield Court, with beautiful finish; Muscats, symmetrical bunch, but small of berry. 2d, Mr. Alcock, good solid bunches, up to 3 lb. each, very large-berried; Gros Maroc, and solid bunches of Alnwick Seedling, not enough thinned; 2d, Mr. W. Pratt, whose Muscats were fine in berry and bunch; the Black Hamburgs were likewise large in bunch, but with small berries. Mr. Elphinstone, gr., Shipley Hall, Derby, was 3d.

Black Hamburg Grapes, three bunches.—1st, Mr. Pratt, with broad-shouldered bunches, berries close, and a fine bloom; 2d, Mr. Moorhouse, gr. to J. W. Temple, Esq., Tunbridge Wells, with bunches that were large and loose, but of good colour; 3d, Mr. Howe, gr. to H. Tate, Esq., Sreatham.

Muscat of Alexandria Grapes, three bunches.—In this contest Mr. Pratt again obtained the 1st prize with bunches, large and irregular as to outline, but with very fine large berries, fairly well coloured; 2d, Mr. J. Roberts, with large bunches, well coloured and ripe; 3d, Mr. Goldsmith, gr. to Mrs. C. A. Hare, Kelby Manor, Beckenham, small bunches, and of the colour good.

Gros Maroc Grapes, three bunches.—Mr. Elphinstone took 1st prize with large bunches, finely finished. The 2d prize fell to Messrs. T. F. Rivers & Son, Sawbridgegworth, who also showed well; 3d, Mr. McIndoe, of Hutton.

Madresfield Court Grapes, three bunches.—Mr. J. Bury, gr. to J. Richards, Esq., Forest Hill, took 1st, with bunches perfect in every point; 2d, Mr. H. Perkins, gr. to the Right Hon. W. H. Smith, M.P., Henley-on-Thames, whose Grapes possessed enormous berries for the variety; 3d, Mr. F. Jerdan, gr. to R. Foster, Esq., The Hill, Witley, Surrey.

Alicante Grapes, three bunches.—Mr. W. Howe took 1st with fairly good bunches, in which the berries

were small; 2d, Mr. Pratt; 3d, Mr. Tidy, gr. to J. R. Holland, Great Stanmore.

Grapes of any other white kind, three bunches.—Mr. Wallis, gr. to the Rev. W. Sneyd, Keele Hall, Newcastle-under-Lyne, was awarded 1st for medium-sized bunches of Mrs. Pearson; Mr. Bury took the 2d, with Foster's Seeding; 3d, Mr. Perkins, with the same kind. The three bunches weighing 14½ lb. Mr. Ward, of Longford, who is noted for Buckland Sweetwater, showed this variety in fine condition, but failed to win, although we fail to understand the reason for giving the prizes to smaller bunches of kinds that are not intrinsically better Grapes.

Grapes, any other than black, three bunches.—Mr. Ward, Longford, was awarded 1st prize for nice well coloured bunches of Alnwick Seeding; Mr. Hudson, gr. to J. H. Atkinson, Esq., M.P., Gunnersbury, took the 2d prize for the same variety; 3d, Mr. McIndoe, with Gross Colmar.

Pine-apple, Queen, two fruits.—1st, Mr. W. F. Smith, gr. to Mrs. Hyass, Tunbridge Wells; 2d, Mr. McIndoe.

Pine-apples of any other variety, two fruits.—Mr. Ross, gr. Welford Park, Newbury, was awarded the 1st prize for fruits of Smooth Cayenne, respectively of 9 lb. 6 oz. and 9 lb. 2 oz.; 2d, Mr. W. F. Smith, with smaller examples of the same kind. For four dishes of Peach, Mr. McIndoe was 1st, showing Stirling Castle, Golden Eagle, Violette Hativie, and Prince of Wales, large, well-coloured specimens.

Mr. W. Elphinstone took 1st prize for four dishes of Nectarines, showing Violette Hativie, Elruge, Pitmaston Orange, and Pine-apple.

Smaller competitions with hardy fruits were well contested, but were of no particular interest.

Mr. Wingfield took the 1st prize for the trade collections of fruit, of which there were five; all very well supplied with native and foreign productions.

Messrs. Rivers & Son had erected a pretty fruit trophy in the central transept, composed of orchard-house trees in full bearing, that tell in for a large share of admiration, most of the trees being loaded with fruit, and affording an excellent example of what can be accomplished in small pots.

Messrs. Cheal & Son, Crawley, exhibited a collection of thirty-eight dishes of Apples, and twenty-four of Plums.

Mr. G. Bunyard showed fifty-four dishes of Apples, some shoots of Farleigh Damson, to show its extraordinary productiveness, and some few dishes of Pears. From their Sussex nurseries Messrs. W. Paul & Son showed 160 dishes of Apples.

Physalis edulis was shown by Mr. J. Neighbour, Bickley, Kent.

Mr. G. Holliday showed specimens of shoots of the common Bramble under cultivation; these were full of berries in all stages of growth, and were as good as some American kinds about which so much has been said and written.

Messrs. W. Thompson, Clovenford, N.B., showed a basket of Duke of Buccleuch Grape, fine in size, as it usually is seen, but in this case barely ripe.

A bunch of the Trebbiano Grape of 2½ lb. was exhibited by Mr. J. R. Hannah, gr. to Sir H. E. Maxwell, M.P., Whamp Hill, N.B.

CUT FLOWERS.

There was a capital display of Gladioli, Asters, early Chrysanthemums, stove and greenhouse flowers, single Dahlias, Roses, Hollyhocks, Begonias, Zinnias, Pinks, and Carnations.

Messrs. Burrell & Co., were the winners of the 1st prize for a very good collection of Gladioli.

Mr. Watkins, Thame, was placed 1st for Quilled Asters.

Mr. Jones, gr. to J. S. Pope, Esq., Cedar Lodge, Bath, was 1st for French Asters.

Messrs. Webb & Brand, Saffron Walden, were awarded 1st prize for Hollyhocks; and Mr. T. N. Penfold, gr. to the Rev. Canon Bridges, Beddington, secured the 1st prize for a collection of stove and greenhouse flowers.

Mr. N. Davies took the 1st prize for early flowered Chrysanthemums.

Messrs. W. Paul & Son, Waltham Cross, showed many fine boxes of cut blooms of Roses, and Dahlias of various sections; these came from Messrs. Cheal & Sons, and Messrs. Cannell & Son, Swanley.

BRIGHTON AND SUSSEX:

August 25 and 26.

On this occasion the show was held in the western grounds of the Royal Pavilion, the Dome and Corn Exchange adjoining. In these spacious buildings ample room was found for the productions brought together, and the well kept grounds afforded pleasant space for promenading. The present was a good show throughout, and its reputation for first-class productions was fully maintained.

PLANTS.

For six fine-foliage plants and six Ferns in a special

class Mr. Rano, gr. to J. Warren, Esq., Handersoo Park, staged a number of fine specimens, and was awarded the 1st prize. Crotons Warreni and angustifolius were both finely coloured, Pritchardia pacifica and Cycas revoluta were the best examples of foliage plants, and Davallia Mooreana was an immense plant. Dicksonia antarctica and Thyrsopteris elegans were the best of the Ferns.

With eight stove and greenhouse plants in bloom Mr. Meachen, gr. to Mrs. Armstrong, Patcham, took the 1st prize, having Fimelia mirabilis, very fresh and bright; Rondeletia speciosa major, Allamanda nobilis, and Erica Ewersiana, all being well flowered plants; Mr. Hobden took the 2d place, and in whose lot were Allamanda grandiflora and Erica Fairieana, both fresh. With four plants the same exhibitor was 1st with Erica cerinthoides coronata and E. Attoniana turgida, both being good specimens. He had also a freely bloomed specimen of Statice profusa and another of Allamanda; Mr. Rano was 2d in this class with well grown Ericas and other plants. In the 3d prize set of four from Mr. Jupp, gr. to G. Boulton, Esq., Eastbourne, was a very fine plant of Eucharis amazonica.

ZONAL PELARGONIUMS.

These made a brilliant display, Mr. Hobden taking 1st with doubles, staging a set of well-grown plants; Mr. Meachen and Mr. Townshend, gr. to Captain Thompson, Whitdean, being the most successful in the class provided for single varieties, each exhibitor showing neat well-flowered examples.

GROUPS.

Several classes were provided for groups arranged for effect, in which Begonias and Ferns each had a class to themselves, a very pretty effect being made with each, Mr. Spottiswood, gr. to G. Duddell, Esq., Queen's Park, being 1st in the former, and Mr. Townshend in the latter class. A few Lilies interspersed among the Ferns would have much enhanced the effect.

For a group of mixed flowering and foliage-plants Mr. Turner, gr. to Major Way, Wick Hall, was deservedly 1st, having a light and bright arrangement; Mr. Meachen coming 2d, but more closely packed together.

Messrs. Balchin & Sons and M. W. Miles, both nurserymen of Brighton, each arranged a group of plants of large dimensions, which produced a fine effect, and added greatly to the general finish in the Corn Exchange; large Palms, Yuccas, Crotons and Musas being very telling, and both not for competition.

CUT FLOWERS: DAHLIAS.

This section is always an important feature at this show, and again made a splendid array, Messrs. Keynes & Co., Salisbury, taking 1st both for forty-eight show and twenty-four fancy varieties; whilst for pompons and single kinds in the large classes Messrs. Cheal & Son, Crawley, staged well, and won in both cases.

In the smaller classes Mr. Vincent, gr. to Mr. J. Hart, Keymer, secured no less than six 1st prizes for show, fancy, and single varieties; being closely followed up by Mr. Simmonds, gr. to the Rev. R. C. Hales, Woodmanck Rectory.

CUT ROSES

were, for the season, very good indeed, and some beautiful boxes were shown by trade growers and amateurs.

For twenty-four trebles, for twelve do., and for twelve Teas and Noisettes, Mr. Piper, Uckfield and Pitdown Nurseries, secured the 1st prize in each instance, his boxes being strong in Teas, among which we noted Madame Berard, Niphotes, Marie van Houtte, Jean Ducher, Souvenir d'Elise Vardon, and Belle Lyonnaise, all in capital condition; and in the first-named class Messrs. Balchin & Sons were 2d, with a bright lot of good blooms; Mr. Slaughter, of Steyning, taking the other two 2ds with good stands, as well as being the most successful exhibitor in the amateur classes.

STOVE AND GREENHOUSE CUT FLOWERS.

Mr. Archer, gr. to Mrs. Gibson, of Saffron Walden, secured the 1st prize, with a fine boxful of the best kinds in season, he being strong in Dipladenias and Ericas. The same exhibitor was lucky in taking the 1st for twenty-four quilled Asters, a more varied lot being 2d from Mr. Walker, of Thame; the order was, however, reversed for twenty-four tasselled varieties, which was a very strong class.

HARDY HERBACEOUS PLANTS (CUT BLOOMS).

Messrs. Balchin staged a beautiful selection, which made a fine display, and easily secured the 1st award; he was followed by Messrs. Cheal.

For Gladioli Messrs. Balchin were placed 1st, with a good selection.

FRUIT.

This is always an important feature in this show, a quantity of first-class produce being again shown.

COLLECTIONS.

For a collection of twelve dishes, Mr. Goldsmith, gr. to C. A. Hoare, Esq., Beckenham, was placed 1st, his best dishes being Black Hamburg and Muscat of Alexandria Grapes, Bellegrade and Noblesse Peaches, and Brown Turkey Figs. Mr. Waterman, gr. to H. A. Brasse, Esq., Maidstone, coming in 2d, with a good collection, including a well finished Pine-apple.

GRAPES.

Grapes were shown in quantity in six classes provided for them.

For Muscats (three bunches), Mr. Duncan, gr. to C. T. Lucas, Esq., Wartham Court, took 1st in both divisions.

For six bunches of the same kind Mr. Goldsmith was 1st, each exhibitor staging well finished examples.

With Eack Hamburgs, Mr. Spottiswood was placed 1st also, taking the same award for six bunches of the same kind, as well as taking three 2ds for Muscats, staging well in each case.

For a collection of Grapes, six kinds, Mr. Gore, gr. to Captain Taylor, Glenleigh, Hastings, was awarded 1st, Alawick Seeding and Mrs. Pearson, being the best finished kinds in the collection.

Peaches were shown in first-rate order by Mr. Hopkins, gr. to R. Thornton, Esq., High Cross, Framfield, his fruit of Barrington being very fine.

VARIOUS FRUITS.

Nectarines were shown in best condition by Mr. Duncan, who won in each instance with highly coloured fruit of Pine-apple.

Pears were best represented by Mr. Goldsmith, with Williams' Bon Chrétien; Mr. Waterman taking 2d, with Jargonelle.

With Apples, single dish, the last-named exhibitor put up a fine lot of Peasgood's Nonsuch, and took 1st for culinary kinds; Mr. Cooke showing A-trachan, and taking the same position for dessert kinds.

For a collection of six kinds of Apples Mr. Booth, gr. to W. Yates, Esq., Uckfield, showed a good selection, and took the premier award.

Figs were not shown in such numbers as usual, but good dishes were put up by Mr. Butler, who was an easy winner with Brown Turkey.

Plums and Green Grapes were shown in considerable quantity, Mr. Inglis, of Cuckfield, and Mr. Vincent taking the 1st awards.

VEGETABLES.

Vegetables were provided for in seventeen classes, the competition, as usual in this section whenever shown at this season of the year, was keen, and the quality first-class. With eight as well as with six kinds, Mr. Waterman was a most creditable winner, with the best things in season.

Tomatoes were a strong class, a heavy lot of Trophy taking 1st for Mr. Goring; Mr. Goldsmith following with Stamfordian.

Messrs. Cheal staged (not in competition) several good dishes of fruit, chiefly Apples and Plums. *H.*

MOOR PARK COTTAGERS' HORTICULTURAL:

TURAL:

This Society held its twenty-second annual show in the old pleasure grounds of Moor Park, the domain of Lord Ebury, the President, on Wednesday, August 18. The grounds of the Park looked at their best, and the new pleasure grounds were all ablaze with colour. A grand old Park with deer, a noble mansion, ornamental waters, and terraces, a magnificent and so spacious a country, and what spot could be better chosen for a flower show? The competition was entirely amongst the cottagers, who filled a large tent 100 x 50 feet with their produce, all of first-class quality. The centre of the tent was arranged with groups of flowering and foliage plants kindly sent by the neighbouring nobility and gentry.

Lady Hume Campbell (gr. Mr. Brush) showed an excellent collection of herbaceous cut flowers, and also filled one small tent with tuberous-rooted Begonias in flower. Another large tent was filled with flowering and foliage plants from the Moor Park gardens, arranged in three groups in the centre, which had a most pleasing effect, and was much admired.

The fruit tent was filled with collections of almost everything in and out of season, from Pine-apples down to the commonest bush fruits, contributed by Messrs. Mundell, Myers, Fitt, Gough, Condie, and Bye, not for competition. In this tent, Miss Fitzgibbon arranged an elegant table decoration, which received a special commendation.

There were besides a honey tent, a tent filled with cut blooms from the Moor Park gardens, and a design arranged and planted of a flower garden, by Mr. C. Fletcher, foreman gardener, Moor Park.

One great feature at the flower show was a tent devoted entirely to wild flowers, arranged in baskets by children. The baskets were found by the Society, and had a much better effect than when put up in

every conceivable variety of vessel or basket. The number of baskets averaged from sixty to 100, and a great many of the collection were named, for which there is a special prize offered, as well as for arrangement.

Such exhibitions as these encourage the cottagers, not only to produce good vegetables for exhibition, but also to take a pride in their gardens, for which there are liberal prizes offered for allotments of 20, 15, and 10 poles, situated at Rickmansworth and Mill End, some 2 miles apart.

Allotments are let to cottagers with families, at a mere nominal rent, by the President, Lord Ebury, a system that was adopted many years since, and which has proved a boon to a great many persons.

SCOTCH NOTES.

CONTINUOUS FLORAL DISPLAY IN THE INTERNATIONAL EXHIBITION, EDINBURGH.

In addition to the names mentioned in recent issues, as taking part in the floral display in the grand hall of the Exhibition, Mr. Campbell, of High Blantyre, Glasgow, has since put in an appearance with a superb lot of double Dahlias, a superior batch of fancy Pansies and Carnations and Picotees. The blooms of the latter were especially bright and clean, while they were also characterised by great substance and perfection of form. They had also a very creditable stand of the now rarely seen Holly-hock, which, if inferior to the blooms of the time prior to the appearance of the disease, were yet fairly good, and were welcomed by florists as a hopeful sign that the old flower may again be the source of pleasure in the future as it was in the past.

Messrs. Dickson & Co., Edinburgh, exhibited a box of blooms of their new Caration, Scotia, a showy self, with some resemblance to Grenadier, but of a distinct shade of colour, being soft cerise-scarlet.

Messrs. Lumont & Son, Edinburgh, showed, in addition to their fine display of single Dahlias, a few blooms of a very remarkable form of Liliun auratum. The flowers are from 14 to 15 inches from tip to tip of the petals, and of correspondingly great breadth, but the most remarkable feature about the variety is the broad ray, averaging half an inch in width, of deep maroon-crimson, which extends from the base to near the tip of each petal. It is the richest and most distinct variety of this noble Lily that we have seen.

The Weather.

- Sept. 2.—Fine but dull; wet after 3 P.M.
- 3.—Fine day throughout.
- 4.—Heavy shower at 8 A.M. and 11 A.M., but fine afterwards.
- 5.—Fine, and warm day.
- 6.—Fine, but generally dull; slight shower in night.
- 7.—A very fine day.
- 8.—Fine, but generally dull after 3 P.M.

LONDON: Atmospheric Pressure.—During the week ending September 4, the reading of the baro-

meter at the level of the sea increased from 30.05 inches at the beginning of the week, to 30.07 inches by the morning of the 29th, decreased to 30.01 inches on the same day, decreased to 30.10 inches by 9 A.M. on the 31st, decreased to 30.05 inches by 5 P.M. on September 2nd, increased to 30.15 inches by 1 P.M. on the 3rd, and was 30.03 inches at the end of the week.

The mean reading of the barometer for the week at the level of the sea was 30.07 inches, being 0.01 inch higher than last week, and 0.01 inch above the average of the week.

Temperature.—The highest temperature in the shade in the week was 86°.5 on the 31st; the highest on the 2nd was 66°.2. The mean of the seven high day temperatures was 77°.7.

The lowest temperature in the week was 51°.0 on the 29th; the lowest on the 4th was 61°.0. The mean of the seven low night temperatures was 57°.4.

The greatest range of temperature in one day was 31°.5 on the 30th; the smallest was 80°.2 on the 2nd. The mean of the seven daily ranges was 20°.3.

The mean daily temperatures were, 63°.3 on the 29th; 72°.3 on the 30th; 72°.4 on the 31st; 71°.9 on Sept. 1st; 59°.6 on the 2nd; 63°.0 on the 3rd; and 67°.2 on the 4th. These were all within their averages by 3°.2, 12°.3, 12°.6, 12°.5, 12°.5, 0°.3, 3°.9, and 8°.4 respectively.

The mean temperature of the week was 67°.1, being 3°.0 higher than last week, and 7°.6 above the average of the week.

The highest reading of a thermometer with blackened bulb in vacuo placed in the full rays of the sun was 140° on the 31st. The mean of the seven readings was 117°.7.

Rain fell on two days to the amount of 0.16 inch.

ENGLAND: Temperature.—During the week ending September 4, the highest temperatures were 86°.7 at Cambridge, 86°.5 at Blackheath, 83°.0 at Leeds; the highest at Plymouth was 71°.2, at Truro 70°.0, and at Liverpool, 77°.1. The general mean was 79°.9.

The lowest temperatures were at Truro and Cambridge 47°.0, at Wolverhampton 47°.3; the lowest at Bradford, Leeds, and Newcastle, was 52°.0, and at Blackheath, Nottingham, Liverpool, and Hull, 51°. The general mean was 50°.

The greatest ranges were at Cambridge 39°.7, at Blackheath 35°.5, and at Wolverhampton 32°.3; the least ranges were at Plymouth 22°.7, at Liverpool 26°.1, and at Bradford 26°.6. The general mean was 29°.9.

The mean of the seven high day temperatures was highest at Blackheath 77°.7, at Cambridge 77°.5, and at Leeds 74°.5; and lowest at Plymouth 67°.6, at Liverpool 68°.9, and at Truro 69°.4. The general mean was 72°.

The mean of the seven low night temperatures was highest at Blackheath, 57°.4, at Preston and Newcastle, 56°.6; and was lowest at Wolverhampton, 51°.2, at Cambridge 55°.3, and at Hull 53°.6. The general mean was 55°.1.

The mean daily range was greatest at Cambridge 24°.2, at Blackheath 20°.3, and at Wolverhampton 19°.0; and was least at Plymouth 12°.1, at Liverpool 12°.8, and at Newcastle 14°.0. The general mean was 26°.9.

The mean temperature was highest at Blackheath 67°.1, at Cambridge 63°.9, and at Leeds 63°.8; and was lowest at Wolverhampton 59°.6, at Plymouth 60°.1, at Truro and Bristol 60°.7. The general mean was 62°.1.

Rain.—The largest falls were at Wolverhampton 1.66 inch, at Truro 0.99 inch, and at Bristol 0.44 inch. The smallest falls were 0.06 inch at Newcastle, 0.02 inch at Preston, and 0.00 inch at Hull and Leeds. The general mean fall was 0.34 inch.

SCOTLAND: Temperature.—During the week ending September 4th, the highest temperature was 74°.7 at Paisley; the highest at Greenock was 69°.2. The general mean was 72°.6.

The lowest temperature in the week was 36°.8 at Aberdeen; the lowest at Greenock and Leith was 46°. The general mean was 43°.

The mean temperature was highest at Edinburgh, 60°.9; and lowest at Perth, 57°.7. The general mean was 59°.1.

Rain.—The largest fall was 0.70 inch at Greenock, and the smallest was 0.00 inch at Dundee and Aberdeen. The general mean fall was 0.25 inch.

JAMES GLAISHER, F.R.S.

SUMMARY OF TEMPERATURE, RAINFALL, AND DURATION OF BRIGHT SUNSHINE in the United Kingdom, for agricultural and sanitary purposes, for the week ending Monday, September 6, 1886, issued by the Meteorological Office, 116, Victoria Street, London, S.W. General remarks.—The weather was generally very fine and warm during the earlier part of the period, but subsequently became dull and unsettled, with a good deal of thunder and lightning. The darkness which accompanied the thunderstorm of Saturday morning in the south was remarkably dense.

The temperature has varied from 3° to 5° above the mean over central, southern, north-eastern, and eastern England, but in all other parts of Great Britain the excess has been very slight, while in "Ireland, S.," a deficit of 1° is shown. The highest of the maxima, which was registered on August 31, ranged from 69° to 72° in Ireland and Scotland, but over the greater part of England they were considerably higher, ranging from 80° in "England, N.E.," to 86° in "England, E.," and 87° in "England, S." The lowest of the minima, which were recorded on different days in the various districts, ranged from 34° in "Ireland, N.," and 37° in "Scotland, E.," and "England, N.W.," to 49° in "England, S.," and 52° in "England, E.," and the "Channel Islands." At the commencement of the period the minima in Scotland were very high; at Nairn and Leith the thermometer during the night of August 31—September 1 did not fall below 62°.

Rainfall has been more than the mean in "Scotland, W.," the "Midland Coys.," "England, S.," and "England, S.W.," and about equal to it in "England, N.W.;" but in all other districts it has been less than the mean value.

Bright Sunshine shows an increase in Ireland and Scotland, but a decrease over England; the percentages of the possible amount of duration varied from 15 to 30 in the "grazing districts," and from 26 to 47 in the "Wheat-producing districts."

Depressions Observed.—At the commencement of the period a depression was travelling north-eastwards outside our extreme north-westerly coasts, causing fresh southerly to south-westerly winds at all our western and northern stations. As this passed off, however, the anticyclone previously existing over the south-eastern parts of our area spread westwards, and by the 3d a new anticyclone had been formed over Ireland. Under these conditions the wind became light and variable, and the only depressions observed were some very shallow ones over the north of France and the south of England. Towards the end of the week pressure gave way decidedly in the west, and the disturbances in the south and south-west began partly to fill up, and the remainder to pass over our extreme western districts, while the wind returned to the southward and south-westward.

Answers to Correspondents.

BATH SHOW, &c.—Owing to the pressure on our space, we are obliged to defer the publishing of the report of the Bath Show, and other matters until our next issue.

BERBERIS AQUIFOLIA BERRIES: Enquirer. These berries are not poisonous, wine being sometimes made from them, which is good in flavour and of considerable strength. We have not seen preserves made from them, nor is it at all likely that it is unwholesome for the pucker being wholesome himself in body and judicious in mind.

BOOKS: W. R. Loudon's Trees and Shrubs; Hemley's Handbook of Hardy Trees, Shrubs, and Herbaceous Plants (Longmans & Co.).

DAMSONS: A. Henderson. They are fine fruits, and early, and if prolific your seedling has money in it.

FLOWERS IN SEASON: McLearning. The flowers left at our office were all well-grown samples, being both strong and healthy. The Anthurium, to us, appeared like a pink variety of Scherzerianum, and was very pretty. The Cactleya is, we imagine, a white form of Gaskelliana, and is a capital one too. The other Orchid was a very fine Saccolabium Blumei (perhaps majus). See figure in Gardeners' Chronicle, May 2, 1885, p. 573, vol. xxiii.

JUDGING AT THE CRYSTAL PALACE SHOW, SEPTEMBER 3 AND 4: A. E. The plants you name are often grown under glass, and by the wording of the schedule are not excluded from the list of plants that may be shown. Still, those collections which consisted of stove and greenhouse plants that are not used for outdoor decoration, should, we think, have had the preference, especially, as you state, they were put up with great taste. The judges may have had reasons for their decision, of which others may be in ignorance.

LONDON AGENCY OF FRENCH FLORISTS: A. B. H.

We know of none. NAMES OF FRUITS: J. Ellison. Probably Prince of Wales or Sultan. Cannot be certain without shoots and foliage.

NAMES OF PLANTS: T. H. R. Probably Cratogeomys Douglasi from North-west America, but specimen too scrappy to be certain. J. Walker. Chlora terrata. —F. O. Miltonia candida, not Oudoum.—K. R. W. Scodium Telephium, truly wild. The fungus on Samsons is probably a Puccinia. Please send fresh specimens, packed properly, and we will endeavour to oblige you.—A. B. Is it a wild plant? if so, it is probably Convolvulus soldanella.—Constant Reader, 1. Polystegium lapathifolium; 2. Aparagia autumnalis; 3. Matreana inodora; 4. Schumura dulcamara; 5. Lycium coronaria; 6. Linnaria Cylindrica.

PLUMS: H. L. E. If the seedlings should prove to be prolific, they would make market sorts.

PRIMULAS AND GRUBS: J. Elworthy. The grubs belong to the destructive family of weevils. It is but little use to hunt for the grubs; you must catch the weevils themselves. They are wary insects, and will run into their hiding-places quickly when disturbed when feeding in the evening. By going into a house with a dark lantern, and suddenly turning on the light, the pests are confused, and can be brushed off the plants on to a sheet, and in this way many can be collected and destroyed. Dashing boiling water under stones, and in crevices in the pits and houses, during the daytime will get rid of many, so that by following up the work of destruction from day to day you will get them under.

PROLIFEROUS ROSES: Mrs. W. H. Not uncommon. The end of the stem, which usually stops growing when the flower has formed, in this case has continued to grow.

ROSE: J. S. The flower was too withered to be recognised. It has the appearance of a cross between Niphotes and Celine Foresti.

INTELLIGENT READERS, DO PLEASE NOTE. — Letters relating to ADVERTISEMENTS, or to the supply of the Papers, should be addressed to the Publisher, and NOT to the Editor.

CATALOGUES RECEIVED.

COMPAGNIE CONTINENTALE D'HORTICULTURE (N. LINDEN), Ghent, Belgium—Catalogue of New Plants, &c.

WM. SAMSON & CO., AND W. & T. SAMSON, 8 and 10, Portland Street, Kilmarlock—Roots and Plants.

WM. GORDON, 10, Pall Mall Street, London, E.C.—Orchids and Lilies.

DOBIE & MASON, 66, Deansgate, Manchester—Flower Roots.

CLARK, BROTHERS & CO., 65, Scotch Street, Carlisle—CHARLES TURNER, Royal Nurseries, Slough—Bulbous Roots.

BARR & SON, 12, King Street, Covent Garden, London, W.C.—Bulbs and Plants.

SUTTON & SONS, Reading—Bulbous Flower Roots. WEBB & SONS, Worsley, Stourbridge—Bulbs.

DIED.—We regret to announce the death of Mrs. VIVIAN, of Singleton Park, Swansea, at the age of 85 years. She was an enthusiastic horticulturist, and during her long residence at Singleton, made the garden one of the best furnished and enjoyable in the kingdom.

Markets.

COVENT GARDEN, September 9.

TRADE for all classes of goods heavy. Prices unaltered. James Webster, Wholesale Apple Market.

FRUIT—AVERAGE WHOLESALE PRICES.

Table with 2 columns: s. d. and price. Items include Apples, 1/6-3/6; Figs, 0/6-0/9; Grapes, 0/6-0/6; Raisins, 0/2-0/2; Lemons, per lb. 1/8-0/2-0; Melons, each 1/0-2/0.

VEGETABLES—AVERAGE RETAIL PRICES.

Table with 2 columns: s. d. and price. Items include Artichokes, per doz. 4/0-; Asparagus, each 0/3-; Beans, kidney, lb. 0/4-; Brussels Sprouts, lb. 0/4-; Carrots, per bush 1/0-; Cauliflowers, per doz. 3/0-; Celery, per bundle 1/6-2/0; Cucumbers, each 1/0-; Endive, per dozen 1/0-2/0; Herbs, per bunch 0/4-; Lettuce, per bunch 0/2-; Lettuce, per dozen, 1/0-1/6.

PLANTS IN POTS—AVERAGE WHOLESALE PRICES.

Table with 2 columns: s. d. and price. Items include Aralia Sieboldi, doz. 6/0-8/0; Balsams, per dozen 3/0-6/0; Begonias, per dozen 6/0-12/0; Bouvardias, doz. 12/0-18/0; Cockscombs, dozen 3/0-6/0; Cyperus, per dozen 4/0-12/0; Puccinia terminalis, per dozen 1/0-6/0-0; —viridis, per doz. 12/0-24/0; Euphorbia, in var., per dozen 5/0-6/18-0; Evergreens, in var., per dozen 1/0-6/24-0; Ficus elastica each, 6/0-8/0; Ferns, in var., dozen 4/0-8/0.

CUT FLOWERS—AVERAGE WHOLESALE PRICES.

Table with 2 columns: s. d. and price. Items include Arum Lilies, 12 blms. 4/0-6/0; Asters, 12 blms. 1/0-2/0-4; Bonivardias, per bun. 0/6-1/0; Carnations, 12 bun. 3/0-6/0; Cornflowers, 12 bun. 1/6-3/0; Daisies, common, 12 bunches 2/0-4/0; —Eucharis, per dozen 2/6-4/0; Forget-me-Not, or Myosotis, 12 bun. 2/0-4/0; Gardenias, 12 blooms 2/0-4/0; Gladiolus, 12 sprays, 1/0-2/0; Heliotrope, 12 spr. 0/6-1/0; Hyacinths, white, bun. 0/9-0/9; Lappageria, 12 lb 1/0-2/0; Lavender, 12 bun. 3/0-5/0; Lilium longiflorum, 12 blooms 1/0-4/0-6/0; Marguerites, per 12 bunches 1/0-3/0-6/0; Mignonette, 12 bun. 1/0-3/0; Pansies, 12 bunches 1/0-6/0-0; Pelargoniums, per 12 trusses 1/0-0/9-1/0; —Syringa, 12 trusses 2/0-4/0; Pyrethrums 12 bun. 2/0-4/0; Rhodanthes, 12 bun 6/0-9/0; Roses, Tea, per doz. 0/9-2/0; —red, per dozen 0/9-1/0; —outdoor, 12 bun. 2/0-6/0; Stephanotis, 12 spr. 1/6-3/0; Sweet Peas, 12 bun. 1/0-2/0; Sweet Sultan, 12 bun. 3/0-4/0; Tropaeolums, 12 bun. 1/0-2/0; Tuberoses, 12 blms., 0/4-0/9-0.

SEEDS.

LONDON: September 8.—Messrs. John Shaw & Sons, seed merchants, of 37, Mark Lane, E. C., report to-day's market steady. Trifolium and Winter Tares are in somewhat improved request at Monday's rates. There is also an inquiry for sowing Rye. Supplies of white Mustard are apparently almost exhausted. Rapeseed continues exceedingly cheap. Rather less money is taken for blue Peas; many parcels prove in bad condition. Hemp and Linseed continue to firmly hold their own. White Millet is getting into narrow compass. In Cloverseeds no business is passing. Feeding Linseed tends downwards.

FRUITS AND VEGETABLES.

COLUMBIA (East London): Sept. 8.—This market has been well supplied with all kinds of fruit, veg. & tubers, and has gone steady. Trifolium and Winter Tares are in somewhat improved request at Monday's rates. There is also an inquiry for sowing Rye. Supplies of white Mustard are apparently almost exhausted. Rapeseed continues exceedingly cheap. Rather less money is taken for blue Peas; many parcels prove in bad condition. Hemp and Linseed continue to firmly hold their own. White Millet is getting into narrow compass. In Cloverseeds no business is passing. Feeding Linseed tends downwards.

STRAFORD: Sept. 7.—The market has been well supplied with all kinds of produce during the past week, and with a good attendance of buyers a brisk trade was done at the following prices:—Cabbages, 2s. to 3s. 6d. per tatty; Greens, loose, 3s. to 4s. 1d.; Cauliflowers, 1s. to 1s. 6d. per dozen; Turnips, 2s. per dozen bunches; Carrots, household, 2s. 6d. to 4s. 1d.; Mangels, 2s. to 2s. 6d. per ton; Apples, English, 3s. to 4s. per bushel; do., American, 6s. to 6s. per bushel; Watercress, 6d. per dozen; Peas, hazle, 4s. to 4s. 6d. per bushel; Plums, 2s. per half bushel; Green Gages, 2s. to 2s. 6d. do.; Cucumbers, 6d. per dozen; Tomatos, 1s. to 1s. 6d. per dozen lb.; Marrows, 6d. to 6d. per dozen; Scarlet Runners, 1s. per bushel; Parsley, 1s. 6d. per dozen bunches; Herbs, 2s. 3d. to 2s. 6d. do.

POTATOS.

BOROUGH AND SPITALFIELDS: Sept. 7.—Supplies of the common and middling qualities were large and the trade dull; but prime samples were not so plentiful, and some descriptions of these were finer. Quotations:—Regents, 70s to 95s; Beauty of Hebron, 65s to 95s; and Regents, 55s to 60s. per ton. STRATFORD: Sept. 8.—Quotations:—Roses, 55s. to 100s.; Magnans, 60s. to 65s.; Beauty of Hebron, 60s. to 95s.; and Regents, 55s. to 60s. per ton.

COLUMBIA (East London): Sept. 8.—Quotations:—Magnans, 55s. to 70s.; Beauty of Hebron, 60s. to 70s.; and Regents, 65s. to 70s. per ton.

HAY.

WHITECHAPEL: Sept. 7.—Supplies were not quite so large as at the previous market, in consequence of a rather a better trade at steady prices. Quotations:—Clover, prime, 100s. to 108s.; inferior, 70s. to 85s.; hay, prime, 70s. to 82s.; inferior, 30s. to 65s.; and straw, 27s. to 38s. per load.

Sept. 6.—A fair supply on sale. The trade was quiet at previous prices. STRATFORD: Sept. 7.—Quotations:—Hay, 80s. to 100s.; Clover, 80s. to 100s.; and straw, 30s. to 35s. per load.

CARTERS' EARLY BULBS FOR FORCING. To produce Beautiful White and Coloured Flowers for Christmas Decoration. CARTERS' Earliest White Roman HYACINTHS. The Largest Bulbs of the Year. We do not keep a Second Size. CARTERS' Double Roman NARCISSUS. Per 100, 15s. 6d.; per dozen, 1s. 10d. CARTERS' Paper-white NARCISSUS. Per 100, 10s. 6d.; per dozen, 1s. 6d. CARTERS' Red and Yellow VAN THOL TULIPS. Per 100, 4s. 6d.; per dozen, 4d. CARTERS' Extra Large SNOWDROPS. Per 100, 2s. 6d.; per dozen, 2d. ALL PARCELS CARRIAGE FREE. For further particulars, see Carters' Illustrated Catalogue of Bulbs, GRATIS AND POST-FREE. Seedsmen by Royal Warrants to H. M. the Queen, and His Royal Highness the Prince of Wales. 237 High Holborn, London, W.C.

Kent—The Garden of England. 300,000 FRUIT TREES—true to name.

GEORGE BUNYARD & CO., THE OLD NURSERIES, MAIDSTONE

(Established 1799), will forward, for Six Stamps, their DESCRIPTIVE FRUIT CATALOGUE,

with Illustrations and Cultural Notes (copy-right edition). See Gardeners' Chronicle of Sept. 4, p. 28. The first stock ever offered—clean, healthy, with grand fibrous roots. Frequent trains from London by North Kent and London & Chatham Railways.

EARLY FORCING AND OTHER FLOWERING

BULBS of finest quality, in endless variety, at moderate prices.

THE DARLINGTON GOLD MEDAL DRESS FABRICS

Are now supplied direct from the Manufactory, at Wholesale Price, there being no Intermediate Profits whatever.

HENRY PEASE & CO'S SUCCRS,
 SPINNERS and MANUFACTURERS,
 and Sole Makers of the Celebrated
GOLD MEDAL
DARLINGTON DRESS FABRICS,

Ladies are at liberty to change any goods for others preferred within seven days, and should not fail to see our large box of Autumn and Winter patterns, post free.

As worn by H. R. H. the Princess of Wales, invite Ladies in any part of the world to send DIRECT TO THEM for Patterns, post free, of their new makes for the Autumn and Winter Seasons, which embrace every variety of material a lady can possibly desire, and of which the *Daily News* says:—

The union of warmth to lightness, so necessary to health is in these materials brought to perfection
 The fineness of the wool of which they are composed—English Wool, be it understood—imparts the admirable quality of draping in those soft folds now so essential from the point of view of fashion.

These fabrics were awarded, at the all-England competition, the ONLY GOLD MEDAL, at the BRADFORD TECHNICAL EXHIBITION opened by the Prince of Wales. Also the Highest Prizes at the Exhibitions of 1851, 1855, &c., and wherever exhibited.

AS AN ADDITIONAL GUARANTEE TO LADIES that we are the actual Manufacturers, and not Advertising Dealers or Sales-yield Manufacturers, we subjoin the following Certificate, viz:—

"Having examined the 'RECORD OF WAGES' paid by you, we hereby certify that the number of work-people employed in the PRODUCTION OF YOUR MANUFACTURES was on August 13, 1886,

ONE THOUSAND AND TWENTY-SIX.
 —MONROUSE, GODDARD & Co. Chartered Accountants, Middleborough and London, August 16, 1886."

SPECIAL ATTENTION is directed to our celebrated CROSS-WARP SERGES, which, alike, resist the effects of weather and sea, 10½d. to 3s. per yard; for Men's and Boy's wear (including the "Clerical" Serge), these will be found "clear away" the best value procurable, 2s. to 8s. 6d. per yard (56-in. wide). Our GOLD MEDAL CASHMERE, in all the New Colourings, from 1s. 9d. to 3s. 11d. per yard. NEW and FASHIONABLE COSTUME CLOTHS in great variety, from 6½d. to 5s. per yard, including "The LOWSTOCK," "The ASHEHURST," "The DAMIETTA," "The KHAIBER," "The SHUMLA," "The TARAPACA," "The PANAMA," "The HOLSTEIN," "The ZEELAND," &c.

CHARMING NOVELTIES in SKIRTINGS, including "The YESSO," "The NINGPO," "The FOO-CHOO," &c.

THE DARLINGTON BLANKETS (sent on approbation) are warranted Pure Wool. Money returned if not approved of. In all sizes and four different qualities.

THE DARLINGTON MEN'S UNDERCLOTHING (Pants and Vests), all Pure Wool, are made on our own premises. Sent on approval.

Address—**HENRY PEASE & CO'S SUCCESSORS,**
 SPINNERS and MANUFACTURERS, THE MILLS, **DARLINGTON.** Established, 1752.
 Please mention "Gardeners' Chronicle," in sending for Patterns

The *Daily Telegraph*, of August 20, 1886, in a Leading Article, states:—"Tomato growers in the Channel Islands seem in a fair way of making fortunes. There is no doubt the time is near when the market will be as well supplied with Tomatos all the year round as Cucumbers."

THE GUERNSEY AND JERSEY FRUIT AND PRODUCE COMPANY, LIMITED.

Registered under the Joint Stock Companies' Acts, 1862 to 1883, whereby the liability of the Shareholders is limited to the amount of their Shares.

CAPITAL £20,000, IN 4,000 SHARES OF £5 EACH.

First Issue of £15,000 (3,000 Shares) without premium, a number of which have been already taken up privately. Payable £2 10s. on Allotment, and it is not intended at present to call up more than £2 10s. per Share.

LONDON BANKERS—CAPITAL AND COUNTIES BANK, Head Office and Jersey.
 GUERNSEY BANKERS—COMMERCIAL BANKING COMPANY, High Street.

LONDON OFFICE—4, Tokenhouse Buildings, Bank of England. GUERNSEY OFFICE—Glasshouses and Vineries, Courtil de Jacques.
 MANAGER—HENRY DE JERSEY. SECRETARY—EDWARD OXENFORD PRESTON.

THE GUERNSEY AND JERSEY FRUIT AND PRODUCE COMPANY (LIMITED) has been established for the purpose of Growing Fruit and the Produce generally of the Channel Islands, and also for Receiving such Produce from Growers and Supplying the same direct to Consumers and Retail Establishments. The Trade has hitherto been almost entirely in the hands of private growers, except two local companies which have paid their shareholders from 12 to 20 per cent. dividends, and is well known to be of a most profitable character.

The Directors with confidence recommend the operations of this Company, for which there is a fine opening, as an unusually safe and remunerative investment—safe, because nearly the whole of the Company's capital is being invested in first-class land in Guernsey, and Glasshouses for the Cultivation of Grapes, Melons, Tomatos, Beans, and other Choice Fruits, which are supplied from the Channel Islands into England.

The property of the Company will increase in value with the growth of the Vines.

As showing the Profits derived from dealing in Fruit and Garden Produce of the Channel Islands, the Directors are informed one of the two Companies in Guernsey has paid its Shareholders dividends at the following rates:—

1880, 10 per cent.	} Extensive building operations took place during these years.
1881, 11 " "	
1882, 15 " "	
1883, 15 " "	

The only other Vinery Company which commenced operations recently has paid its Shareholders 12 per cent.

Applications for Shares, stating number required, can be made to the Secretary of the Guernsey and Jersey Fruit and Produce Company, 4, Tokenhouse Buildings, Bank of England, London, E.C.; or to the Company's Bankers. Prospectuses and any information desired will be supplied on application.

Upon a fair estimate, the Directors anticipate a dividend of at least 10 to 12 per cent. on the year's sales.

The Sales of Tomatos from one house only, for the week ending August 7, amounted to a quarter of a ton. The Directors have erected on the Company's Estate, to secure the coming winter crops, which prove very remunerative, the following:—

One 200 feet House.	Six 200 feet House.	One 180 feet House.
Two ditto.	Seven ditto.	Two ditto.
Three ditto.	Eight ditto.	Three ditto.
Four ditto.	Nine ditto.	Four ditto.
Five ditto.	Ten ditto.	Large Vinery, 45 feet wide.

Total, fourteen long Span Glasshouses and large Vinery, making a total of about 50,000 square feet of Glass.

The *Horticultural Times*, June 20 refers to the Company as follows:—

"The development of Market Gardening in the Channel Islands has often been dealt with by us, and we are glad to learn that efforts are being made to still further prove what, under high culture, the land will produce. The Guernsey and Jersey Fruit and Produce Company is a striking example of this. Incorporated only last February—when its estate did not contain a single glass-house—it has now 50,000 square feet of glass erected! Having as local manager one of the most successful growers in Guernsey, with economical management, half the capital only called up, and nearly the whole of the capital invested in freehold land and houses, and of progressing value, this venture will, we predict, succeed. It has sited in the right spot, under the right management, and is raising the right sort of produce. As we write, we have specimens of the Company's first Tomato consignment before us—2000 without heat—and we can vouch for their excellent quality. Colour and size are almost perfect."

H. B. MAY is now offering the above, which is one of the greatest novelties of the season. The Plant is dwarf and compact in habit; the fronds beautifully branched and crested, and the vegetation very distinct. It is one of the most lovely FERNS ever offered. Has been awarded First class Certificates by the Royal Horticultural and Royal Botanic Societies.

Well furnished plants, in 4", 7", 6d. each.
Usual Discount to the Trade.

Dyson's Lane Nursery, Upper Edmonton, Middlesex.

GISHURST COMPOUND, used by leading Gardeners since 1859 against Red Spider, Mildew, Thrips, Green Fly, and other Blights, 1 to 2 ounces to the gallon of soft water; 4 to 16 ounces as winter dressing for Vines and Orchard-house Trees; and in lathe from the cake against American Blight. Has qualified many preparations intended to supersede it. Boxes, 12s. 3s., and 10s. 6d.

GISHURSTINE keeps Boots dry and soft on wet ground. Boxes, 6d. and 1s., from the Trade. Wholesale from PRICE'S PATENT CANDLE COMPANY (Limited), London.

Oil Paint no Longer Necessary.
HILL AND SMITH'S BLACK VARNISH, for Preserving Ironwork, Wood, or Stone.

This VARNISH is an excellent substitute for oil paint or any outdoor work, while it is fully two-thirds cheaper. It was introduced upwards of forty years ago by the Advertisers, and its genuine good quality, notwithstanding a host of unprincipled imitators, is fully attested by its constantly increasing sale. It may be applied by an ordinary labourer, requiring no mixing or thinning, and is used cold. It is used in the grounds at Windsor Castle, Kew Gardens, and at the seats of most of the Nobility and Gentry, from whom the most flattering testimonials have been received.

Sold in Casks of about 20 gallons each, at 12s. 6d. per gallon, at the Manufactory, or 12s. 8d. per gallon carriage paid to any Station in the Kingdom.

UNSOLICITED TESTIMONIAL.
From ALFRED LOWN, Esq., *The Ryper, Alteryk Lodge*.
"Some twenty years ago I used your Black Varnish, and shall be glad if you will forward me a cask, as I consider it the best thing known for the preservation of all outdoor work, either wood or iron, that requires to be painted."
CAUTION—HILL & SMITH would particularly warn their Customers against the various cheap Varnishes now so much advertised.

Every cask is legibly marked with their name and Registered Trade Mark as above, without which none is genuine. Large Illustrated CATALOGUE on Fencing, Hurdles, Field and Entrance Gates, &c., sent free on application to

THE MOST COMPLETE STANDARD WORKS on ORCHIDS.
THE ORCHID ALBUM,

COMPRISING COLOURED FIGURES and DESCRIPTIONS NEW, RARE, & BEAUTIFUL ORCHIDACEOUS PLANTS Cultivated in this Country.
CONDUCTED BY ROBERT WARNER, F.L.S., F.R.H.S., Author of "Select Orchidaceous Plants," AND BENJAMIN SAMUEL WILLIAMS, F.L.S., F.R.H.S., Author of "The Orchard Growers' Manual," &c.
THE BOTANICAL DESCRIPTIONS BY THOMAS MOORE, F.L.S., F.R.H.S., Curator of the Chelsea Botanic Gardens.

The Coloured Figures by JOHN NUGENT FITCH, F.L.S., Dedicated by special permission to Her Royal Highness the Princess of Wales.
Five Volumes, containing 150 Hand-coloured Plates, New ready, Price 15s. unbound, or bound in strong hand-made covers with gilt edges, Price 20s. each.
This Album is issued in Royal Quarto, which enables the Artist to produce ample and intelligible portraits of the plants, which are drawn and coloured by hand in the best style.
The Text comprises English botanical descriptions of the plants figured, notes on their cultivation, and such general observations concerning them as may be likely to prove of interest or utility to Orchid-growers.
The Work is issued regularly in Monthly Parts. Each Part contains four handsomely illustrated Plates, with descriptive Letterpress; and a Volume, consisting of Twelve Parts, is completed annually.
Price 5s. per Part, or 60s. per annum (Twelve Parts) Post free Vols. I., II., III., IV., and V., can be supplied, bound complete, with gilt edges, price 25s. each.

JUST PUBLISHED, THE ORCHID-GROWERS' MANUAL,
Sixth Edition, Enlarged and Revised.

BY BENJAMIN SAMUEL WILLIAMS, F.L.S., F.R.H.S., Author of the "Orchid Album," "Selected Ferns and Lycopses," "Choice Stove and Greenhouse Flowering Plants," "Choice Stove and Greenhouse Ornamental-leaved Plants," &c.
Part 8vo., Cloth, Price 15s.; Price by Parcels Post, 15s. 6d.
Profusely Illustrated with a large number of page and double-page Engravings on Wood, together with Blocks illustrative of types of the various genera.
This popular work has been entirely re-modelled and revised up to the present time, and has been enlarged to 659 pages. It contains descriptions of upwards of 1,270 species and varieties of Orchidaceous plants, together with 475 synonymies; also authorities for the names, the families to which the various genera belong, the flowering period, native country, and references to figures.

WARNER'S WINDMILLS for PUMPING, DRAINAGE, or IRRIGATION. Nothing better in favourable positions.

WARNER'S SIAK WINDMILLS.
 Gold and Silver Medal awarded at Calcutta Exhibition, 1884
Testimonial from a Fruit Grower who uses great satisfaction—works with very light breeze.

"Swanley, Kent, October 15, 1883."
 "Gentlemen—I am glad to be able to inform you that the Wind Engine you hired for me about a year ago gives great satisfaction, as it is very seldom that there is not enough wind to work it, as it works with a very light breeze, even in one direction, where trees shelter it too much.—Yours truly,
 "Messrs J. Warner & Sons."
 "H. STAPLES."
Testimonial from a Scotch Laird, who says it is working admirably, a double engine—saves labour in work.
 "London, W. 14, 4th Avenue, N.E., October 15, 1884."
 "Dear Sirs,—I feel it a pleasure in writing you of the Windmill, which is working admirably so far that it is a decided success, and the price is handsomely saved in my labourous work.—Yours truly,
 "JOHN JAMES STEWART."
 "Messrs J. Warner & Sons."
 Prices a retail give upon application, with details of arrangements.
JOHN WARNER and SONS, Greenock Foundry, Glasgow, London, E.C.; and the Foundry Works, Watton-on-the-Nave, Essex.
 To be obtained of every Ironmonger and Plumber in the Kingdom.

Rosher's Garden Edging Tiles.

THE ABOVE and many other PATTERNS are made in materials of great durability, and are especially suited for KITCHEN GARDENS, as they bar none in strength, and take up little room, and, once put down, incur no further labour or expense.
 as do "grown" Edgings, consequently being much cheaper.
GARDEN VASES, FOUNTAINS, &c. in Artificial Stone, very durable and of superior finish, and in great variety of design.
F. ROSHER AND CO., Manufacturers, Upper Ground Street, Blackfriars, S.E.; King's Road, Chelsea, S.W.; Kingsland Road, E.

TRAVELLER, in the Nursery and Seed Trade.—Has represented a wholesale House all over the Kingdom. Thorough knowledge of all Outdoor Nursery Stock and its value.—R. M., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

HOLLOWAY'S OINTMENT and PILLS.—Though it is impossible in this climate of changing temperature, to prevent ill-health altogether, yet its form and frequency may be much mitigated by the early adoption of remedial measures. When diarrhoea, Cough, tight Breathing, and the attending slight fever indicate irritation of the throat or chest, Holloway's Ointment should be rubbed upon these parts without delay, and his pills taken at appropriate doses, to assist his curative action. No Gouty or Sore Throats can resist these remedies. Printed directions envelope every package of Holloway's medicinal, which are suited to all ages and conditions, and to every ordinary disease to which humanity is liable.

SECTION No. 1.

SPAN FRAME on Iron Standards, 6 or 8 feet wide.

TESTIMONIALS.

From Dr. HOGG, Editor of the "Journal of Horticulture," 171, Fleet Street, London, E.C. March 25, 1880

"GENTLEMEN,—I am much pleased with the House. [A Span Frame 36 by 10 feet, on walls]—Yours truly,
 "ROBERT HOGG."

From HENRY E. TATHAM, Esq., Chesfield, Hampton Wick, April 15, 1885.

"DEAR SIRS,—Thank you for the new Span Moveable Frame, which has arrived in good order. Now that it is up and complete, my Head Gardener is much pleased with it, and says it is the best Frame of the sort that he has ever seen.
 "Yours faithfully,
 "HENRY E. TATHAM."

NEW FRAMES, 12 feet wide, for Fixing on Brick Walls.

TESTIMONIALS.

From Mr. WILLIAM FOX, Gardener to His Grace the Duke of Devonshire, Holker Gardens, Carke-in-Cartmel, Carnforth, June 28, 1884.

"DEAR SIRS,—The two Frames received from you were very easy to fix by the instruction given, and having taken a little time to test them, I am pleased to say they are very satisfactory. Enclosed is a cheque for them from the Duke's agent, Mr. Drewry.
 "I am, yours truly,
 "WILLIAM FOX."

From J. B. BAGEHOT, Esq., Langport, Somerset, February 20, 1885.

"GENTLEMEN,—I am well satisfied with the Frame you sent me.
 "Yours truly,
 "J. B. BAGEHOT."

FINE TOBACCO PAPER AND CLOTH, 2s. per pound. JOHN SHAW, Jun., Bulb Importer and Seed Merchant, 10, The Downs, Bowdon.

SEEDLING BRIEKS.—Any quantity of 2, 3, and 4-year old plants. NEW ROSES of 1885-6.—15s. per dozen varieties (each selection); 3s. per twenty-five varieties (my selection).

My FRENCH CATALOGUE of New Roses sent Post-free. My complete ENGLISH CATALOGUE over two hundred of the very best Roses, with raiser's name and date of sending out of each variety, free for 7d. in stamps. JAMES L. BOYSSON, Cien, Calvados, France.

VIOLETS.—We have an immense stock of all the best in cultivation, strong healthy plants, "Marie Louise and Swaney White" (often absurdly called Count Brazza) in 5-in. pots, much better than clumps for immediate planting in frames, 6s. per dozen; 42s. per 100.

STRAWBERRIES.—All the best Kent kinds, sure to give a crop and satisfactory. In 6-in. pots, 20s. per 100; in small pots 2s. Runner plants, 3s. 4s., and 5s. per 100. H. CANNELL AND SONS, Swanley, Kent.

AFRICAN TUBEROSES. PEARL TUBEROSES, Natal grown. EVERLASTING FLOWERS.

GROWN BY EDWARDS & BELL, Maritzburg.

Our Bulbs have all been raised from Picked Seed, and are "second to none" in the market. Particularly fine and well selected.

FOR PRICES AND TERMS, APPLY TO PERCY J. POOL & CO., 4, BISHOPSGATE STREET WITHIN, E.C.

RHODODENDRONS AND AZALEAS. ISAAC DAVIES & SON

Have pleasure in calling attention to their extensive stock of RHODODENDRONS and AZALEAS of all descriptions, for Planting or Forcing, which are this year healthy, bushy, and well-budded. The AZALEA MOLLIS are remarkably fine and well-budded, and they offer good bushy Plants, full of buds at 1s. 6d. to 2s. per dozen, 12s. to 60s. per 100.

They have also to offer, in quantity, HOLLIES, AUCUBAS, LAURELS, KETINOSPOKAS, Flowering and Ornamental TREES and SHRUBS, LILUM AURATUM, &c.

Their stocks of these are unusually fine, and the prices are very moderate. CATALOGUE'S Post-free on application. Brook Lane Nursery, Ormskirk, Lancashire.

Kent—The Garden of England. 300,000 FRUIT TREES—true to name.

GEORGE BUNYARD & CO., THE OLD NURSERIES, MAIDSTONE

(Established 1796), will forward, for Six Stamps, their DESCRIPTIVE FRUIT CATALOGUE,

with Illustrations and Cultural Notes (copy-right edition). See *Gardener's Chronicle* of Sept. 4, p. 298. The finest stock ever offered—clean, healthy, with grand root-roots. Frequent Trains from London by North Kent and London & Chatham Railways.

AFRICAN TUBEROSES, GROWN BY WM. RISLEY, Maritzburg, Natal.

The Trade and Growers are hereby informed that Mr. RISLEY'S Crop is now landed. The Bulbs are in splendid condition, large and healthy, and altogether such as have never before been offered in the market. Quotations very low. Cases free. Terms, net cash. For prices and full particulars, apply to

WM. G. MAC GREGOR, 17, FENCHURCH STREET, E.C.

A. B. C. BULB GUIDE.

Prepared with very much care, containing much reliable information upon Bulbs generally, including the following families:—

HYACINTHS, TULIPS, CROCUS, SNOWDROPS, CHIONODOXAS, GLADIOLUS, &c.

Very extensive lists of varieties of these are included, consisting of nearly every variety which can be considered worth growing.

IRIS.—Of these I hold one of the finest collections in the world, six pages are devoted to this family alone.

HELLEBORES, or CHRISTMAS ROSES are a great specialty at Tottenham. The collection is very complete, and the plants are exceptionally good. I have thousands of fine, strong, healthy clumps of the varieties major, maxima, caucasic, Madame Fourcade, and many others.

DAFFODILS and LILIES

constitute Part II. of my Bulb Catalogue, Twenty-six pages being devoted to them. Both families are cultivated by me most extensively, my collection including almost every variety in cultivation. These have been shown most extensively during the present season at the Great London Show, and have been very much admired, and have done much to assist in securing for me the many Awards it has been my pleasure to receive.

Copies of this most complete and interesting Catalogue may be had gratuitously upon application to

THOMAS S. WARE, HALE FARM NURSERIES, TOTTENHAM, LONDON.

WHOLESALE BULB CATALOGUE contains Lists of all varieties of English, Dutch, and French-grown bulbs. All first quality and low prices. May be had on application. Special Quotations for Large Quantities of the following:—

- 100,000 SINGLE DAFFODILS. (Peyed.) 50,000 NARCISSUS POETICUS (Pheasant-eyed, blooming three weeks earlier than poeticus. 20,000 LILIUM CANDIDUM (Fine Imported Root). 100,000 SCILLA SIBIRICA, rich blue; blooming same time as the Snowdrop. 10,000 HYACINTHS, mixed, all colours; fine sample, very cheap. 200,000 CROCUS, yellow; three sizes. WATKINS & SIMPSON, Seed and Bulb Merchants, 13, Exeter Street, Strand, W.C.

GARDEN REQUISITES.

CHUBB, ROUND & CO., WEST FERRY ROAD, MILWALL LONDON, E.

BEESON'S MANURE is the best for all Horticultural Purposes. Sold in tins, 1s., 2s. 6d., 5s., and 10s. 6d., or 1 cwt. bags, sealed, 13s. each. By all Nurseries and Seedsmen, or direct from the Works, 11 Mills, American Bight. Also good GRASS UNPOOLED BONES, any size, and guaranteed of the best quality.

PEAT and SAND.—Light Brown Peat for Nursery and Greenhouse Work, in four ton trucks of 10 yards, each at 10s. per yard. In bags, at 2s. 6d. per bag. Modelled on and American Plants, 15s. per ton. Orchard Peat 5s. per bag. Fresh SPHAGNUM, 10s. 6d. per bag. SILVER SAND, coarse or fine, 1s. per ton. WALKER AND CO., Farnborough, Hants.

MILDEW ON ROSES and other PLANTS, GREEN FLY, and RED SPIDER can all be exterminated by using Harris's specially prepared SILPHIDE POTASSIUM, of which enough to make thirty-two gallons of solution may be had post-free for One Shilling, from the Sole Manufacturers, PHILLIPS & CO., 25, Abchurch Lane, London, E.C. Also good GRASS UNPOOLED BONES, any size, and guaranteed of the best quality.

GISHURST COMPOUND, used by leading Gardeners since 1859 against Red Spider, Mildew, Thrips, Green Fly, and other Insects. 1 to 2 ounces to the gallon of soft water; 4 to 6 ounces as winter dressing for Vines and Orchard-house Trees; and in latter from the cask against American Blight. Has outlived many preparations intended to supersede it. Boxes, 1s., 3s., and 10s. 6d.

GISHURSTINE keeps Boots dry and soft on wet ground. Boxes, 6d. and 1s., from the Trade. Wholesale from PRICE'S PATENT CANDLE COMPANY (Limited), London.

Horticulture. If you wish for strong healthy plants producing rich colours and enduring blooms, use the

FLOWER-POTS from Eden Vale Pottery acknowledged to be the best and cheapest made. Sent for Price List to R. BUTCHER, Eden Vale Pottery, Westbury, Wilts.

FLAGSTONE EDGING for Kitchen Gardens, or Walks under Trees. Prices, 8d., 10d., and 12d. per yard. THE GREAT SLEAD QUARRY, Brighouse, Yorks.

Rosher's Garden Edging Tiles.

THE ABOVE and many other PATTERNS are made in materials of great durability. The plainest sorts are specially suited for KITCHEN GARDENS, as they harbour no Slugs or Insects, and take up little room, once put down, incur no further labour or expense, as do "grass" Edging, which costs very much cheaper.

GARDEN VASES, FOUNTAINS, &c. of Artificial Stone, very durable and of superior finish, and in great variety of design. F. ROSHER AND CO., Manufacturers, Upper Ground Street, Blackfriars, S.E. 1. Runcle Road, S.W.; Kingsland Road, E.

Agents for LOOKER'S PATENT "ACME" FRAMES, PLANT COVERS, and FRAGRANT BOXES also for FOXLEA'S PATENT BEADED GARDEN WALL BRICKS. Illustrated Price Lists Free by Post. The Trade supplied.

ORNAMENTAL PAVING TILES, for Conservatories, Halls, Corridors, Balconies, &c. from 3s. per square yard upwards. Pattern Sheet of Plain or more elaborate Design, with Prices, sent for selection. PLUMBING TILES, for Limes, Daisies, Ladies, Kitchen Ranges, Baths, &c. Grooved and other Striated Paving of great durability, Wall Copings, Drain Pipes and Tiles of all kinds. Roofing Tiles in great variety. Slates, Cement, &c. F. ROSHER AND CO., Brick and Tile Merchants. See Addresses above.

SILVER SAND, fine or coarse grain as desired. Price, by post, per Ton Truckload, on Wharf in London, 10s. 6d. direct from Pits to any Railway Station. Samples of Sand free by post. FLINTS and BRICK BURRS for Rokeries or Ferneries. KENT PEATS or LOAM supplied at lowest rates in any quantities. F. ROSHER AND CO.—Addresses see above. N.B.—Orders promptly executed by Rail or to Wharves. A liberal Discount to the Trade.

DAHLIAS

MISTAKES IN GARDENING.

AT the Bath Floral Fête, September 1, Mr. Shirley Hibberd, at the request of the Managing Committee, gave a brief address on "Mistakes in Gardening."

He said, in the few observations the title of his discourse suggested, he should not include a single word on any matter of taste. He would speak of what are commonly understood as practical matters, for although on the subject of taste he might know where to begin, he felt fully satisfied he should never know where to leave off. So, coming to practical matters, he would say that as in tailoring a man must cut his coat according to his cloth, so in gardening the best work was to be accomplished by making the best use of the materials at command. It was not to be questioned that the worst use was often made of the materials, and then gardening came to be described as a tiresome and costly process of obtaining a disappointment. Between what one would like and what is possible there was often a great gulf fixed, and one of the very first steps to success in gardening consisted in recognising the capacities of a place, and taking the fullest advantage of them. To enter into conflict with Nature is a serious business, and therefore it is a folly to speculate largely in the cultivation of subjects that are not adapted to the conditions at our command. It should be understood that it is not possible to grow to perfection on the same soil a great number of diverse genera of plants; a calcareous soil will not suit American plants; a hot, sandy soil will not suit show Roses; a heavy clay is a dreadful thing for alpenes, and to get Asparagus from it is not an easy matter. To a certain extent gardening is a conflict with Nature from first to last, and the fact may be adduced as an argument in favour of softening the outlines of the conflict by every possible opportunity. To alter the character of the staple soil was in many cases impossible; in others it was a slow, laborious, and costly business; therefore it was always best to begin by humouring Nature; selecting for the garden plants likely to thrive without any special aids or contrivances. A familiar example of the difficulty of modifying the original conditions was seen in plantations of Rhododendrons in places where soil and climate were alike unsuitable, the result being a rapid deterioration of the trees from the beauty they had when planted fresh from their beds of peat in a country nursery, to miserable scarecrows not good enough for the dressing of a Jack-in-the-Green on the First of May. If the making of a soil for a special purpose can ever be justified at all, the Rhododendron can offer as good a justification as any ornamental plants known to our gardens. But in truth, many such justifications may be found, and the man who can afford to gratify his whims may accomplish wonderful things verging on the impossible. But we see people who cannot afford to engage

in great conflicts making grievous and costly mistakes in doing certain things badly, when other things quite as well worth doing are as clearly at command as the present moment and the ground we stand upon. Many amateurs who love gardening attempt too much, and spread their energies over too large a surface; the result being imperfect work and superficial enjoyment. Substantial enjoyment and perfect satisfaction can only be hoped for as the result of doing things well, and with a view always, to use Greeley's words, to "beat the best record."

It is a key to sure success to measure first the range of capabilities, and, this being accomplished, it will be more creditable, and therefore more enjoyable, to make the best of these than to engage in conflicts and dally with difficulties. The resources of nature are so vast and various that wherever gardening is possible abundant entertainment and a reasonable range of profit may be secured by simply planting things that are the most likely to thrive, and leaving untouched, for a time at least, all doubtful subjects. There are sandy and loamy soils of such a kindly character that almost anything we plant will thrive upon them; but, generally speaking, every place has some peculiarities, and if unsuited for some things we should like may be admirably suited for some other things equally interesting and useful.

A common source of mistakes in gardening is the failure to forecast results. It is in picturing clearly the far-off effect of present work that the genius of the true landscape gardener is made evident. He sees the sapling tree as it comes to his hand for planting, and he at the same time sees it as it will be in twenty, thirty, or fifty years, and he sees his groups and combinations fully developed even at the moment of designing them, and thus it is that when he is dead and gone his work remains a living and a glorious monument. Now, many amateurs who love their gardens, and possess an immensity of knowledge of horticulture, fail in this necessary forecasting, and the beautiful pictures they make by means of costly planting develop into incongruities and absurdities, and the mistakes are declared when it is too late to remedy them. I will take you to a garden here and a garden there—for there are thousands of such as I have now in my mind's eye—and I will ask you if downright folly ever wore more beautiful features, or more plainly declared that the way the thing was done was the very way not to do it. Here we see Pines, Firs, Cedars, Spruces, and deciduous trees of many kinds, that when originally planted presented a most delightful stippling of many colours and sweet combinations of form, now jumbled in a confusion that confounds the planter, and compels one to groan aloud in a spoiled paradise, where sounds of joy only should be heard. How painful it is to see a lofty *Picea* or *Pinus* that has grown with vigour, and would have been a marvel of beauty under better circumstances, now eaten into by a forward *Spruce*, or threatened with extinction by an overtopping *Sequoia* that is itself hemmed in by a suffocating surrounding of *Deodars*, *Yews*, and *Cypresses*! This sort of mistake is repeated in every variety of form throughout the country, and is attributable in the first instance to deficient judgment of future effect; and in the next place to lack of courage in sacrificing many trees of secondary value in order to save the noblest, the rarest, and the most interesting.

And the mention of coniferous trees reminds me of the frequency of mistakes in planting them where they are not only unlikely to thrive, but certain to perish. We may see spacious approaches, that might have been noble if planted with deciduous trees, made hideous with *Conifers* that in their dinginess and distress seem lost in the cold calculation of the length of years allotted them. An impartial

looker-on might unhesitatingly condemn such as bad firewood, or take the tops for cheap Christmas trees, but the owners of such things appear always to be of a hopeful disposition, and expect the branches to return that Nature has removed for ever, not knowing that coniferous trees are of very limited elasticity, and do not renew their youth when decrepitude has come upon them, as often happens with deciduous trees. The *Deodar*, or the *Yew*, or the giant *Holly* that seals up all the windows of a house and makes pestilence in the family by excluding sunshine and air, we will not talk about, for it is not a mistake in gardening, it is an absurdity of a more dreadful nature, and belongs to the agencies—and there are many such—that blight the world and destroy life. These stiffers, however, illustrate in the most forcible manner the necessity of considering when we plant a tree what sort of thing it is likely to become in the course of a few years.

The needless conflict with Nature in which men often delight when they take to gardening is seen in the mismanagement of things. They plant fruit trees, perhaps, and if they would but leave them alone Nature would be kind and give them fruit. But they must do something, and so they pinch the trees several times in the summer, and prune them severely in the winter, and perhaps root prune occasionally when the trees have none too many roots, and the end of it is that get no fruit at all, or so little that its value will scarcely pay for the sharpening of the instruments of torture. The chopping, and shaving, and bleeding, and distorting of fruit trees to make them fruitful may be said to have had its day. Certainly I have seen some good result from my preachings on the subject ten years ago, and I expect to see much more yet, for the loudest advocates of the repressive system are beginning to believe in Nature a little, and they see that it is more profitable to allow the trees to produce fruit in their own way, than to ensure a crop by purchasing the fruit and tying it on. What is true of fruit trees is true of *Roses*, and many more good things that people insist on doing too much for, as though Nature had nothing to do with the production of flowers and fruits. One reason why standard *Roses* die in gardens is that they are too severely pruned, and the powerful *Brier* stock of which their stems consist must either be allowed to grow with vigour, or must give up an existence when it has become a mere oppression. If all the pruning knives and all the cutting and clipping machines that are used in gardens were completely abolished, Nature would assert herself in the free and bounteous growth of vegetation, and an abundant harvest of benefits for the sustenance and comfort and spiritual help of man; for as compared with any one tree that is pruned in a reasonable manner ten thousand are mangled into ugly barrenness, and their owners cry out that gardening is unprofitable. When Naaman was told to wash seven times he became an emblem of man in conflict with Nature. The simple course prescribed for his cure was too simple, for it meant that cleanliness is our best protection against disease. He "thought," he said, the prophet would engage in an elaborate performance to effect a cure, but the washing was a despicable proceeding—it was a too direct appeal to the renewing powers of Nature.

An illustration, both of the failure to forecast results and the tendency to attempt impossibilities, is seen in many gardens where the fruit trees overtop the walls. The essence of the case is that the walls are not tall enough for the trees, and the knife is freely used to effect a balance between them. For a time the balance is very poorly maintained by the cruel employment of coercion, the best growth the trees make being systematically shortened back to effect the accommodation. But this is for a

time only. If the trees thrive they will endeavour to assert themselves; in place of clean rods, rising direct towards the sky, they will throw up a thicket of spray along the top line of the wall, and look over to see if there is any help at hand. While this goes on, the growth on the top line being periodically harried by the gardener's knife, the trees will be found to bear less and less fruit, and to cast off occasionally the best-placed of their lower branches. There are many miles of respectable garden walls, or walls that might be respectable, in this plight, the consequence simply of injudicious planting, as though by the word of command a tall grenadier could roll himself up within a lady's reticule. It comes to nothing to say that walls cost money, because to make bad use of them for the butchery of trees that would be useful if reasonably treated is simply to waste the money expended, or at least to waste the opportunity for employing them usefully. Walls that are too short for *Plums* and *Pears* may be tall enough for *Nectarines* and *Morello Cherries*. Walls that are too short for these last may still be tall enough for *Gooseberries*, and *Currants*, and *Tomatos*. And walls that are too short for these last may pay their rent by sheltering early *Potatos*. Let us have proportion in gardening, and avoid complaining loudly of failures we have invited. The last man who should complain of having lost his head is he who willingly placed it in the lion's mouth.

The pivot on which we seem to turn in this kind of blundering is the notion that the knife is a remedial agent. Generally speaking it is an exasperating agent, making bad worse, thwarting rather than suppressing Nature, and effectual only in whitening away the foundations of our prosperity in gardening. Wall trees are of necessity systematically pruned, and more or less severely trained; and because of this all the natural growth that can be allowed consistently with the proper working out of the system should be not only allowed but encouraged. In a great garden, where the walls suffice for the needs of the trees, we see them, generally speaking, grandly developed, in the best of health, and wondrously fruitful. It is in the garden where false economy requires a short wall to do the work of one thrice the height that we find trees that grow too much at top and too little at bottom; and that not only produce little fruit, but are vexatiously prolific in the production of vermin.

Having mentioned vermin, I am reminded of the plagues of Egypt, all of them consequent on Pharaoh's hardness of heart. It often appears to me that Pharaoh has been fished out of the Red Sea, and galvanised into an amateur gardener, for this interesting gentleman governs the Land of Goshen much as Pharaoh did, with great ability and spirit; and yet he so often tempts Providence that the plagues follow and endeavour to consume him. He plants *Roses* and *Hollyhocks* amidst overshadowing trees, and in places so sheltered and snug that no unkind breath can reach them. The result is, that a garden intended for flowers becomes a sort of hotbed for mildew, and the sulphur merchant is applied to in aid of plants that are simply perishing for want of air. I am satisfied, by years of critical observation, that the plagues of our gardens are in a great measure the proper consequences of our practices; and we are convicted of inconsistency and inhospitality that we are so mean as to curse the guests whom we have taken pains to invite. Many of the casualties with which we have to reckon are beyond our control, and are true calamities, no doubt; but air and water are needed in vastly greater proportions by plants than our customary economy acknowledges, and sure I am that *Roses* and *Hollyhocks* have been and are very badly treated in respect of these primary necessities. The moulds and mildews and the insect enemies, in great measure, are

favoured by processes of starving and suffocating within doors and without, and if you will make a few comparisons between gardens that are clean and gardens that are dirty you will find that the differences chiefly consist in the proportions of air and water. You will say we cannot take our close town gardens into the breezy country, and to that I must respond in the affirmative. But I have added that the more unfavourable the circumstances the greater the need for forethought and for the observance of proportion. We see, in gardens of smallish dimensions all kinds of things doing badly on the boundary borders that would thrive joyously if planted in the very centre of the ground, to obtain a maximum of air and sunshine and a fair share of every falling shower. "We want the centre for our games," you say. Yes, but that does not necessitate crowding the borders with plants that can never prosper except in the fullest light and with all the heavenly breezes playing about them.

Mistakes in gardening will occur so long as the art is known to man, and the ablest gardeners will make mistakes, and will often learn from them more than they learn from their successes. But, for all that, successes are much to be desired, and if they do not bring material advantage they gratify the mind and confirm the wisdom of the adage, that what is worth doing is worth doing well.

AMATEUR BULB DEALERS.

IN our number for August 28, p. 279, a correspondent called attention to a method of doing business adopted by a dealer in a Midland town, and whose name was not given, and alluded to the practice of offering a discount of 10 per cent. to gardeners. This communication brought us a very courteous letter from a firm of lawyers at Birmingham, who, at the request of their client, Mr. Robert Sydenham, enclosed the subjoined communication from him.

We learn also from them that Mr. Sydenham is a gentleman of high repute, that anything he avers may be relied on, and that his firm is in a large way of business as wholesale jewellers and merchants, and occupies extensive premises built by themselves for the purpose of these businesses. This is Mr. Sydenham's letter:—

"AMATEUR BULB DEALERS.

"My attention has been called to an article in your issue of the 28th ultimo, headed as above and intitled 'D,' and which evidently refers to me, and is being freely commented upon by the local traders in bulbs, and is likely to do me and my firm serious injury unless the innuendos therein contained are publicly contradicted and withdrawn. If the writer wishes to know anything respecting me or the capacity and extent of my business premises, he can make inquiry, and he will find that I have more than ample premises to carry on two, three, or more businesses if I think fit to embark in them, and which I have a perfect right to do, notwithstanding any objection by others to the contrary. If you had read my circular, which I contend you ought to have done before you permitted the article in question to be inserted, you would have found, that I am not dealing in bulbs merely for 'private gain.'

"The allowance of 10 per cent. discount to 'Gardeners and large buyers' is no new feature in my dealings in bulbs. I deny that my prices are 20 per cent. in excess of other retail dealers in Dutch Bulbs. I have several lists of other houses before me, and on comparison find that my quoted prices are much lower than any of the retail traders, therefore, it is a gross libel upon me to say, that any gardener dealing with me 'must cause his employer to pay 20 per cent higher prices than he would be called upon to pay recognised dealers.'

"I must therefore call upon you, in your next issue, to retract and withdraw the objectionable and unwarrantable remarks you have made reflecting upon me and my character, and to apologise for having so made them, and to publish this letter.

"I am, Yours truly,

"ROBERT SYDENHAM.

"Birmingham, September 8, 1886."
 "P.S. I send you a copy of my circular of 1885, and also of this year. You will see I undertake, under certain circumstances to replace bulbs, which do not flower satisfactorily. This in itself would entitle me to charge a higher price if I thought fit, and having been in business here for fifteen years, my guarantee and undertaking is good enough for the public."

To this we add, though Mr. Sydenham does not ask us to do so, a copy of his printed circular for 1886, and a copy of a written document which was for-

warded to us by the correspondent to whose remarks Mr. Sydenham objects. For any possible error of fact in our correspondent "D,"s statement we must express our regret, but we may state our opinion that the practice of offering discount to gardeners is open to objection, and we may say that from trade-lists before us we find that some Dutch firms offer single bulbs of many varieties at considerably less price than Mr. Sydenham does for single bulbs of the same varieties.

"Tenby Street, Birmingham.

"Dear Sir,—In sending out this list of bulbs, I would have any unkind correspondents understand I am not a regular nurseryman, being a wholesale jeweller by trade, that I send out these bulbs more as a change from my ordinary business and to encourage amateurs to grow good bulbs, by supplying them with the best quality at prices which, by comparison, will be found considerably less than what is charged by the large nurserymen in this country or abroad.

"I have made bulbs my special study and hobby; this spring I spent a long time in Holland expressly to select those varieties which threw the best spikes of bloom, and have selected only those varieties which were universally the best bloomers. I found most yellow Hyacinths uncertain, the same with purples; those named in the list are the most reliable. I was surprised how very few good double Hyacinths I saw in Holland, and could only recommend the three named in list to those who will have double ones.

"Of the varieties mentioned in the enclosed list I have made special arrangements for a very large number of each, and obtained especially low figures as a large cash buyer. I can so far guarantee the quality of my best-named bulbs, that I will undertake to replace next year at half-price any which, with fair treatment, do not flower satisfactorily.

"For those who want cheaper bulbs I have purchased a second quality; they are what usually go to auction sales. With these, however, I can give no guarantee.

"I shall be pleased to obtain any varieties not mentioned in enclosed list at about a week's notice if ordered in any quantity.

"My friends will notice a large reduction in the prices of hundreds or other large quantities. These are sold in the original packages as they come from Holland, the smaller lots have to be carefully picked out, re-packed, labelled, hence extra cost for bags, labels, clerk's time, &c. I wish it, therefore, to be distinctly understood, I cannot sell less than the quantities named at the prices given, nor do I solicit any orders under 2s. 6d.

"I have made up three collections for those who like collections, particulars of which are on the last page. Purchasers may alter the collections in any way they suit their own taste, provided the value is kept the same.

"The bulbs may be personally inspected and selected any afternoons, Saturday excepted, after 2 P.M. I cannot undertake to attend personally to my bulb customers in the mornings, having other business to attend to, but all orders received by post, will select and execute with the same care as I would for my own planting.

"I advise all intending purchasers to order early, orders given late often prove unsatisfactory as the first buyers pick out the best.

"Having had a great deal of trouble to collect some money for bulbs sent in good faith to unknown customers last season, I must ask that the money be sent with the orders; I will give references when required, or return money if the bulbs are not perfectly satisfactory when received.

"Orders over £1 carriage paid in England; orders over £2 carriage paid to Scotland or Ireland.

"ROBERT SYDENHAM."
 "For cultural instructions, &c., I refer my friends to the short pamphlet sent with this list."

The following is a copy of a written document addressed to a well-known gardener and forwarded to us:—

"Sydenham Brothers,

"Merchants and Manufacturing Jewellers,

"Tenby Street, Birmingham.

"Sir,—Ten tons in weight of bulbs, as per enclosed list, to be here about the middle of the month (August).
 "Ten per cent., or 2s. in the pound, allowed to gardeners, and a special discount for large quantities.

"To Mr. —, Head Gardener."

— POTATOS. — According to the experiments made at Rothamsted, a summary of which is contained in the Memorandum Sheet for 1886, the yield of Potatos (Champions) in 1885, grown on unmanured land since 1876, amounted to 1 ton 1 cwt. per acre, the average of five seasons being 1 ton 19½ cwt. The heaviest crop (4 tons 9½ cwt.) was derived from the plot to which a rich manure, comprising ammonia, superphosphate, sulphate of potash, soda, and magesia, was applied. The average of five seasons on the same plot is 7 tons 13½ cwt.; so that there was a great deficiency. The plot to which nitrate of soda is added instead of ammonia, but otherwise the same, produced in 1885, and also on the average of five years, only a little less than the ammonia plot. The percentage of nitrogen in the tubers is also greatest in these highly manured plots.

THE HISTORY OF PLANTS.

(Concluded from p. 338.)

IN taking a further step into the past, and tracing the remains of existing species of plants preserved in the strata of the earth's crust, we must necessarily leave behind all certain chronology. Without an intelligent observer and recorder there can be no definite determination of time. We can only speculate as to the period required for effecting the changes represented by the various deposits.

The peat bogs are composed entirely of plant remains belonging to the floras existing in the regions where they occur. They are mainly surface accumulations still being formed and going back to an unknown antiquity. They are subsequent to the last changes in the surface of the country, and represent the physical conditions still prevailing.

The period of great cold during which arctic ice extended far into temperate regions was not favourable to vegetable life. But in some localities we have stratified clays with plant remains later than the Glacial Epoch, yet indicating that the great cold had not then entirely disappeared. In the lacustrine beds at Holderness is found a small Birch (*Betula nana*), now limited to Great Britain to some of the mountains of Scotland, but found in the arctic regions of the Old and New World and on alpine districts in Europe, and with it *Prunus padus*, *Quercus K. bur*, *Corylus Avellana*, *Alnus glutinosa*, and *Pinus sylvestris*. In the white clay beds at Bovey Tracey of the same age there occur the leaves of *Arctostaphylos Uva-Ursi*, three species of *Willow*—viz., *Salix cinerea*, *S. myrtilloides*, and *S. polaris*; and in addition to our alpine *Betula nana*, the more familiar *B. alba*. In beds of the same age in Sweden, Nathorst has found the leaves of *Dryas octopetala* and *Salix herbacea*, this being associated with *S. polaris*. Two of these plants have been lost to our flora from the change of climate that has taken place—viz., *Salix myrtilloides* and *S. polaris*; and *Betula nana* has retreated to the mountains of Scotland. Three others (*Dryas octopetala*, *Arctostaphylos Uva-Ursi*, and *Salix herbacea*) have withdrawn to the mountains of northern England, Wales, and Scotland, while the remainder are still found scattered over the country. Notwithstanding the diverse physical conditions to which these plants have been subjected, the remains preserved in these beds present no characters by which they can be distinguished from the living representatives of the species.

We meet with no further materials for careful comparison with existing species until we get beyond the great period of intense cold which immediately preceded the present order of things. The Glacial Epoch includes four periods during which the cold was intense, separated by intervals of somewhat higher temperature which are represented by the intervening sedimentary deposits. During these alternations of temperature extensive changes in the configuration of the land were taking place. The first great upheaval occurred in the early glacial period, and was followed by a considerable subsidence. A second upheaval took place late in the glacial epoch. Various estimates have been formed of the time required for this succession of climatic conditions and earth-movements. The moderate computation of Ramsay and Lyell gives to the boulder clay of the first glacial period an age of 250,000 years, estimating the time of the first upheaval as 200,000 years ago, while the subsidence took place 50,000 years later, and the second upheaval 92,000 years ago.

The sedimentary deposits later than the Pliocene strata, but older than the glacial drift, indicate an increasing severity in the climate, which reached its height in the first glacial period.

At Cromer, on the Norfolk coast, the newest of these deposits has supplied the remains of *Salix polaris*, *S. cinerea*, and *Hypnum turgescens*. This small group of plants is of great interest in connection with the history of existing species; their remains are preserved in such a manner as to permit the closest comparison with living plants. Such an examination shows that they differ from each other in no particular. In the post-glacial deposits in Sweden *Salix herbacea* is associated with *S. polaris*, as I have already stated. These two Willows are very closely related, having, indeed, been treated as the same species until Wahlenberg pointed out the characters which separated them when he established *Salix polaris* as a distinct species in 1812. One of the most obvious of the specific distinctions is the form and venation of

the leaf—a character which is, however, easily overlooked, but when once detected is found to be so constant that it enables one to distinguish without hesitation the one species from the other. The leaves of the two Willows in the Swedish bed present all the peculiarities which they possess at the present day, and the venation and form of the leaves of *S. polaris* from the pre-glacial beds of Cromer present no approach towards the peculiarities of its ally, *S. herbacea*, but exhibit them exactly as they appear in the living plant. This is the more noteworthy as the vegetative organs supply, as a rule, the least stable of the characters employed in the diagnosis of species. The single moss (*Hypnum turgescens*) is no longer included in the British flora, but is still found as an arctic and alpine species in Europe, and the pre-glacial specimens of this cellular plant differ in no respect from their living representatives.

The older beds containing the remains of existing species, which are found also at Cromer, have recently been explored with unremitting diligence and great success by Mr. Clement Reid, an officer of the Geological Survey of England. To him I am indebted for the opportunity of examining the specimens which he has found, and I have been able to assist him in some of his determinations, and to accept all of them. His collections contain sixty-one species of plants (enumerated by the lecturer) belonging to forty-six different genera, and of these forty-seven species have been identified. Slabs of clay-stone from the beach at Happisburgh contain leaves of Beech, Elm, Oak, and Willow. The materials, however, which have enabled Mr. Reid to record so large a number of species are the fruits or seeds which occur chiefly in mud or clay, or in the peat of the forest bed itself. The species consist mainly of water or marsh plants, and represent a somewhat colder temperature than we have in our own day, belonging, as they do, to the arctic facies of our existing flora. Only one species (*Trapa natans*) has disappeared from our islands; its fruits, which Mr. Reid found abundantly in one locality, agree with those of the plants found until recently in the lakes of Sweden.

The various physical conditions which necessarily affected these species in their frequent diffusion over large areas of the earth's surface in the course of say, 250,000 years, should have led to the production of many varieties, but the uniform testimony of the remains of this considerable pre-glacial flora, as far as the materials admit of a comparison, is that no appreciable change has taken place.

It is not my purpose to point out the bearing of these facts on any theoretical views entertained at the present day: I wish merely to place them before the members of this section as data which must be taken into account in constructing such theories, and as confirming the long established axiom that by us, at least, as workers, species must be dealt with as fixed quantities. From Mr. Carruthers's presidential address to the Biological Section, British Association.

New Garden Plants.

ARISTOLOCHIA RIDICULA, *N. E. Brown*, n. sp.

THE genus *Aristolochia* is well known for the curious and fantastic forms assumed by the flowers of the different species, but none that I have seen present (to my fancy at least) so remarkable an appearance as the flowers of this newly recently received from Mr. W. Ball of Chelsea; they are positively droll, the two lobes on the sides of the mouth of the flower forcibly reminding one of donkey's ears (see fig. 73).

This species is closely allied to *A. eriantha*, Mart., a species not yet in cultivation; the stems and leaves are almost identical, and the flowers are of the same type, but larger, and differ strikingly in the shape and position of the lobes at the mouth of the flower. In *A. eriantha* these are figured as somewhat spatulate at their tips, though they scarcely appear so in dried specimens, and spread out horizontally from the upper edge of the mouth of the flower, that is, the edge which is turned towards the stalk of the flower, the lower edge being truncate. In *A. ridicula* the lobes are not at all spatulate at the tips, and are directed upwards and backwards from the sides of the mouth of the flower, being placed near the lower edge of

the mouth, that is, near that edge of the mouth which is turned away from the stalk of the flower, and which is not truncate; the lobes are also longer, and covered with clavate hairs two-thirds of the way down, whilst in *A. eriantha* these hairs are quite confined to the tips; lastly the flowers and pedicels of *A. eriantha* are far more hairy and of a different colour.

The following is a description of the new species:—Stem climbing, terete, clothed with long horizontally spreading hairs; petioles $\frac{1}{2}$ to $\frac{2}{3}$ inches long, terete, clothed with spreading hairs like the stem; blade of the leaf 3–4 inches long, 4–5 inches broad, orbicular or orbicular-reniform, cordate at the base, very obtusely rounded at the apex, margin entire, bright (yellowish. Ed.) green above, paler beneath, covered with short rather stiff hairs on both surfaces, and having a rather disagreeable odour. Pedicels 2–3 inches long, and, as well as the outside of the flower, clothed with long spreading hairs, but not at all densely. The tube of the flower is from 3½–4½ inches in length, and is abruptly bent upon itself below the middle; the basal portion is much inflated, and ellipsoidal in form; the upper portion is curved inwards, a little compressed, and gradually widens towards the mouth; the colour of the tube outside is dirty-whitish, with reddish or purplish-brown veins, the basal inflated part being rather paler than the rest; inside it is whitish with the purple-brown veins showing through, and is covered throughout with white hairs. The limb is shortly revolute and entire on the upper half of the mouth, but on the sides of the lower half, that is, the part turned away from the pedicel of the flower, and which by the curvature of the tube in the position in which the flower hangs becomes the upper half, the limb is prolonged into two ascending and backwardly directed, linear-oblong obtuse lobes, with strongly revolute margins, diverging from each other at an obtuse angle. The entire limb is of a tawny colour, closely covered with dendritic dark brown-purple markings; on a cream-coloured ground; the lobes for about three-fourths of their length are sparsely covered with clavate dark purple-brown hairs. The gynoecium slightly clavate, and has six stigmas.

Introduced from Brazil by M. W. Bull. *N. E. Brown, Herbarium, Kew.*

CATLEYA (LABIATA) CROCATA, *Rhb. f.*

This curious plant appears to be very near the Eldorado group, though the fine white flowers are larger, and the lip is most distinctly four-lobed. A deep orange line runs from the base of the lip to its anterior disk, where it expands into a pentagonal blotch, with teeth in front. The column, white, with some green at the base, is nearly that of *C. Eldorado*. It might be compared to a small *Catleya Wagneri*.

This plant has come under my notice three times. First I had it from the late Wallis, who said it was one of the rarest Orchids he knew of. Then Mr. F. Sander sent me a dried flower, which he, alas! wanted me to send him back. Finally, I was exceedingly pleased to receive it from the collection of Mr. Edwin G. Wrigley, once my very diligent correspondent, from Howick House, Preston, Lancashire, in the very finest condition, and far better developed than the dried flowers I had seen before. It is, indeed, very like *Catleya E. Wallisii*, but this has sulphur-yellow arranged in another manner. I was once surprised by Mr. E. Wrigley with an inflorescence of *Phalænopsis Esmeralda*, boasting such a glorious colour as I had never seen before. *H. G. Rchb. f.* [It is necessary to say that this note was sent to Mr. Wrigley in April, 1883, but it has not been previously published. Ed.]

RHOPALA (SPEC).—Mr. Thiselton Dyer, the Director of the Botanic Gardens at Kew, remarks upon this tree as follows:—"The *Rhopala* is a small coniferous tree, growing to about 20 feet in height. It is remarkable for being absolutely indestructible by fire in large districts where the dry pastures and bushes are burnt twice a year. Its resistance to fire enables it to exist to the exclusion of all other trees and bushes as a perfect natural plantation. The periodical burning destroys everything except this tree. The resemblance to a plantation is moreover enhanced by the circumstance that the trees never form thickets, and they are thickly and almost systematically dispersed over the land. The tree delights in the most sterile soils, but always of a stony or shingly character. Sometimes it grows in places so barren that even grass cannot exist. This suggests the idea that it may be turned to account in sterile districts within the tropics."

Orchid Notes and Gleanings.

MILTONIA PEETERSIANA CONCOLOR, *nov. var.*

MR. W. BULL has been so very kind as to send me the whole inflorescence of the plant I alluded to in my report about that novelty (p. 326). It is remarkably distinct from the original inasmuch as the sepals and petals are not quite so dark. The lip, beautiful as it is, has not those dark eye blotches bordered with white margins. *H. G. Rchb. f.*

ODONTOGLOSSUM ASPERSUM.

A supposed hybrid between *O. maculatum* and *O. Rossi*. It is very free flowering, with lanceolate sepals, creamy-white blotched with brown, white petals, lip also white with a yellow callus, column purplish-rose. The plant does well near the glass in a cool house. *Orchid Album*, t. 245.

CATLEYA MOSSIE.

In the *Orchid Album*, at t. 246, is figured what is taken for the typical *C. Mossie*, some of the magnificent varieties will, we are promised, be figured later on. The most important points in their culture, says Mr. Williams, are to give the plants a good season of growth after their flowering is over, and when their growth is completed to give them a rest until they begin to show flowers, then they require a little help with moisture at the roots. They should not be allowed to get too dry during the resting period; the bulbs and leaves must be always kept plump and in vigorous health.

REICHENBACHIA.

The plants figured in the last part of this sumptuous periodical published by Messrs. Sander, of St. Albans, are—

Catleya Dowiana, var. *aurca*, t. 5.—*C. Dowiana*, the type, was discovered in 1850 by Warszewicz in Costa Rica, the variety *aurca* was found by Wallis in Antioquia, Columbia, a thousand miles to the south. Nevertheless the two are obviously forms of one species. *C. Dowiana* has a shorter and darker bulb than *C. Dowiana aurca* in which latter the flower segments are entirely yellow not splashed with crimson. Both forms should be grown in baskets half filled with drainage material. The soil should consist of fibrous peat and sphagnum mixed with charcoal and potsherds. They should be shaded from strong direct sunlight, and great care bestowed in watering, little being given in the resting period, August to February. They then begin to form new growths and require a few more degrees of heat and a moister atmosphere. From February to April the night temperature should range from 60° to 65° Fahrenheit. After April the growths will be maturing, and during the three following months thin shading will be necessary on bright days. Water should then be gradually withheld. The best time to pot or basket is January.

Coelogyne cristata maxima, t. 6.—The largest flowered variety of this lovely species, originally described by Lindley, and exhibited in 1841 for the first time at the rooms of the Horticultural Society in Regent Street. Other varieties mentioned are, viz. *Lemnoniana*, alias *citrina*, in which the lip is pale-yellow; *hololeuca*, pure white; *maxima*, the form here figured; and the *Chatsworth* variety and the *Trunham* variety differing from the type principally in size. The species is a native of Nepal and Sikkim, growing in a cool climate but fully exposed to the sun. Mr. Sander recommends that it should be grown in a cool-house except when in flower, when a higher temperature is desirable. Pots or pans (not baskets) are recommended for its culture, in order to secure sufficient moisture. When the bulbs become too crowded they should be thinned out. Potting should be done after the flowering season. Flowering season, December to March.

Odontoglossum Instansii splendens t. 7.—The variety is a native of the mountains of Western Mexico, the essential conditions for its culture being abundance of light and sunbeats, and a distinct resting period. It should be kept quite dry from the time it flowers in autumn, until May, and at a temperature ranging from 50° Fahr. to a maximum of 65° Fahr. In May the plant will begin to grow, when it should have abundant supplies of water and all the sunlight that

can be given, so much so, that during summer no shading is required. It may be grown either in pots or baskets.

Laelia Eustatha, t. 8. — In growth the plant resembles *L. purpurata*, but the form of the flower is more like that of *L. elegans*, while in colour it differs from both. It should be grown, says Mr. Sander, under the same conditions as *L. purpurata*. Pot culture suits it best, and the plant must be potted high, the pot being nearly filled with crocks and charcoal. It should never be allowed to become dry, but requires most water in the growing period, abun-

placed the pots containing the plants near the glass in a low span-roofed house; the temperature is rather lower than the Cattleya-house, but higher than is usually given to cool Orchids. The plants are rooting well over the rims of the pots, and are throwing up strong flower-spikes. There are now so many Mexican Orchids requiring similar treatment to these *Barkerias* that it would be easy to fill a good-sized house with interesting and showy species and varieties, such as *Laelia anceps*, *L. autumnalis*, *L. majalis*, *L. purpurata*, &c. They scarcely require any shade, but demand plenty of light and heat by day, with a quite cool night temperature. The lovely *Barkeria*

tinct species. Mr. Sander told me that the habitat of *L. elegans* has been well searched, and nearly all the large specimens have been sent over. Certainly never were such large specimens seen in England as there are now in various nurseries and private gardens. J. D.

CULTURAL BOTANY.

[THE following observations by Professor Bessey were addressed to agriculturists, but they apply even more forcibly to gardening. ED.]—

Permit me now to discuss directly the question, "What are the demands made by agriculture upon the science of botany?"

NOMENCLATURE AND CLASSIFICATION.

It demands of it a nomenclature and a classification of the plants of the farm, including not only the cultivated plants, but all those which, in one way or another, are of interest to the cultivator. I say it demands such a nomenclature and classification, but how far is this demand honoured? How much does ordinary botany do in furnishing nomenclature and classification for Wheat, Oats, and Indian Corn; for Apples, Peas, Peaches, and Cherries; for our Roses, Geraniums, and Verbenas,—in fact, for all the plants which have run into many varieties? What the student learns as to a specimen of Wheat, for example, is that its name is *Triticum vulgare*, and that it is a member of the order Gramineæ. In the proper botany of the schools there is absolutely nothing further furnished as to nomenclature, and little more as to classification. It is the same with Indian Corn. The student may have in hand Pop-corn, Sweet-corn, Flint-corn, Dent-corn, and even Husk-corn, and yet the science of botany gives him but one name—each one is ticketed "*Zea* mays, of the order Gramineæ." So it is with every other cultivated plant.

Now, I ask, is this an adequate nomenclature? Is it, in fact, worth our while to study botany if this is all it can do for agriculture? I put my query in this form because some people still hold that the supplying of a nomenclature and classification is the great purpose of botanical study in so far as it is related to agriculture.

I hold that it is the duty of the botanists to furnish a classification and a nomenclature to agriculture, and I look with great interest upon the efforts which have been made by botanists here and there to classify and name the varieties of some of the cultivated plants. The attempt by Professor Beal to classify the Apples by taking into account the floral characters, and the later attempt by Dr. Sturtevant to work out a classification of Indian Corn, are efforts in the right direction. It is said by some that the consideration of cultivated plants lies outside of the domain of botany. But, if botany is the science of plants, how can a plant ever, by any amount of variation, pass beyond its domain? Who shall say that science must stop at this or that line? Can the mere accident of modification through cultivation take a plant out of the botanist's jurisdiction, when modification through what we term natural agencies does not? All plants, in all states and under all conditions, should legitimately be included within the domain of botany.

VEGETABLE PHYSIOLOGY.

Agriculture demands of botany a knowledge of the physiology of the plants of the farm. It demands, first of all, that science shall throw light upon the processes of growth and nutrition. Every question concerned with the taking of food by the plant, the method of using it, its effect upon the stem, leaf, and fruit, must be answered by botany, if it is to command the respect of the practical men of the agricultural world. A great part of the success of the agriculturist is dependent upon the perfect growth and nutrition of the plants he cultivates. And his success is greater the more closely he is enabled to bring about and maintain those conditions which are most favourable to such growth and nutrition. But how can he intelligently work for these conditions if he does not know them? And how can he know them if the very science which professes to include the study of all plants can give him no aid?

Any presentation of botany which leaves out a full discussion of the growth and nutrition of plants, in so far as it fails of being useful to the agriculturist.

FIG. 73.—ARISTOLOCHIA RIDICULA. FLOWERS CREAM-COLOURED, WITH DULL PURPLISH-BROWN RETICULATION. (SEE P. 360.)

dance of light and a temperature which should not fall below 60° Fahr.

The plates in this number are of even superior artistic merit to those in the former part, the botanical details, including the woodcut analyses of the flower, are by Prof. Reichenbach, while the cultural directions emanate from Mr. Sander. This statement is alone sufficient to guarantee the value of this superb publication.

BARKERIA ELEGANS.

In the garden of Walter Cobb, Esq., Silverdale Lodge, Sydenham, this handsome species is making most vigorous development, and promises a fine display about Christmastide. Mr. Catt seems to have hit upon the right treatment for them; he has

spectabills is seldom seen in such great beauty as it used to be some thirty years ago. We now know the treatment these plants require, and when they receive it we do not find any difficulty in keeping them up to the flowering point.

The true *Laelia elegans* alba is also flowering freely in Mr. Cobb's garden; it is a lovely variety of the species which should be grown in every collection. The recent large importations of *Laelia elegans* have produced some very fine varieties, and amongst them a good sprinkling of the variety alba. The sepals and petals are of the purest white, lip rich crimson-purple. The true *L. elegans* Wolstenholmie and the variety *Turneri* are scarce. I am not aware that either of these have been recently imported. Mr. Williams, in his *Orchid Grower's Manual*, describes six forms besides the normal species, but makes *Turneri* a dis-

Then there is the whole subject of reproduction, which is of great importance and value to the agriculturist in these days when our agricultural literature is filled with discussions upon fertilisation, cross-breeding, heredity, &c. Botany must present these topics with as much of clearness as possible. Every full course of study in botany should include a particular discussion of the mechanism of fertilisation in its widest sense. Modern agriculture demands satisfactory answers to the questions,—How are the cultivated plants naturally fertilised? How can their fertilisation be controlled? How can cross-fertilisation be effected? What are the laws of hybridisation? In how many instances can the teacher of botany give a reply to these queries? I fear that the agriculturist in quest of knowledge upon these botanical points will have to turn sadly away from most of the lecture-rooms and botanically laboratories of our colleges.

So, too, the discussion of everything pertaining to the germination of seeds falls properly within the domain of botany. There are few things more important than that of germination; but, excepting a short and summary discussion—and with a very general one—but little attention is given to the subject in ordinary courses of study in colleges.

Last under this head I would call attention to the need of a study and discussion of the physiology of the cultivation and improvement of plants. What is it that takes place in the structure of a plant when we bring it under cultivation? What are the differences between a wild plant and the same plant under domestication? How do the changes due to cultivation arise? What laws control these changes? Is there a limit to these changes? These are a few of the questions which agriculture is asking of botany, but which, alas! are not as yet satisfactorily answered.

VEGETABLE PATHOLOGY.

In the third place, agriculture demands of botany a knowledge of the pathology of vegetation. It is not enough that the normal action of all parts of the plant should be understood; the abnormal and diseased actions must also be considered. Unfortunately the world is full of accidents, of noxious gases, of poisonous liquids, of freezing or scorching temperatures, of baneful insects, and of destructive fungi. The plant which is more or less affected by one or all of these is not the normal plant of the vegetable physiologist. The vegetable pathologist must build his science upon that of his fellow-worker in vegetable physiology, and the results of the labour of both must be laid before modern agriculture for its use. That botany which hopes to satisfy the demands of the advanced agriculturist of to-day must include a knowledge of pathology. *Charles E. Bessey, in the "Proceedings of the Society for the Promotion of Agricultural Science."*

COLONIAL NOTES.

AN AUSTRALIAN BEAUTY SPOT.

LIKE MR. G. A. Sala and other visitors to the metropolis of New South Wales, Dr. Taylor, Editor of *Science Gossip*, seems to have become quite enamoured of the Sydney Botanical Gardens, so long under the direction of Mr. Charles Moore, the brother of the late Dr. Moore, of Glinshin. He says—"There are many trees of special note growing in the grounds, the principal of which, perhaps is a magnificent Norfolk Island Pine (*Arcaurica excelsa*)—a tree very abundant in the larger gardens and shrubberies of nearly all Australian towns. There are also fine specimens of the well-known Australian Proteaceous plant, *Grevillea robusta*—perhaps the largest and most attractive of this singular order. Myrtus, with their broad and showy foliage, the Maiden-hair-leaved *Distichia* from Japan (*C. confertifera* tree, which has been in existence ever since the carboniferous period), the singular Mauritian Palm, the Bloodwood of Norfolk Island (*Bilqia lucida*), the Orange-Orange of America (*Maclura aurantiaca*), the Mottown Bay Chestnut (*Castanospermum australe*), with its deep green foliage and bright scarlet flowers, the Tall-woods of Eastern Australia (*Luphelia pendula*), the *Randia microphylla* from Lord Howe Island, besides Bananas, Bamboos, multitudes of species of Palms, New Zealand, Cabbage-trees, Dombeyes, Pterocarpums, Nepheliums from China, *Eleocarpus* from India, *Brexiaria* from Madagascar, *Lactaria* from the Queensland bush, sacred and other *Faguses* from India, *Sciadophyllum* from New Guinea, *Hydrocotylon* from Norfolk Island, *Cycads* and *Zamia*, *Scheuchzia* from the Cape, a vast number of species of Pines, *Erythrina*, from the West Indies (just bursting into their singular

scarlet blossom), and many others too numerous but not too unimportant to mention unless in a botanical inventory—make up the diversified and wonderfully combined arboreal foliage with which the diversified surface of these beautiful gardens is clothed. Floral parterres and patches are gay with flowers, whose manifold colours offer a rich feast to the eye. The rocks and rocky places are covered with the grotesque forms of *Cactuses* and *Aloes*. Climbing plants from all parts of the world have been trained to clamber up and festoon trees and shrubs of a less conspicuous character. All that botanical and horticultural art and skill can do, combined with perhaps the most picturesque situation in the world and a most delightful climate, have made the Sydney gardens a place worth coming to the antipodes to see."

HEDGES, USEFUL AND ORNAMENTAL.

MANY species of plants have from time to time been recommended for the purpose of forming hedges, and some species have been mentioned which will hardly be found to be suitable for the object in view, such as the Hazel, the Willow, and even the common Elder—all rapidly growing plants it is true, but not adapted to the purpose. Really suitable plants for this purpose, although not numerous, are yet sufficiently so to furnish a choice of material. Hedges may be divided into two sections, viz., the really useful hedge or fence, which will act as a protection to fields or enclosures against the inroads of stock of all kinds, and also the least likely to be injured by ground game, while ornamental hedges or screens may be formed of various species, chiefly evergreen, which may not possess the strength required in a field hedge.

THE QUICK.

For a really useful fence the Whitethorn must be admitted to be the most widely distributed and universally adopted plant for this purpose, and is far from being destitute of beauty; taken altogether, there is possibly only one species which can be recommended in preference to it, and that is the common Holly. But as regards the Whitethorn (*Crataegus oxyacantha*) it very speedily forms an effective fence, and is a plant which readily submits to harsh treatment; indeed, the usual method of planting the Whitethorn in the form of a hedge is certainly open to considerable objections, viz., the chopping off the tops of the plants and the planting of the roots upon the side of a dry sloping bank, formed by the throwing out of a ditch or dike, in front of the hedge about to be planted.

The throwing up of the excavated soil, however, is an advantage rather than otherwise, as tending to give increased depth of soil; and the formation of a ditch acts to some extent as a protection to the young plants, on one side at least. But instead of planting the denuded roots of the "Quicks," as they are termed, on the sloping face of the bank they should in their entirety be planted on the levelled surface of the soil, deferring the heaving down of the plants until the spring of the second season. Where this plan is followed an efficient fence will generally be secured in a much shorter time than will be the case when the operation of planting as first described is practised. But whatever method of planting is followed protection against game and stock should be given for the first two or three years, after that the plants will usually not require it.

THE HOLLY.

The plant next in importance as a hedge plant is the common Holly, and it may hardly be justifiable to place this plant as second to the Whitethorn, which possesses only one advantage over the Holly, viz., that of being cheaper. But in many respects the Holly surpasses the Whitethorn as a hedge plant. It has the advantage of being evergreen. And if healthy plants of fair dimension are used for the purpose, say, not less than 3 feet high, the Holly will form a fence quite as soon as the Whitethorn, and will be equally effective and enduring. It also affords an admirable shelter to stock in winter, or at a time when the Whitethorn falls to do so, and were Holly hedges to some extent substituted for those of the Whitethorn, the aspect of the landscape would without doubt be improved, more particularly during winter, and at all seasons a well-formed Holly hedge is an object of great beauty.

Hedges, whether composed of the Holly or the Whitethorn, or other species of plant, are often in-

jured by forest trees being planted in them, and which, as soon as they attain to considerable dimensions, render a portion of the hedge on each side of them weak and ineffective, while the shade thrown by the crown, as well as the action of their roots, tend to injure the crops in their vicinity, so that it is quite possible that the practice of planting large growing trees in hedgerows might with advantage be discontinued, at least on arable land. The advocates of this practice argue that such trees, in the course of time become valuable as timber, and grow into money; on the other hand, it may be questioned if this value is not more than covered by the injury they have inflicted during many years upon corn and other crops. A writer in a contemporary recommended the planting of Pear trees in hedgerows, but the value of fruit in this country is not now such as to warrant the employment of the Pear as a hedgerow tree, and for various obvious reasons this recommendation is unlikely to be extensively followed.

It has been said that hedgerow trees tend to give beauty and effect to the landscape; but it may be doubted, if trees, however ornamental they may be, when necessarily planted in stiff and straight lines, add greatly to the beauty of the landscape; while this desideratum, as well as the desired shelter to stock, might be better secured by the planting of a few suitable trees in clumps in the corners, or at the junction of three or four fields, as well as in the case of large enclosures in groups or clumps in suitable situations, so as to secure shelter, as well as with the view of producing desired effects—effects in the landscape.

SCOTCH PINE AND SPRUCE.

In some parts of the Eastern Counties of England, where the soil is of an exceedingly light character, it is found that the Whitethorn can hardly be induced to form a fence, and in many instances the common Scotch Fir (*Pinus sylvestris*) has been largely used for this purpose, and is found to answer the purpose tolerably well for a time, when it mostly loses its lower branches, and becomes unserviceable as a fence; while the common Spruce, where it has been tried, is found to succeed very much better than the Scotch Fir; it submits better to the operation of clipping or trimming; in fact, this operation appears to assist the plants in retaining their lower branches and foliage, and forms a by no means despicable evergreen fence.

BEECH.

The common Beech (*Fagus sylvatica*) forms also an excellent fence; the plants when grown in this form have the valuable property of retaining their withered leaves throughout the winter and early spring, or until they are displaced by the new, so that a high Beech hedge—and this may be grown to any desired height—is of very great value as a shelter during winter to comparatively tender plants, as well as to live stock in the fields, but is not taken advantage of for the latter purpose so frequently as might be the case. The young wood of the Beech is liable during the summer to the attacks of a species of aphid peculiar to it, and this is a very great drawback to its merits as a hedge plant. It is said, however, that the purple-leaved variety, viz., *Fagus sylvatica atro rubens*, is found to be exempt from this pest, and if so, this renders the purple variety still more valuable as an ornamental plant for hedges, or as a standard tree.

THE FUZZE.

The common Fuzzle, although indigenous to Great Britain, is nevertheless far from being hardy, and is not infrequently killed to the surface of the earth in severe winters. In some parts of the South of England, particularly when near to the sea, this rarely takes place, and the Whin forms an excellent and enduring evergreen fence which can be cut with impunity into any desired form.

As has already been said, the Holly proves an inestimable plant in the formation of hedges intended to resist farming stock of all kinds, as well as to afford shelter to the same during inclement weather. It also forms a most ornamental hedge, or screen, to separate or to conceal certain portions of pleasure grounds, &c., from others where this may be desirable. It also submits without injury to clipping, and may be trained into any desired form, and be kept as a dwarf hedge, or can be made to grow, in a comparatively short time, to any desired height; but in cutting or trimming a Holly hedge it is better to use

the knife than the hedge-shears, as the latter implement mutilates the leaves, and for a time disfigures the hedge.

THE YEW.

The common Yew is the plant most generally used for the purpose of forming ornamental hedges in gardens and pleasure grounds, and no more suitable plant for this purpose can possibly be found; it may be cut into any desired form, and seldom loses its lower branches, or becomes thin at the bottom, as is the case with some species of plants when forming hedges. Its development cannot be said to be very rapid, but when a Yew hedge is established it may almost be said to be everlasting, and its rich dark shade of green distinguishes it from all other species of plants, and renders it exceedingly suitable for the purpose; it is so generally used. Among seedlings of this plant considerable diversity will frequently be found in their habit of growth. Some plants will be found to be of spreading habit, while others will be found more or less fastigiated, or approaching the habit of the Irish variety, *Taxus fastigiata*; hence in selecting plants for the formation of a hedge it is desirable that they should to some extent be uniform in their growth or habit, so that spreading as well as fastigiated plants should be rejected. The Yew in all its varieties being a deadly poison to stock it should never be planted where such are likely to gain access to it.

ARBOR VITÆ.

Many varieties of the Arbor-vitæ are found to form exceedingly beautiful hedges or screens, hardly inferior to the Yew, although of a lighter shade of colour, which may in some instances be desirable rather than otherwise, while such plants have generally the advantage of more rapid development. Among this family of plants possibly none are better adapted to the purpose than *Thuia Lobbiæ* and *T. plicata Warreana* var., which soon form exceedingly beautiful hedges, which can be cut or clipped into any form with impunity. *Thuia occidentalis* and *Thunopsis borealis* need not be despised as hedge plants.

LAURELS.

The common Laurel (*Cerasus Lauro Cerasus*) is a native of the Levant, and somewhat tender, and although frequently used for the purpose of forming hedges, can hardly be recommended, as it seldom escapes serious injury during severe winters. The Portugal Laurel is more hardy, and altogether better suited to the purpose of forming ornamental hedges.

BOX, SWEET BRIER, &c.

The Tree Box (*Buxus arborescens*), as is well known, forms very pretty hedges, as does also several distinct species or varieties of the Box, such as *B. rotundifolia*, &c. The Sweet Brier (*Rosa rubiginosa*) forms a very pretty dwarf hedge, which, on account of its perfume, is generally appreciated; and there are also many of our hybrid perpetual and other Roses which form very attractive hedges. The common Privet (*Ligustrum vulgare*) and *L. ovalifolium* very quickly form neat and pretty hedges, more particularly the latter, on account of its finer foliage; while as a hedge plant in close proximity to the sea, which is unfavourable to the development of most species, the Tamarix gallica and *T. germanica* are well suited for this purpose; both species are exceedingly beautiful. For the purpose of producing an immediate effect, or to conceal an unsightly object, plants of the Lombardy Poplar (*Populus fastigiata*) arranged in the form of a hedge will speedily effect the desired object, until the same can be accomplished by an evergreen or other more permanent fence, but which requires a longer time to attain to the necessary dimensions.

Hedges may, of course, be trained into various forms, but possibly the best form for a Whitehorn hedge is that of the hog's mane, that is, wide at the bottom, tapering towards the top. Hedges in gardens and pleasure grounds will generally present the most ornamental aspect when formed in what may be called the perpendicular style, or in the form of a wall, but in no instance should hedges be allowed to become wider at the top than at the bottom, as this invariably tends to weaken the lower portion of the hedge, which it is so desirable to maintain in a robust and healthy condition. Early autumn is without doubt the best season in which to clip or trim hedges; if this cannot then be accomplished, it should be deferred until spring, but on no account should an evergreen hedge be cut during winter.

Nothing has as yet been said respecting soil, but as regards all the plants which have been named as suitable for the formation of hedges, it may be said that they will succeed in any tolerably good soil, and as a rule it may even be said the better the soil the more satisfactory will be the progress of the plants. But where the natural soil is decidedly poor, it will

in all cases be advisable to enrich it by the addition of suitable compost, or even well decomposed manure. P. G.

FRUIT NOTES.

AMERICAN PEACHES.

My experience of Alexander from the inspection of a goodly number of gardens, agrees with Mr. Douglas's, namely, that it is perfectly amenable to early forcing. Exquisite Mr. Douglas cites as a variety needing artificial fertilisation; this also corresponds with my experience; for, together with Raymaker's and Prince of Wales, the blossoms need careful going over with a fine brush, or else the yield will be very scanty. The current year seems to be a very good one for Peaches out-of-doors. The following are perhaps the hardiest varieties—Waterloo, Hale's Early, Early Ascut, Marquis of Downshire, Dymond, Stirling Castle, Burlington, Sea Eagle, Teton de Venus, Frogmore Golden, Desse Tardive, Wallburton Admirable. *Vagabond*.

PEACH CONDOR.

I find this a most useful variety to follow up Hale's Early in the early Peach-house, as it fills up a blank between that variety and the Royal George. I have grown it several years, and therefore can speak highly of its good qualities for forcing and as a free setter. The fruit is of large size, bright crimson, and of a piquant and rich flavour. *Edward Ward, Hensall Gardens, Bromsgrove.*

PEACHES ALEXANDER AND AMSDEN JUNE.

Mr. Douglas's experience with these varieties tempts me to ask if he will kindly state the difference between them. I have young trees planted on a wall that have fruited for the past two seasons, and I fail to see much difference. That other American novelty, the Waterloo, ripens a few days earlier, is larger, and equal in colour and flavour. Alexander and Amsden I have no experience with indoors, but a young tree of Waterloo planted in our second early house twelve months ago last November has this season borne a crop of eighty-seven handsome fruits much larger than I expected. The tree has made exceptionally good wood, so that I have every reason to expect an excellent crop next year. *H. Markham, Mercersburgh Castle.*

HINTS ON ORCHID CULTURE.

AN interesting paper on this subject was read lately by Mr. Wm. Swan, of Howick, Preston, at a meeting held under the auspices of the Preston and Fulwood Horticultural Society.

Mr. Swan, in introducing the subject, alluded to Orchids being a class of plants that invariably give pleasure to all who had the privilege of gazing upon them when gay with rich and showy blossom; after which he said that it was no wonder there was a desire for fuller and more extended acquaintance with such a lovely race of plants. The strange forms, the singular method of growth, the gorgeous and attractive flowers, the sweet and fragrant odour of so many of the species, all combined to make the study of Orchidaceous plants a charming and fascinating pursuit. Proceeding, he dwelt upon their culture being formerly confined to a few wealthy patrons, whilst today, through the enterprise of leading nurserymen, those with limited means were able to purchase and cultivate them; named the high prices that had been given for some varieties, and spoke of the foreign lands in which they had been found, and whence they had been imported.

ORCHID HOUSES.

In noticing the class of houses in which the plants should be grown he admitted that fine specimens had been grown for years in lean-to houses or half-spans, and that good plants had come from Pine pits; but for all practical purposes, whether East Indian plants, Dendrobiums, Cattleyas, or Odontoglossums, there was nothing in his judgment to compare with low span-roofed houses.

Perhaps in some situations a north house might be preferred for the Odontoglossums; but in that district the amount of sunlight a house so situated received during November, December, January, and February, when the plants were making growth, was so small that the benefit derived was lost owing to the reduced sunshine and lowered temperature during summer. The dimensions of the house would necessarily be

regulated by the number of plants intended to be grown. As a commencement, a house 50 feet long by 18 feet wide, 10 feet high in the centre, with a middle stage 6 feet wide, side tables 3 feet wide surrounding it, with walks, with a glass division in the centre, would be found convenient for such things as Vandas, Aerides, Phalenopsis, Dendrobiums, &c., in one portion, and Cattleyas, Laelias, Cologynes, Epidendrums, many of the Oncidiums, and others requiring a lower temperature, in the other. A span-roof house 30 feet long, 10 feet wide, 7 feet high to the ridge, with side tables 3 feet 6 inches wide, and a path up the middle, would be very serviceable for such cool species as Odontoglossum Alexanderæ, O. Pescatorei, O. triumphans Hallii, Oncidium serotinum, O. macranthum, O. J. nulum, most of the Masdevallias and Restrepias, as well as the beautiful Dendrobium Jamesianum and Disa grandiflora. The stages should not be open lattice wood work, for plants standing upon such stages were directly over the hot-water pipes, and so when fireheat was necessary the air about the plants was of a dry and ungenial nature, injurious to the plants so far as growth was concerned. These conditions were also most congenial to the development of insect life. He advocated that stages be covered with plain roofing slates, with an edging along the front and back about 2 inches high, upon which should be spread about 1½ inch of cinder, sifted or washed, so that all the fine dust was separated, or ordinary furnace coke broken small. The latter was excellent, as it held considerable moisture when watered, and took a long time to become covered with green mossy conifers that was so unpleasant to see in their heated structures. It also formed a better under-surface to the plants than the dazzling white spar so often used. He considered the spar very objectionable in stoves; it retained little water, and plants always presented a more sickly hue when on a white ground than one of a darker colour. Again, no white soil was ever met with, hence it was against natural conditions and the well-being of the plants. In fixing the side stages a space of 2 inches should be allowed between the back and the inside of the wall, so as to leave room for the free circulation of the air, and to permit the heat from the pipes to be distributed more equally over all the house. There should always be sufficient hot water pipes in the houses to keep the divisions at the desired temperatures without severely driving the fires, and they should be 6 inches at least from the floor. The heat would ascend more rapidly because of a free circulation of air about the pipes, and the moisture under the stages would not dry up so quickly as when the pipes were very low. It was wise to have roller-blinds fixed on the top ridge if the ventilators would permit, or if not then just below the opening lights. This tiffany or light open material should be used, the object in shading being not to exclude sunlight, but reduce the intensity of its rays. They must occasionally shade their plants or they would have to mourn over scalded leaves, which disfigure the plants for months, and in some instances a longer period. By fastening strips of wood 3 or 4 inches wide, at about every third light for the blinds to run on, the shading was just above the glass. This allowed a current of air to be always moving between the blind and roof, which tended to keep the houses cool, and prevented the air getting so dry as it otherwise would do. He deprecated the constant use of blinds, it being surprising how much sun-shine would benefit the majority of plants.

The quantity of water they should give and the degree of humidity they should strive to attain, were details to be left very much to the judgment and discretion of the operator, who should be guided by the class of house with which he had to deal. It should be remembered that when the plants were in active growth a good share of water was needed for each. Where the house was devoted to Orchids alone, good dampings down were necessary twice, and in very hot weather three during the day. The plants when growing needed water often, but the surroundings should be kept damp and moistened rather than that the soil should be wet and soddened.

POTTING.

Potting required care and forethought. The pots and crocks should be clean. In crocking, the pieces should be placed as upright as possible, leaving open spaces for the quicker passing of the water, as well as for the entrance of fresh air to the roots. Some well-burnt charcoal might be safely used among the crocks, and

regulated by the number of plants intended to be grown. As a commencement, a house 50 feet long by 18 feet wide, 10 feet high in the centre, with a middle stage 6 feet wide, side tables 3 feet wide surrounding it, with walks, with a glass division in the centre, would be found convenient for such things as Vandas, Aerides, Phalenopsis, Dendrobiums, &c., in one portion, and Cattleyas, Laelias, Cologynes, Epidendrums, many of the Oncidiums, and others requiring a lower temperature, in the other. A span-roof house 30 feet long, 10 feet wide, 7 feet high to the ridge, with side tables 3 feet 6 inches wide, and a path up the middle, would be very serviceable for such cool species as Odontoglossum Alexanderæ, O. Pescatorei, O. triumphans Hallii, Oncidium serotinum, O. macranthum, O. J. nulum, most of the Masdevallias and Restrepias, as well as the beautiful Dendrobium Jamesianum and Disa grandiflora. The stages should not be open lattice wood work, for plants standing upon such stages were directly over the hot-water pipes, and so when fireheat was necessary the air about the plants was of a dry and ungenial nature, injurious to the plants so far as growth was concerned. These conditions were also most congenial to the development of insect life. He advocated that stages be covered with plain roofing slates, with an edging along the front and back about 2 inches high, upon which should be spread about 1½ inch of cinder, sifted or washed, so that all the fine dust was separated, or ordinary furnace coke broken small. The latter was excellent, as it held considerable moisture when watered, and took a long time to become covered with green mossy conifers that was so unpleasant to see in their heated structures. It also formed a better under-surface to the plants than the dazzling white spar so often used. He considered the spar very objectionable in stoves; it retained little water, and plants always presented a more sickly hue when on a white ground than one of a darker colour. Again, no white soil was ever met with, hence it was against natural conditions and the well-being of the plants. In fixing the side stages a space of 2 inches should be allowed between the back and the inside of the wall, so as to leave room for the free circulation of the air, and to permit the heat from the pipes to be distributed more equally over all the house. There should always be sufficient hot water pipes in the houses to keep the divisions at the desired temperatures without severely driving the fires, and they should be 6 inches at least from the floor. The heat would ascend more rapidly because of a free circulation of air about the pipes, and the moisture under the stages would not dry up so quickly as when the pipes were very low. It was wise to have roller-blinds fixed on the top ridge if the ventilators would permit, or if not then just below the opening lights. This tiffany or light open material should be used, the object in shading being not to exclude sunlight, but reduce the intensity of its rays. They must occasionally shade their plants or they would have to mourn over scalded leaves, which disfigure the plants for months, and in some instances a longer period. By fastening strips of wood 3 or 4 inches wide, at about every third light for the blinds to run on, the shading was just above the glass. This allowed a current of air to be always moving between the blind and roof, which tended to keep the houses cool, and prevented the air getting so dry as it otherwise would do. He deprecated the constant use of blinds, it being surprising how much sun-shine would benefit the majority of plants.

The quantity of water they should give and the degree of humidity they should strive to attain, were details to be left very much to the judgment and discretion of the operator, who should be guided by the class of house with which he had to deal. It should be remembered that when the plants were in active growth a good share of water was needed for each. Where the house was devoted to Orchids alone, good dampings down were necessary twice, and in very hot weather three during the day. The plants when growing needed water often, but the surroundings should be kept damp and moistened rather than that the soil should be wet and soddened.

POTTING.

Potting required care and forethought. The pots and crocks should be clean. In crocking, the pieces should be placed as upright as possible, leaving open spaces for the quicker passing of the water, as well as for the entrance of fresh air to the roots. Some well-burnt charcoal might be safely used among the crocks, and

some pieces might be used in the peat and moss. The grower who had charge of the plants ought to crock, or superintend the crocking, so that he could be guided as to the amount of water plants required. The best time for potting the majority of epiphytal Orchids was doubtless early spring—February, March, and April; but many plants might be potted much later. A good guide in this respect was the condition of the plant; if the resting period were passed, and new roots were just beginning to push away, and it was necessary that a shift should be given, then was the time to do it. As many commenced growing early in the season, and others much later, it was wise to take each in turn according to the condition and state of the individual. For the greater number of the species good fibrous peat and clean sphagnum moss were the best ingredients to use; the *Cattleyas*, *Lælias*, &c., should be treated to a larger quantity of peat than some others; whilst the East India plants succeeded best when potted in sphagnum. For some of the strong-growing sorts—*Calanthe*, *Sorralia*, *Peristeria*, *Thunia*, and *Phaius*—good fibrous I am mixed in moss, sand, and charcoal formed a compost helpful in bringing about the most satisfactory results. This genera so treated should be placed just below the rim of the pot. Those potted in peat and moss should be fixed an inch or two above the rim, according to the dimension of the specimens; but the rhizome and base of the bulbs must always be above the potting material.

CATTELYAS, &c.

Perhaps the most showy group of Orchids and those that could be grown with success were the *Lælias* and *Cattleyas*. Each in their own department were rich in colour, and distinct in the form and marking of the flowers, presenting great distinctness in their appearance and growth. The course of treatment adopted with one would not command success with another. They would not err if they used pots for the tall growing kinds, and pans or baskets for the dwarfier varieties. The latter were best when hung near the glass. Stout bulbous species might be grown in baskets in perfect safety. *Dowiana*, *gigas*, &c., revelled in more heat than the majority of *Cattleyas*; they enjoyed a stronger sunlight with an atmosphere much drier than was experienced by those on the tables or stages. *Cattleya Mossie*, *Trianae*, *Warneri*, *Gaskelliana*, *Mendelii*, *Lælia purpurata*, *Elegans*, &c., should always have abundance of light. In winter they should have a night temperature of 55°, rising to 60° in the day, with a rise of 5° more by sun-heat; in the growing season, and throughout summer, 65° to 70° by night, with a rise by sun-heat to 85° or 90°, or even a higher reading. Plenty of air should be given, and every endeavour made in summer to induce a quick and sturdy growth, so that the bulbs might be thoroughly plump and matured ere winter sets in. Those that have not quite finished up their bulbs should be carefully tended as regards water. It was wise to hang newly imported pieces in a rather shady position, without any soil or material attached. They should be syringed frequently. By this treatment the plants plumped up their bulbs and gradually assumed a greener colour, roots pushed out along the rhizome and at the base of the previous season's bulb, and they might confidently expect new growths. When the breaks had appeared, and before the roots attained a length that endangered their safety in handling, the plants should be potted well up in the centre of the pot, and placed by themselves so as to be under the eye of the grower, that he may see every advance and stage of progress. It was preferable, for many reasons, to purchase large masses.

DENDROBIUMS.

Another section—*Dendrobium*s—differ from the foregoing because they mostly flower along the bulbs, and brought the blooms in clusters or pendulous racemes. Having noticed the extreme growths of these Mr. Swan said if colour and display were sought after this genus, which was easily managed, might be so grown that many species in one year would produce most brilliant effects. The colours and forms were as various as it was possible to conceive, with markings as clear and distinct as the most fastidious could desire. To secure success with this group a decided period of growth and of rest must be attended to, the former for the perfect development of growths and leaves, the latter for the maturing of the bulbs and the formation of the blossoms. In potting, let the pots be only just

sufficient to hold the plants, with no excess of material, for a continued damp soil had a tendency to cause the roots to decay, especially if the plants were over-watered during the rest season. When the plants commenced to grow in early spring the heat of an ordinary stove should be given—60° to 65° at night, rising to 75° and 80°, with a rise of 5° more by sun-heat. Such temperature might be given with safety during summer with a good share of water at the roots and a syringing overhead on bright days, morning and afternoon. When the growth was finished in the autumn lessen the quantity of water, cease the syringing, and by the lowering of temperature, encourage rest and the ripening of the bulbs.

During the resting period a night temperature of 45° to 50° was quite sufficient for the majority, rising to 55° in the daytime. Those forms having small bulbs and of a light substance should not be kept too dry, as many were liable to shrivel and die away before any apparent change had taken place in them. With regard to East Indian plants some of the smaller sorts should be grown in baskets and hung up near the glass. The *Phalænopsis* are best so grown. They should be all hung near together in a shadier part of the house. The taller kinds, *Vandas* and *Acridies*, were best when grown in perforated pots, for that being their most natural condition, the roots were not so liable to decay as when they were in ordinary pots. With the exception of a few species, the whole of the *Saccolabium*s, *Vandas*, *Acridies*, &c., required the temperature of the East India house—a night temperature in winter of 55° and 60° to 65° in the daytime, and in summer, 70° at night, rising to 85° and 90° in the day. Whilst the plants were growing, abundance of water must be used in the house, not so much to keep the contents of the pots saturated with moisture, as that the surroundings might be kept damp and the atmosphere charged with humidity.

ODONTOGLOSSUMS.

Perhaps the most popular Orchid of the day, and one that could be obtained at a cheap rate, was the chaste and lovely *Odontoglossum Alexandræ*. It required little heat in winter, and none whatever during summer and autumn, in a light house with cool dark surfaces for the plants to stand upon; a temperature of 40° to 45° at night, rising 5° during the day in December, January, and February, 50° to 55° at night with a corresponding rise in the daytime by sunheat in March and April, and in summer, when strong sunheat was certain to raise the temperature, every effort must be made to keep the house as cool and moist as possible. Very little rest was required for the *Odontoglossum*s. They needed more shade than any other class of Orchids, and plenty of air should always be admitted. In conclusion, Mr. Swan impressed upon all, that in plant growing they must bear in mind they were dealing with subjects possessing life in a high state of development; that the growth, the continual advance and progression, the display of gay and showy blossoms, and the perfection and beauty depended entirely upon the surroundings, the environment of the plants; and thus it became them to make themselves acquainted with the conditions most certain to ensure success, then by a judicious application of the best methods, willingly and patiently wait whilst they eagerly anticipate a joyful realisation of their most sanguine expectations.

RUBUS PHENICOLASIVS.

FOR the specimen whence our illustration (fig. 74) was taken we are indebted to the Rev. Canon Ellacombe. It is a strikingly handsome hardy or half-hardy bramble, with the lower surface of the leaves glaucous, as in a Raspberry, and the stems plentifully beset with long slender gland-tipped reddish-bristly hairs. To this latter characteristic it owes its name (phoinix, dark red; lasios, wool). The flowers are pink, and of little beauty, the petals being so much smaller than the sepals. These latter, as mentioned by Sir Joseph Hooker, *Botanical Magazine*, t. 6479, "close over the ripening fruit, but spread out again horizontally when the latter is ripe"—a peculiarity we noticed in a former number without then being aware that it had been placed on record. The fruits are reddish, slightly acid. The plant is a native of Japan, and was originally described by Dr. Maximowicz. Sir Joseph Hooker notes that it suffered severely in the winter at Kew, and was in consequence transferred to the temperate-house.

MARKET PLANTS.

BOUVARDIAS.—Among flowering plants that are grown for market purposes few are more valuable than the *Bouvardias*, especially for giving a supply of cut bloom throughout the autumn and winter months. As pot plants, too, some of the varieties are very useful; but for the latter purpose there is not a great demand, and it is only when the plants are grown to perfection that they realise anything like a fair price, or find a ready sale. Plants profusely flowered will sometimes realise 18s. per dozen, while plants that some people would consider fairly well grown would not be worth more than 4s. to 9s. per dozen, and at those prices it would be difficult to dispose of them. The price of cut bloom varies very much—from 6s. to 9s. per dozen bunches may be considered a fair average price, but sometimes it will fetch as much as 18s. per dozen during the winter months; on the other hand, it is often difficult to dispose of them at any price, and it is on this account that amateurs who send occasional consignments to Covent Garden Market experience some disappointment at the prices returned; for while the regular growers can always sell a certain quantity at a fair price, if the supply is plentiful, which (unfortunately for the growers) is too often the case, it is more than probable that any one who has no regular customers for his plants will be unable to sell out at any price. Although *Bouvardias* may be had in flower throughout the year, it is hardly worth while to flower them through the summer months when so many other good flowers, which do not flag so quickly as the *Bouvardia* does during the hot weather, may be had.

CULTURE.

To grow *Bouvardias* successfully it is essential to secure good stock plants, so that good strong cuttings may be obtained early in the year. The best plants to select the stock from will be those that have been flowering through the autumn; these can be ripened off early, and it should be remembered that to ripen the plants off properly they should not be crowded up together after they have done flowering, but stood out thinly in an exposed position, and gradually dried off. They should be ready for starting early in January; it is best to cut them back and allow them to remain in a cool house for a fortnight or so before starting them. When they are first placed in heat they may be lightly syringed frequently, but no water should be given at the root until they begin to start into growth, and then only very sparingly, as, if once allowed to get a little too wet at this stage, they get into a sickly condition, and never thrive or give good cuttings afterwards.

PROPAGATING.

The first batch of cuttings should be ready early in February. As soon as the young growths are about an inch long they may be taken off close to the old wood; if the plants are healthy, they will break out again freely, and soon give another batch. Cuttings strike freely in an ordinary stove propagating pit, but unless care is taken, the early batches are rather liable to damp off. To prevent this, fresh clean plunging material should be used, and no woody or other substance that is likely to contain fungus, should be used in the compost. Peat mould and sand in equal parts, is the best compost to use. A little air should be given to the pit every morning, but it must be closed again before the cuttings get withered; if allowed to get withered, they are not only much longer in striking root, but they never start away so freely afterwards. By the time the cuttings are well-rooted, they will require stopping; we like to stop them one before potting-off, and pot them as soon as they begin to make a fresh start. To grow good plants in one season they must not be allowed to receive a check at any time. It is important that they should be potted on as they require it, and have careful attention in watering; they should also be kept regularly stopped. If intended for pot plants, they must be stopped over evenly until they have formed sufficiently bushy plants to secure a good head of bloom, if for cut bloom it will depend more on the time the flower is required. Another matter of importance is to keep the plants free from insects. They are subject to a great variety of insect pests, Red-spider and Greenfly being their greatest enemies; there is also a small bluish aphid which is very troublesome during the summer; constant use of the syringe is the only remedy for the former, and fumigation on its first appearance for the latter.

The compost for potting should consist of light fibrous loam, with a liberal addition of well-rotted manure, and a good sprinkle of sharp sand, leaf-mould may also be used freely, or if the latter is not to be had and the loam is inclined to be heavy, a little peat may be used. The plants should not be potted too firmly. As soon as the plants begin to show flower, a little liquid, or artificial manure may be used frequently.

is also a very good variety, with bright coral-like flowers.

The following are the most useful single varieties:—*B. jasminiflora*, though one of the oldest, is still among the most popular. The flowers are pure white, sweet-scented, and above the average size. It is rather more delicate than most sorts, but under good treatment it is very prolific, and may be had in flower throughout the year. *B. longiflora* and *B.*

B. Veelandii is another good white variety, but when grown in an exposed position the flowers are slightly tinted with pink. *B. alba elegantissima*, *B. Davidsoni*, and *B. The Bride*, are all identical with it. *B. Reine des Roses*.—Flowers large, rosy pink; a good variety for pot-work.

B. rosea oculata.—A very pretty variety, of slender growth, with pale rose-coloured flowers.

B. Priory Beauty.—A good free-flowering variety, with flesh-pink flowers; a great improvement on the older variety, "Maiden's Blush"; one of the best for pots.

B. Bridal Wreath.—Somewhat after *Reine des Roses* in habit, flowers large, upper-side of petals white, under-side and tube shaded with pink. Makes a beautiful pot-plant.

B. flavescens.—Pale yellow; very pretty when the flowers first open, but it fades too quickly to be of much value for market work.

B. Hogarth.—Of the scarlet varieties this is the oldest, being one of the first garden varieties of Bouvardias raised, and it is still a favourite with many growers, though in some cases it has been superseded by *B. elegans*, which has larger flowers, and is perhaps a little brighter in colour, but not quite so free and compact in habit.

B. Dazzler.—A good scarlet, very free-flowering, and of good habit; very useful as a pot-plant, or for cutting from.

B. Vulcan.—A slender-growing variety, with small, deep vermilion-scarlet flowers, good for cutting from.

B. longiflora flammea.—A good variety for early spring flowering; the flowers are very bright scarlet when they first open, but they quickly fade, especially if the damp settles on them. *A. Hensley*.

FIG. 74.—RUBUS PHENICOLASIUS. (SER. P. 364.)

VARIETIES.

The varieties of Bouvardias are not so numerous as in most classes of florists' flowers, and no great advance has been made of late years, except in the double varieties, and these do not seem likely to become so popular as was anticipated when Alfred Neuner was first sent out. Several of the market growers went in for it largely, but they soon found that it would not become a favourite with the buyers of cut bloom, and it therefore had to be discarded; though it must be admitted to be very pretty, as are also some of the new scarlet doubles, the best of which is Sang Lorraine (deep vermilion scarlet). Victor Lemoine

jasminiflora longipetala are similar, if not identical with the above.

B. Humboldtii corymbiflora is one of the most useful for cutting purposes, the flowers being large, highly fragrant, and pure white, make it a general favourite. It is of vigorous habit, and flowers freely throughout the summer and autumn, but does not flower so freely through the winter months as many of the varieties.

B. candidissima.—As a pot plant this is one of the best. It is dwarf and compact in habit, very free, and the flowers are pure white, with a delicate perfume. It is a good variety for early spring work.

Notices of Books.

Mushrooms for the Million. By J. Wright. (171, Fleet Street).

EDITION after edition, or re-issue after re-issue attest the success of Mr. Wright's labours in making known the best methods of Mushroom culture, and now a fourth edition with a supplement has appeared in which the author has embodied his latest experience and that of his numerous correspondents. Mr. Wright is careful not to give exaggerated estimates of the profit to be derived from Mushroom culture, and does not advocate it as a panacea for agricultural distress, but that it may and does put money in the pockets of the grower and satisfies the taste of the consumer is obvious enough. Just as the ordinary gardener is in advance of the ordinary agriculturist, so the market growers who are of course specialists are in advance of the private gardeners, at least in their own speciality. It would hardly be requisite to call attention to this very patent fact, were it not for the circumstance that so few of our gardeners take the trouble to watch and see what their brethren of the market garden are about. For as many years as we can remember the market gardeners of Putney and Fulham, and probably elsewhere, have grown Mushrooms in the open air, but we do not remember to have seen the plan adopted in private gardens, though it is undoubtedly the best for producing the toothsome fungi in largest quantities. Mr. Dunn, of the Gardens, Farlington, near Leeds, gives some interesting figures, cited by Mr. Wright, as to the profits of this system of culture. By following Mr. Wright's directions 164 yards of beds were formed, of which 42 yards failed. The total cost was £52 17s. 7d., while the net profit is returned at £64 2s. 10s.

We believe that the outdoor system is the most certain method, though, as we have just seen, it is not absolutely safe, for your Mushroom is apt to be capricious; and though any or all of the twelve methods recommended by Mr. Wright are generally satisfactory, yet one and all are liable to occasional failure—at least, we know that some are so. The finest Mushrooms we ever saw on the whole were grown in an old Cucumber-frame on the plan indicated by Mr. Wright in his ninth method; but we remember being told by others who had practised it that the plan was not always successful. Mr. Wright attributes one cause of failure to commencing operations at the wrong time, and that this is so we can testify, as in one case after two years' waiting a fine crop was obtained where all hope had been abandoned. A very interesting feature in Mushroom culture is the well-established fact of the advantage of common salt

as a manure. This is a point that requires explanation. Does the salt directly benefit the Mushroom, or does it do so indirectly by slaying its enemies? The point is well worth investigating, for neither chlorine nor sodium (the two ingredients of which salt is made up) is considered of any special value in ordinary plants. Fungi, however, have ways of their own quite different from other plants, so that it need occasion no surprise to learn that what is suitable for them is not so for other plants. Sodium chloride has, amongst other properties, that of dissolving calcic phosphate.

A good suggestion is that of growing Mushrooms and Vines in the same house, when, under proper management, the Mushrooms grown on the beds in the house in winter will prove as profitable as the Grapes in summer. The beds are made immediately the Grapes are cut in November, and extended as manure is collected, so that a regular daily supply of Mushrooms is eventually secured.

Mr. Wright may be congratulated on his success, and deserves the gratitude of every one who in these times of depression is enabled, by following out his instructions, to secure a balance on the right side. The consumer also is under no slight obligation to Mr. Wright, who seems to befriend us all round, with the possible exception of the greengrocer; but we cannot say we have much more sympathy with that individual than has Mr. Wright.

THE LETTUCE.

At the New York Agricultural Experiment Station in 1885, eighty-three distinct varieties of Lettuce were grown under nearly 200 different names. These Lettuces present to the on-looker three distinct forms—*the lanceolate-leaved, the Cos, and the Cabbage*. It is a pertinent inquiry as to whether these form-species are of distinct origin, or have been produced by cultivation within recent times, and hence we offer a succinct account of our historical investigations.

The lanceolate-leaved form is represented with us by one variety only,—the Deer's-tongue, introduced as a seedsman's novelty in 1883. The type of this form is perhaps referred to by Piny, lib. xix., c. 38, "preterea longi, et angusti, intubi similis," as this plant of ours has a Chicory-like appearance in some stages of its growth.

It is certainly mentioned by Bauhin (*Pinax*, ed. of 1621) in 1621, and credited in his synonymy to Castor, 1585; and is figured by Bauhin (*Prodromus*, ed. of 1671) in 1671. Vilmonin (*Les Plantes Potagères*), 1883, refers to this type of Lettuce under the name *Romaine asperge*, *Lactuca angustana*, Hort., and a variety *L. cracoviensis*, Hort. *L. angustana* Allioni, 1785, seems to be of this form-species, and is recorded as found wild in Switzerland, and Maty's *Melles Dictionary* deems the *Chiciana Constanti-nopolitana* of Parkinson, 1649, to have some affinity to it.

The Cos Lettuces are distinguished by the upright growth of the root leaves, and the elongated and spatulate form of the leaf; they are also subject to a flattening of the stalk through fasciation. They were certainly known to the ancient Romans, as witness Piny's statement (*Nat. Hist.*, lib. xix., c. 38):—"Diligentiores plura genera faciunt: purpureas crispas, Cappadocicos, Græcos, longiores his foliis caulesque lati: preterea longi et angusti, intubi similis." Palladius's (*De Re Rustica*, lib. ii., c. 14) mention of the process of blanching can also be quoted:—"Candidæ fieri potantur, si fluminis arena vel litoris frequentur spargatur in medias, & collectis ipse foliis alligentur." The Cos Lettuce is the *Lactuca Romana dulcior, nigriore & Scariolæ hortensis folio, semine nigro* of Pena & Lobel (*Stirpium Alectoraria nova, Londini*, 1570, p. 90). Bauhin, in his *Pinax*, considers this form to be the *L. foliis obscuris virentibus, nigra Pini* of Dodonæus (*Emptulæ*, 1621, p. 644), the *L. nigra* of Cesalpino, 1583, and the *L. Romana* of Castor Durantes, 1585. In the sixteenth century the Cos form seems to have been less grown in northern Europe than in the south, for Pena & Lobel (*Emptulæ*, 1621, p. 644) say it is rarely cultivated in France and Germany,—more frequently in Italy, especially at Rome.

The class of Cabbage Lettuces are distinguished by the rounded and spatulate leaf which grows less upright than the Cos, although the commentators of the sixteenth and seventeenth centuries deem this class to

have been known to the ancient Greeks and Romans, and identical with the *Læconica* of Piny and the *Tartesian*, or *Bætica*, of Columella, yet I am unable to find any certain evidence. The only word I find in Piny which could suggest this class is "crispa," which may be translated "wrinkled," and as a class the Cabbage Lettuces are more wrinkled or blistered than are the Cos. Columella (*De Re Rustica*, x., l. 183; xi., c. 3; x., l. 185) was a native of Gales, but resided principally at Rome. He speaks of two kinds which may belong to this class,—one the Cappadocian "Tertia, quæ spisso, sed puro vertice pallet," and "quæ pallido & pexo densaque folio viret;" the other the Tartesian, or Bætica, which he says is from his country:—

"Et meta, quam generant Tartesi litore Gades
Candida vibrato discrimine, candida thyrsos est,"

and "quæ deinde candida est & crispissimi folii, ut in provincia Bætica & finibus Gaditani municipii." The words "vibrato discrimine" and "crispissimi folii" would imply a curled cutting Lettuce. The heading Lettuces of this class were, however, well known to the writers of the sixteenth and seventeenth centuries. In the *Hist. Plant.*, 1561, is figured one which closely resembles the Stone Tennis-ball variety of our gardens, and Bauhin in his synonymy identifies with varieties described by Tragus, 1533, *Tabernæmontanus*, 1578, *Matthioli*, 1586, *Gearde*, 1597, &c.

Whether the types of the Cos and the Cabbage form-species occur in nature I have not the material for study to determine. De Candolle (*Origin of Cultivated Plants*, 1855, p. 95) says "botanists are agreed in considering the cultivated Lettuce as a modification of the wild species called *Lactuca scariola*. The latter grows in temperate and southern Europe, in the Canary Isles, Madeira, Algeria, Abyssinia, and in the temperate regions of Eastern Asia. Boissier speaks of specimens from Arabia Petrea to Mesopotamia and the Caucasus. He mentions a variety with crinkled leaves, similar therefore to some of our garden Lettuces, which the traveller Hausknecht brought with him from the mountains of Kurdistan. I have a specimen from Siberia, found near the river Irtysh, and it is now known with certainty that the species grows in the north of India, in Kashmir, and in Nepal." From this reference we might infer that the Kurdistan form belongs to the Cabbage type, as possessing distinctly wrinkled or Savoy-like leaves, while the description of the ordinary *L. scariola* of Europe implies the Cos type.

I have not opportunity of access to herbariums whereby I can hope to satisfy myself of the conditions of the wild forms from various countries, but such evidence as I have here outlined strongly supports the hypothesis that our three form-species of Lettuce have originated from wild forms which have been brought into culture in different regions, and hence that our three form-species have different origin. The history of Lettuce, as published, affords no clue towards settling this point. Lettuces are supposed to have been grown by the Persians some 500 years before Christ, and to have been introduced into China between the years 600 and 900 of era; they were mentioned by Chaucer in England in the fourteenth century, and reached America with Columbus. *E. L. Startsevant*.

THE AMERICAN APPLE CROP.

SPRINGFIELD, MASS., August 18.—With the aid of some 1500 special correspondents, the *New England Homestead* will this week be enabled to present a very complete forecast as to the larger fruits whose harvest has now commenced. It is the "even" or bearing year for Apples in New England, but though there is a large yield of fall fruit, the reports indicate that the crop of winter Apples, will be about 70 per cent of the usual "even" year yield in the six States.

In the best Apple counties of Vermont, along Lake Champlain, not two-thirds a full even year crop will be secured, while Maine reports a decrease of 20 per cent., but both these States and New Hampshire will have a large surplus. Connecticut has but half a crop, and Massachusetts 80 per cent. But the falling off in New England will be partly made up by the great crop in the Apple sections of Nova Scotia, Annapolis and King counties. Nova Scotia last year exported

only 40,000 barrels, but this season will have a surplus of 100,000 barrels.

Perhaps the most significant fact revealed in this important report is, that the great Apple counties of Western New York promise "the lightest crop in twenty years, and the worse feature is that the quality promises to be comparatively poor. The great Apple counties of Orleans, Monroe, Niagara, Wayne, and Wyoming agree closely in reporting scarcely 50 per cent. of an average yield.

Many towns in that section which usually ship great quantities of Apples will have practically none for export this year, and farmers have very fine ideas as to prices. In Eastern New York there is a better prospect, but the average for the whole State (400 reports) is only 52 per cent.

Pennsylvania has 85 per cent. of a full Apple crop, and there is a good crop in Ohio. Oat farther west the reports are discouraging, and the North-west and South-west have such a small supply as to offer a remunerative market for the surplus of the Middle States, much of which was last year available for export.

Cable reports from various points in England and on the Continent confirm the earlier predictions of a rather short Apple crop there, especially of good fruit in England, but the Orange crop of southern Europe will be large, and will affect the English demand for American Apples somewhat. Consequently there will be a good demand in England for our fruit. We exported these nearly 900,000 barrels last year, the "odd" year, and the supply was so large that prices were barely remunerative.

The *Homestead* expresses the opinion that the exports will hardly be as large this year, and while prices may be a little better, the business of exporting Apples is now too closely managed to permit of any great advances over the profits to be had by selling in domestic markets. The wisdom of holding winter fruit for higher prices is therefore problematical, and must largely depend upon later developments. American Orange Pippins sold in Liverpool at 3.60 dols. per barrel on Monday, the first sale of the season, which is equivalent to about 2.25 dols. net on this side—a slight advance on current values.

Pears will be considerably below the usual yield; Peaches for the third time are practically a failure north of the forty-first parallel; Plums are a fair crop, and will be cheap; while Grapes in New Jersey are light, and the good crop in southern New England should bring fair prices. *Boston Leader*.

FORESTRY.

FORESTRY WORK.

WEEDING and cleaning will still occupy a good deal of the workman's time in this department. Rarely, indeed, has there been such a favourable season for the growth of weeds, the damp, warm weather furthering their increase in a very decided manner. Hand-weeding is preferable to hoeing during wet weather, but should the latter method be resorted to, it must be accompanied by immediate raking up of the weeds cut over. At any cost prevent the seeding of Groundsel, or such like troublesome weeds, by having them taken up, and placed in the depth for such previous to their season of flowering. Vacant borders may, as time permits, be dug deeply, or trenched over, and their wants supplied, whether by the addition of lime, nursery compost, leaf-mould from an adjoining woodland, or maiden loam from a neighbouring field.

Collect seeds of the Birch—the weeping form is best—care being taken to get the supply from such districts as are famous for producing the finest trees, notably the Braemar Highlands, and have them spread out in a dry airy loft so as to preserve unimpaired their germinative properties. This, the thorough drying and careful storing of forest tree seeds, is a matter of the greatest importance; indeed, I know of nothing that is more disheartening to the forester than when, after every care in preparing and sowing a seed-bed, he is rewarded with but an indifferent crop, or, maybe, no crop at all.

The storing of seeds in bags is to be condemned, unless under circumstances with which the ordinary nursery workman is unacquainted, the best method

* The word in the original French edition, p. 76, is "crispée," which should rather be translated "wrinkled" or "blistered."

being to spread these out evenly on shallow trays made of any light wood for a day or two after being gathered, and finally to store away such as are not required for immediate sowing in a loft or room that is free from damp, and through which a current of fresh air is daily passing. As the month wears on forest stuff intended for planting out this season may be lifted carefully and "laid in" thinly in some semishrub by corner of the nursery grounds until wanted for use.

Great care is necessary to avoid overcrowding in the trench, for this is accompanied with anything but good results, the plants becoming not only dusty dry at the roots, but frequently fermentation sets in, more particularly in the case of evergreens, where the branches are packed closely together. Tying newly lifted plants in bunils cannot be too strongly de-commended, unless in such cases where they are to be removed to a distance and planted soon after their arrival. Should some time elapse previous to planting, by all means untie the bundles and spread the plants thinly out in a trench prepared for the purpose.

PRUNING.

Pruning young nursery stock may still be engaged in—a work that is best performed before they leave the grounds. As soon as the crops are removed from the fields all pruning and thinning out of hedge-row trees should be set about. Overhanging branches frequently cause great loss to the farmers, and as they are of but little importance in hedge-rows and field trees they should, where practicable, be cut well back. Of course by saying this it must not be inferred that branches, under any circumstances, are to be removed from such trees, even although they may occasion very considerable damage to the farmer's crops, for beauty and symmetry of branch-spread should in all cases receive the first attention.

Dead branches on lawn and park trees must likewise receive attention, as well as withered and broken ones in the shrubberies; and encroaching shoots alongside woodland walks, drives, and roads generally. In removing dead and dying trees from conspicuous portions of the mansion grounds grubbing should always be resorted to, a much neater job being thus performed than by simply cutting over the stem at ground level.

First of all, remove the turf from around the tree to be taken out, roll it up and place aside for recovering the soil; then with a pick or grubbing axe loosen the earth in and amongst the roots, and with a rope, previously attached to the tree, pull it over in the most suitable position, and where least damage will be occasioned. After removing the trunk, limbs, and root, fill in the previously removed soil, level it over, and lay down the turf in a neat and workmanlike manner. For appearance sake, it may be well to daub over with paint, tar, or other prepared substances the wounds caused by amputating large limbs and branches that are within sight of the mansion buildings, or visible from drives, roads, and bye-paths. Previous to applying either of these substances, the wounds should be neatly dressed with a sharp pruning knife or adze, so that rain water may not lodge in the crevices and cause decay.

GENERAL WORK.

Other duties in connection with forest management that must receive attention are the cleaning and scouing of woodland ditches, renovating of culverts and gratings, clearing and repairing of roads and walks, making and storing of faggots for use during winter, preventing the depredations of insect life on young Pine trees, staking and tying of badly-rooted specimen trees, and erection and reparation of tree guards and rabbit proof nettings and fences. Hedge cutting should go on briskly and be got well in hand during the month; "rubbing in" and "cutting over" being deferred till time allows of its being done later on. Hand-weed or hoe and rake the ground along the line of fence, being careful at the same time to clear out all rubbish from the interior of the hedge, and to cut back all overhanging branches of neighbouring trees. Burn the rubbish so collected and spread the ashes over the adjoining ground. In all cases it is wise policy to burn the clippings of hedges, those from the Yew, Laurel, and Rhododendron being especially harmful to farm stock, their deleterious qualities being considerably enhanced when in a half-decayed state. Look well to fences alongside pasture grounds, and prevent cattle and sheep from entering

the woods. Fill up rabbit-burrows on woodland drives, which are dangerous to hunters. Cart stones for road repairing during the autumn and winter months.

Make alterations where necessary on the lawn and grounds, such as leveling, turf-laying, &c.; and substitute specimen trees for such as have died out or become unhealthy. Woodland vegetation, owing to the damp, dripping season, is unusually vigorous, and special care has had to be taken to prevent young trees and shrubs from being entirely lost sight of and damaged by the too dense shade afforded by such tall-growing weeds as the Nettles, Thistles, Barlocks, and Brambles. *A. D. Webster, Penrhyn Castle, North Wales.*

THE VINERY.

RENOVATING VINES.

If the Vines from which the crop has been taken have not yielded satisfactory results, the present is a good time to examine the roots, with a view to ascertaining and correcting the cause of their unsatisfactory condition; but before proceeding with this operation a sufficient quantity of suitable soil for carrying out the work should be got in readiness, so that the process of lifting and relaying the roots in congenial soil may be completed as quickly as possible. The compost should be in the proportion of five cartloads of clearness beam, one load of wood ashes, one load of lime rubble, one load of horse-droppings, 1 cwt. of Thompson's Vine and plant manure, and about 4 bushels of fresh dry root. This being ready, the lifting of the Vines should be carefully proceeded with by removing the soil with the assistance of four-pronged forks and shovels, taking care to injure the roots as little as possible in doing so. The roots, as much to facilitate the work of lifting and re-planting as to prevent them from being injured, should be tied separately together—that is, the roots of the individual Vines—in a damp mat, to keep them fresh while the exhausted and, perhaps sour, soil is being removed from the drainage. The latter, if found defective, should be re-arranged, and covered with a layer of turf, grassy side down.

The process of re-planting the Vines may then be proceeded with, and as the soil will subside some 6 or 7 inches within as many weeks from the time of planting, allowance to that extent should be made in forming the border. Then untie the roots, and spread them out regularly over the surface of the border, which should have a fall of a couple of inches from the bases of the Vines to the opposite side, at the same time cutting off any portion of the roots that may have been damaged in being lifted, and shorten back the points of all the roots more or less according to their length and strength. Incisions should also be made with a sharp knife about the base of the individual Vines, and longitudinally on the strongest and somewhat bare roots; to encourage the emission of young fibrous roots; these places should be covered with sand, then with 6 inches thick of the same soil as that forming the border. This done, give the whole sufficient tepid water to settle the soil about the roots, and then a surface-dressing of 3 inches thick of rotten dung, and over this, if the border be an outside one, 18 to 20 inches thick of Oak or Chestnut leaves as soon as they can be obtained. The leaves, in order to prevent them from being blown away, should be covered with long staple dung.

From the time the lifting of the roots is proceeded with until they have been re-planted and the roots have pushed well into the new soil the Vines should be shaded (heavily at first) from bright sunshine, with a view to retaining the leaves on the Vines until they have performed their ordinary functions, and in furtherance of this object the Vines should be syringed two or three times a day during the interval from lifting to the roots until the fall of the leaf. Vines thus treated should be allowed to come on in their own time next year, that is, to start into growth naturally about the end of March or early in April, and, if managed with ordinary skill during the various stages of their growth, from the disbudbing to the thinning of the bunches, &c., they will be capable of ripening a better crop of Grapes next autumn than they did this. But the Vines should be cropped lightly notwithstanding. *H. W. Ward, Longford Castle.*

The Flower Garden.

ROSE CUTTINGS.

CUTTINGS of hybrid perpetual Roses may now be put in; from now till the middle of October is the most suitable time for striking. Any good garden soil will suit them, and if a little sharp sand be added, it will hasten the rooting process. Secure the strongest shoots which spring from the bottom of the plants, twist them off with a heel in preference to cutting them off with a knife. Trim the heels with a sharp knife, but do not cut more than is necessary. Shorten the cuttings to the lengths of from 9 to 12 inches; cut off a notch with a spade as for the reception of Box edging; place the cuttings about 8 inches apart, replace the soil, and tread down firmly. Some slight protection should be given them during severe weather, and by the middle of summer they will be able to take care of themselves. Teas, Bourbons, and Chinas, may be similarly dealt with, only they must have the protection of glass, but no artificial heat is necessary, as it is rather injurious at this season of the year.

FLOWER BEDS.

Much attention will now be necessary to keep the flower beds clear of decaying flowers and leaves. Where such subjects as Pelargoniums are becoming crowded, the removal of a few leaves from the plants will admit light and air, and keep them from damping off.

LAWNS, &c.

Sweeping of lawns, to clear them of leaves and worm casts will now require constant attention. Brush and roll walks when rains occur to keep them firm and smooth. *Wm. M. Bailie, Luton Hoe Garden.*

PLANTS AND THEIR CULTURE.

GREENHOUSE PLANTS.

THE housing of these should now be completed as soon as possible, the unsettled state of the weather rendering it absolutely necessary; if delayed perhaps only for a few days choice hard-wooded plants may receive irreparable injury. Presuming the houses have had a thorough good cleaning, glass washed inside and out, and painting having been done where necessary, commence arranging by placing the choicest and best plants in a prominent position near the glass, avoiding overcrowding. It is better to stand specimens out first, and arrange a small or half specimen between them; this allows the light and air to pass about them more equally. It will be found that the plants will require more water at the roots after staging than when outside or standing on ashes under temporary shelter. A dry heat in the houses is to be guarded against; a few dampings down and the ventilators fully open will regulate this. For a few weeks keep a sharp look-out for mildew; if left for a few days it makes rapid headway. Azaleas will do very well in early Peach or Plum houses for a time, if a house is not devoted to them. Pay strict attention to watering; if neglected at this stage the lower foliage will soon show the effects, and become unsightly objects; on the other hand, if too much water is given, it is likely to excite them into growth, often sacrificing the blooming buds.

Tea Roses which have been stood out-of-doors, potted or top-dressed, as advised in former Calendars, will by this time have got nicely hold of the new soil, and be making a good break of free growth. If wanted for use at the end of October or early in November, the plants should be backed over now, and the best and freest plants selected for the first batch. The growths must be thinned out if at all crowded, or if any weak, exhausted shoots not capable of carrying blooms are to be seen they should be removed. Never cut back our Teas, but merely thin out, so as to let the foliage have room to fully develop itself. Any training which is required should be seen to now. We grow ours on ballnets and pyramids for convenience of shifting. Pick off all old foliage and surface, and clean the pots and tubs before taking them indoors. Generally half half the house at first; the other part suits the early varieties of Azaleas, Aucubas, Liliums, &c. If mildew shows itself, dust the plants affected at once with sulphur, with a little fine sifted lime mixed with it. *A. Evans, Lythe Hill, Haslemere.*

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY,	Sept. 27	Sale of Dutch Bulbs, in lots, at Stevens' Rooms Sale of Dutch Bulbs, at Frotheroe & Morris' Rooms Royal Horticultural Society's Meetings of the Fruit and Floral Committees, at 11 A.M.
TUESDAY,	Sept. 28	Sale of the Fernhill Collection of Orchids, at Frotheroe & Morris' Rooms (two days) Sale of Dutch Bulbs, also of Indian Azaleas, by, India, Gardians, &c., at Stevens' Rooms
WEDNESDAY,	Sept. 29	Sale of Dutch Bulbs, at Frotheroe & Morris' Rooms
THURSDAY,	Sept. 29	Sale of Imported Orchids, at Frotheroe & Morris' Rooms
FRIDAY,	Sept. 29	Sale of Dutch Bulbs at Stevens' Rooms Sale of Dutch Bulbs, at Frotheroe & Morris' Rooms
SATURDAY,	Sept. 28	Sale of Greenhouse Plants, at the Prestons Nursery, Wilkinstown

UNTIL recent years the PRICES which the various kinds of GARDEN PRODUCE realised were such as to leave little doubt that market gardening in this country was a fairly remunerative occupation, notwithstanding that the market growers, in common with all who are engaged in the cultivation of the soil, labour under uncertainties that do not exist in less variable climates. Moreover, the return in the case of most things with which the grower has to deal is necessarily slower than in the case of a good many of the commodities that go to supply the wants of the community. By far the greater number of crops represent the work of a year, or, at all events of the growing season, which amounts to much the same thing. But matters have changed, and for some years prices, as regards fruit, flowers, and most kinds of culinary vegetables, have fallen lower until they have now reached a figure that cannot be misunderstood. Vegetables, especially the commoner kinds, like all things that partake of the character of necessities generally sell better in proportion than other things, as the demand for them is steadier. It is hardly necessary to say that the prices which the consumer pays are not by any means to be always taken as a guide to those which the growers have to be content with. But when the retail price comes down to that which it has now reached for many things, it is evident that the growers' share cannot even have covered the cost of production, leaving anything in the shape of profit out of the question.

Take Grapes for instance; in some of the shops in the West End of London, good Muscats, quite ripe, and much better coloured than they are usually met with in August were selling lately for 3s. per pound, whilst Black Hamburgs, equal in quality were offered at from 2s. to 2s. 6d. Muscats ripe at the time named would have to be pushed on with continuous fireheat from the time the Vines were started, and the Hamburgs would also require assistance in this way for a considerable period. Bearing in mind the rents and rates that shopkeepers in London have to pay, and that they are dealing in a perishable article, and a luxury that people can dispense with, it is not difficult to guess how much of the above prices would represent the retailer's share, probably not less than one-half. To a certainty if he got the Grapes for nothing the whole amount would not be equal to the profits he would have been able to get out of similar productions a few years back. As a further evidence of the miserably low price that Grapes of the first quality are now sold for, it may be mentioned that the crop of Black Hamburgs grown this year by one of the most successful exhibitors, and one who has this season taken a number of 1st prizes with this variety, was disposed of for 2s. per pound for the crop.

Strawberries were not more than half a crop in the leading market districts where they are grown in quantity, consequently they sold better than last year, when scores of tons did not fetch the cost of picking and marketing; but still this season the prices realised were far from making up for the short supply.

Raspberries, which, taking one season with another, fluctuate less in value than other fruits, were this season such a drug that quantities were left ungathered.

Gooseberries and Currants were plentiful, and so cheap this year in most parts of the country as to be scarcely worth gathering. In London Gooseberries got down to a penny per pound, and Currants to three halfpence. In some of the large provincial towns Gooseberries were as low as 18 lb. for a shilling.

Plums this season present the unusual feature of yielding again an immense crop after bearing abundantly last year. All kinds, the shy fruiting Green Gages included, are heavily laden, the fruit in most cases being of finer quality than usual. As might be expected, the result of this is that Plums are a complete drug, so much so that some of the Kent growers have given up gathering, finding that the price they fetch will not pay the expenses of gathering.

Pears are this season more than usually uneven, some kinds bearing full crops, whilst others are all but fruitless.

Apples in most places are scarce; in a few localities they are fairly plentiful.

Verily growers of hardy fruit, as well as those who cultivate the tender kinds under glass, are having a bad time of it. Nor is the outlook in the future at all encouraging, for notwithstanding the statements that are so persistently given by some as to the advantages that may be realised by growing more fruit, it is evident that, as regards most of the hardy sorts in seasons when the crop is large, the supply is much greater than the demand; and with the kinds that are grown under glass, the prices now are continuously such as to leave the growers only an infinitesimal balance, or no balance at all, after the cost of production is covered.

The growers of vegetables find themselves similarly placed. The depression in agriculture has caused farmers, residing within a reasonable distance of the large towns, to turn their holdings into half market gardens, the outcome being, that through a good part of the season vegetables (excepting the various kinds of roots that will keep) make prices that leave little profit. Here again the home grower of Potatoes, Cabbage, Peas, Turnips, Carrots, French Beans, Lettuces, Radishes, and other things, finds that his earliest produce, which used to make up for the low prices he has to take in the middle of the season does not fetch more than half what it did in times past. Not the least disagreeable feature of all this is that, in common with everything the land produces, there are no prospects of garden produce making prices that will fairly remunerate the home growers. The cut flower trade is in no better case, as we shall show in a future article.

ANY one acquainted with DAHLIAS who made a critical examination of the flowers exhibited at the Crystal Palace on the 3d and 4th inst., must have been led to acknowledge there is urgent need for a new CLASSIFICATION; or else an entire reform in the making of a schedule of prizes. Who can venture to say what is, and what is not, a show or a fancy Dahlia? The one now touches the other so nearly, that those who know the flowers best hesitate to authoritatively state whether a certain variety is a show, or a fancy flower. But these are the two main heads under which exhibition Dahlias are divided, and they have existed for years past. That in the early days of the development of the fancy varieties they were of inferior merit, cannot be doubted, and that is probably the reason why they were grouped under a separate classification. But in these days of progress, the fancy Dahlia has quite overtaken the show Dahlia in point of size, symmetry, shape of petal, perfection of outline, height of centre, &c., and he would be a bold as-

serter who ventured to say that in these respects the fancy varieties are inferior to the others. Add to this the indisputable fact that it is difficult in the case of a few flowers to say with certainty whether they should be classed with the show variety types; and then the question arises, Is the old classification worth retaining any longer?

Under the present system two or more distinct colours (if the variegation is in the form of stripes or flakes) are essential to a fancy Dahlia; but the arrangement of the colours, whether the light or the dark preponderate, is sufficient to constitute the flower a show or a fancy variety. The fact is, the division is regulated by the relative position of the colours. Now, if any flower having a white, blush, pale sulphur, or yellow ground, be edged, tipped, or laced with a dark colour, it is classed with the show varieties; but when the disposition of the colours is reversed, when the ground-colour of the flower is dark, and it is edged or tipped with a lighter colour, then it is classed as a fancy Dahlia. Now, this is very arbitrary, and confusion is created by the appearance of flowers having their colours so disposed that it is difficult to assign their proper classification. A light flower, for instance, may have a distinct tip or edging of purple, and it is a show Dahlia; but let the purple be in the form of flakes or stripes, and then it would be included among the fancy varieties. A well-known show Dahlia, named Flag of Truce, is sometimes almost white, at other times delicately tipped with lilac.

At the recent Crystal Palace show a flower of this variety, in which the purple appeared longitudinally on the petals in the form of stripes or flakes, was shown in a stand of six fancy Dahlias, and awarded a prize. Fancy Dahlias will often sport to a self form, and the flowers are admissible for exhibition as show Dahlias; but should a show flower—say a crimson self—sport in the case of one or two petals only to an edged or tipped form, with the darker colour at the base, and its appearance in a stand of show flowers would lead to disqualification. On the other hand, a fancy variety that has sported to a self form, if it retains only two or three petals marked with the true fancy character, it is admissible on a stand of fancy Dahlias, though its presence would weaken it to some extent, but not disqualify it. So much confusion exists as to what constitutes a fancy Dahlia that in not a few provincial shows all tipped flowers are regarded as fancies, and the show flowers are the self-coloured or shaded varieties.

We venture to suggest, as a basis for a new classification of Dahlias, that the old divisions of show and fancy should be abandoned, and that both should be included under the head of exhibition Dahlias. Then four classes might be created as follows:—Self Dahlias, such as are of one colour and unshaded; as illustrations take Cardinal, Criterion, James Service, John Standish, Leah, Mrs. Henshaw, and Vice President. Shaded Dahlias, in which the self ground colour is shaded with something lighter or darker, but not distinctly tipped or edged, such as Burgundy, Herbert Turner, Imperial, Prince Bismarck, and Prince of Denmark; and tipped Dahlias, to include all tipped flowers; and striped Dahlias, all that are distinctly striped and flaked. There are some Dahlias among the fancies that are both tipped and striped, and these might be included among the tipped flowers, unless the tip is faint and uncertain.

Were this, or some such classification, attempted, schedules of prizes would have to be re-cast; but that is a matter that can soon be arranged. Prizes could be offered for collections of blooms comprehended under the foregoing headings, and the general public who

The Gardener's Chronicle.]

FIG. 75.—MESSRS. W. BARRON & SONS' GROUP OF CONIFERS AT THE LIVERPOOL EXHIBITION. (SEE P. 370.)

[September 15, 1884.]

attend Dahlia shows would be in a better position to make selections of favourite flowers, and have a clearer understanding of their characteristics and place in the several divisions. But what organisation or individual will inaugurate a new classification? That is the rub!

—ORNAMENTAL CONIFERS.—One of the most interesting and striking exhibits at the recent Floricultural Show at Liverpool, was constituted by the fine group of Conifers exhibited by Messrs. W. BARRON & SONS, of Elvaston Nurseries, Borrowash (fig. 75). The trees were placed against the tent, to the entry to which they formed a striking adjunct. Among the specimens were fine representatives of *Abies Douglasii*, var. *glauca*, which is said to be harder than the common form. *Retinospora tetragona aurea*, a handsome pyramidal or columnar variety, with golden foliage, and which is stated to do well, even in such unfavourable localities as are afforded by the colliery districts. *Tsuga Sieboldii* has the advantage of starting later in spring than others of its class. *Cupressus Lawsoniana glauca* is noteworthy for being a good grower and of good habit. *C. L. intertexta* is known as one of the most elegant of its class. BARRON'S Golden Yew was represented by specimens rich in foliage and of good pyramidal habit. The true *Abies* (or *Picea*) concolor was shown in good specimens, as also *A. brachyphylla*, which bids fair to be as hardy as *A. Nordmanniana* and even more handsome. These are only a few of the striking specimens of which this fine group was composed.

—“ILLUSTRATIONS OF BRITISH FUNGI.”—Dr. M. C. COOKE has lately issued the forty-third part of his useful *Illustrations of British Fungi*. The number of plates now amounts to 686, descriptions of the several species figured being given in the consecutive numbers of *Grevillea*.

—INSECTS INJURIOUS TO FRUIT CROPS.—Mr. CHARLES WHITEHEAD has published, for the Agricultural Department of the Privy Council, a report on the insects injurious to fruit crops, containing descriptions and figures of the commoner insects attacking fruit trees, such as it has been the practice of the *Gardeners' Chronicle* to give from its first foundation till now; JOHN CURTIS and J. O. WESTWOOD, indeed, have supplied most of the authentic information on this subject. It is an exceedingly useful thing to circulate this information in so convenient a form as the present—the more so, as much space is given to the important questions concerning prevention and remedies.

—BOTANICAL COLLECTORS.—Prof. MACOWAN, of Cape Town, recently addressed the South African Philosophical Society on the work done by collectors in South Africa, such as THUNBERG, DREGE, BURCHELL, ECKLON, ZEYHER, PAPPE, HARNBY, and others, whose work is probably better known and appreciated here than on the spot. Happily these men have left able successors.

—SILKWORM CULTURE.—Dr. RILEY has issued a sixth edition of his *Manual of Instructions* for those who desire to devote themselves to this branch of industry. The work is published at the Washington Government Printing Office, and is replete with information on silkworms, their habits, diseases, and management, as well as the preparation of the silk. It appears that in the United States the leaves of the Osage Orange (*Maclura aurantiaca*) may be used as food for the worms as advantageously as those of the white Mulberry.

—CACTUS DAHLIAS.—Those who object to the “lumpy, inelegant” Dahlia may now take their choice from the more refined single Dahlias, or the more pictorial “Cactus” varieties. One such is before us from Mr. CANNELL in the shape of a flower nearly 5 inches across, and with row after row of flat petals of the richest crimson-scarlet, not formally and severely packed, but lightly thrown together in careless order, allowing the light to pass through their brilliant surfaces as through a medieval stained glass window, and securing endless diversities of light and shade, multitudes of curves and adaptations which invite sympathy and confer interest, because they tell of the contest for light and air, of the struggle for supremacy, or of mutual accommodation and judicious compromise; in a word, they show that the flower is

a sentient being, with a history worth studying,—a great contrast to the florists' Dahlia, from which life and individuality seem stamped out to be replaced by a piece of artificial mechanism with a pretty complexion but no mind! At the same time came some splendid blooms from Cork of Mr. HARTLAND'S Old Dahlia with very richly coloured flowers and relaxed petals.

—*BEGONIA LUCIDA* VAR. *ROSEA*.—Lately we saw this plant with its bright red coloured flowers in what might almost be described as perfection, at M. SCHLUMBERGER'S establishment near Rouen. What a floriferous variety it is, too! M. SCHLUMBERGER assured us that since 1858 it had never been seen without a flower. That surely is enough to recommend it for general cultivation in the greenhouse where a continuation of bloom for effect is desired.

—*CYPRIPEDIUM SANDERIANUM*.—This extraordinary new *Cypridium* is now in bloom at Messrs. VEITCH'S Royal Exotic Nursery, Chelsea, and proves to be one of the most quaint and distinct of the genus. The shape of the pouch is much like that of *C. Stonei*, but is of a greenish bronze colour; the dorsal sepal is beautifully striped with chocolate-crimson on a yellowish green ground, and the petals, which form the most striking feature in the flower, are thrown back near the column, then extended spirally downwards, and ultimately elongated after the manner of *C. caudatum*, the tails extending from 1½ to 2 feet in length; in colour they resemble *Masdevalla chimera* (crimson and yellowish-white) at the broadest part, the narrow tails being brownish-crimson. The plant may be pronounced a decided and welcome acquisition. Messrs. VEITCH also have a very extraordinary and handsome nondescript in bloom, of which we shall have more to say later on.

—“WHY SHOULD LONDON WAIT?”—Abroad, in France, we see every little odd corner planted, no matter where it may be, and one is always tumbling on little plots of a very few yards square, having a brilliant display of plants and flowers; scarlet Pelargoniums, Ageratum, Coleus, Musas, &c., being the favourites for bedding purposes, and more often than not there is a background of evergreen shrubs. All this is displayed by a ground-work of grass, not gravel; and so many otherwise dingy corners are made into pleasing spots by a few plants. Surely something of this kind could be done in London. Are there not any odd street corners which could be so treated? The smoke is perhaps too powerful in some parts of London, but there are others where that objection hardly exists. 'Tis true that of late years something has been done, but is it enough? Are there not still some spaces railed in and covered with flag-stones instead of flowers?

—ROYAL AGRICULTURAL AND BOTANIC SOCIETY OF GHEENT.—We are informed that this Society will hold an exhibition of Chrysanthemums, to be opened on Monday, November 8. This exhibition is to be an international one, and it is to be hoped will be successful. It is requested that entries be sent in before November 1. There will be held in connection and on the same day as the show a meeting of the “Chambre Syndicale.”

—*ABROMA AUGUSTA*.—Amongst the many things that compete for a place in the stove this one seems to enjoy but a short-lived reputation, when it gets discarded probably to make room for some new comer. It was originally introduced as early as 1770, and was the *Theobroma augusta* of Linnaeus. Although so nearly allied to the Chocolate-tree, its fruit is quite useless for the same purpose, as implied in the more modern generic name now used, and which signifies that it is unfit for food, while *Theobroma* means food fit for the gods. In its native home in the East Indies it attains the size of a small tree, and is of some importance economically for cordage-making purposes. In Britain, however, it proves wonderfully accommodating in houses of prescribed area, and flowers more or less freely when only 2 or 3 feet high. A plant has been flowering for some time in the stove at Kew, although it does not exceed the latter height. The lower leaves are large and handsome, palmately five to seven lobed, with a cordate base and ovate, less divided towards the apex of the branches and amongst the flowers. The latter are nodding, notwithstanding the open and turned-up flower in the figure in the *Botanical Register*, vi,

518, which is drawn in that position to show the interior. The corolla is purple, and presents a peculiar appearance when its structure is examined, on account of the dilated and sacculate base of the petals.

—UNDERCLIFF HORTICULTURAL SOCIETY.—The second show of the season held in connection with this Society took place lately at Steephill Cattle, Ventnor, and proved a complete success. The exhibits were not so numerous; but they were of exceeding fine culture, especially the fruit and vegetables. Three large tents were utilised for the exhibits. The first thing which drew attention were the cut flowers, the artistic arrangements of three large baskets, exhibited by Miss D. A. HAMBOUGH, Mr. A. E. DAY, and D. NORFON, Esq., being wonderfully fine. Messrs. DROVER & SONS, florists, Ventnor, also showed some very choice Pelargoniums, Dahlias, Verbenas, bouquets, lady-sprays, &c. Mr. MILLS, gardener to Lady Hutton, of Appley Towers, Ryde, and Mr. FRAPP, NITON, gave every satisfaction in their decision as judges. Mr. T. H. CLOUGH, the popular secretary, helped materially to the success of the show.

—HYBRID ASHES.—In the *Deutsche Gartenzeitung*, for the current month, Dr. G. DIRCK describes and figures a couple of interesting hybrid Ashes. The seed-bearing parent was *Fraxinus parvifolia* and the other the simple-leaved form of the common Ash, *F. excelsior* var. *monophylla* (*F. heterophylla*, VAHL.) Of twenty-seven seedlings raised, no less than nine had simple or at the most trifoliate leaves which in texture, &c., approached closely to *F. parvifolia*.

—HARDY FLOWERS FROM READING.—At the annual exhibition of the Frimley, Yorktown, Cambridge, and Sandhurst Horticultural Society held in the grounds of the Government House at Sandhurst on the 8th inst., an extremely fine display of hardy flowers from the open ground was made by Messrs. SUTTON & SONS, of Reading. The value of this exhibit was in the instruction it afforded as to the fine and showy character of a large number of subjects obtained from seeds sown in the open ground—subjects not so often found in gardens as they deserve to be. They filled a large table, and they were tastefully set up in large bunches, so that the individuality of each could be seen to the best advantage. There were annual Chrysanthemums in great variety, the blue *Centaura cyanus minor*, *Coreopsis tinctoria*, *Cosmosium Burdigalense*, single Dahlias, splendid spikes of Delphinium, *Dianthus chinensis* in variety, *Gaillardias* of many types, including *Lorenziana*, *Helichrysum* in fine variety, *Illyhocks* in spikes cut from plants 8 to 10 feet in height, grown from seeds sown in the open ground this year; the pretty double crimson *Jacobaea*, *Rocket Larkspurs*, African and French *Marigolds* in great variety; *Sweet Peas*, also *Salpiglossis grandiflora* in such fine form as to set many of the visitors wondering what they were; double German *Scabiosa* of unwonted size and brilliancy of colour; *Scabiosa*, the yellow, purple, and white *sweet Sultans*, *Asters* in great variety, *Stocks* in the finest development, many varieties of *Phlox Drummondii grandiflora*, spikes of bold and showy *Gladioli*, and plants of the striped Japanese *Maize*. It was curious to notice that the visitors gathered themselves about the table containing these flowers as if they were looking for the first time upon many subjects hitherto strangers to them. The probability is they were. They were treated to a sight of many things that can be obtained at a comparatively small expense, and which can be employed to make their gardens look gay during the summer months, and at the same time avoiding the trouble of keeping bedding plants through the winter. This interesting and instructive exhibition received the highest commendation the judges could pass upon it.

—PUBLICATIONS RECEIVED.—*Tobacco: Growing, Curing, and Manufacturing; a Handbook for Planters*. Edited by C. G. WARFORD LOCK, F.L.S. (London: E. & F. N. SPON, 125, Strand).—*Physiology of Plants*. By S. H. VINES, F.R.S. (Cambridge: University Press).—*Life Histories of Plants*. By Professor McALPINE. (London: SWAN, SONNENSCHEIN & CO.—*Origine des Plantes Cultivées*. Par ALPH. DE CANDOLLE. (Paris: Félix Alcan, 103, Boulevard St. Germain).—*Subtropical Cultivation and Climates*. By R. C. HALDANE. (Edinburgh and London: W. BLACKWOOD & SONS).

—GARDENING APPOINTMENTS.—Mr. E. JONES, late Gardener to W. GILSTRAP, Esq., Farnham Park, Bury St. Edmunds, has been engaged as Gardener to H. COCK, Esq., Worcester Court, Worcester Park, Surrey.—Mr. JAMES WEBBER, for over three years Gardener at Hardwicke Court, Gloucester, has been appointed Gardener to G. F. LUTTRELL, Esq., Dunster Castle, Somersetshire.—Mr. F. CAMP, lately under Mr. KING, The Gardens, Oak Dale, Holmwood, Surrey, has been engaged as Head Gardener by A. SAUNDERS, Esq., Cliffs End Hill, Ramsgate, Kent.—Mr. W. T. WYTON, for the past six years Foreman to F. W. GRAFTON, Esq., Heysham Hall, Lancaster, has been appointed Head Gardener to Major BIRD, Crookhey Hall, Cockerham, Garstang, Lancashire.

HOME CORRESPONDENCE.

Horticultural Palace and Colonial Fruit Exhibition.—It may be of interest to your readers to know that when the present exhibition at South Kensington is closed, another will, by private enterprise, supersede it. A fresh site of 16 acres has been bought within 4 miles of Charing Cross, close to three railway stations in the west of London, with a permanently open space of several hundred acres adjacent. It is intended to establish a permanent horticultural and fruit exhibition with many of the attractions of the present exhibition, which will be supplemented by a large hotel and dining club. The plans we are preparing will absorb £200,000, and will be on view in a few days at the temporary offices, 4, Station Buildings, South Kensington. A large amount of the above sum has been already promised by gentlemen connected with the colonies. *The Architects to the "Horticultural Palace."*

Wasps.—Last spring I drew attention to the great abundance of wasps which then prevailed. From other sources came evidence of that abundance; indeed, the number of so called queen or breeder wasps was considered unusually large. It is true great numbers were destroyed, and thus checked the formation of nests; but even such destruction could hardly account for, in what seems to be a great fruit year, an extraordinary paucity of these destructive insects this autumn; at least such is my unusual experience here, for I have rarely seen fewer in the autumn months; indeed, where 50 have been killed sometimes previously, but one is found to destroy now. I shall be interested to learn whether this state of things is general [Certainly not in our experience. Ed.] and if it be so can any one give some tangible reason for it? Were it not for the remarkable prevalence of the wasps last spring it would naturally be assumed that the long and partly severe winter destroyed the breeders. Some more satisfactory reason than that must, however, be found. Having regard to the extent of the plum crop in Middlesex it might have been expected that the insects would have been exceedingly active here. If they are, then they leave me alone. Perhaps others have too many; perhaps not. What will she always prefer the room of the wasps to their company, yet they are such very familiar acquaintances that some interest must long attach to their proceedings. A. D.

The marked scarcity of wasps this season is being noticed on many hands, and it is all the more remarkable because queen wasps were numerous in early spring. It is supposed that the cold and inclement spring weather killed them off. Nests of wasps are certainly few and far between, but Mr. Bell of the Gardens, Strathfieldsaye, informed me a few days ago, that hornets were much more numerous than usual. An old gardener remarked a few days ago that when there was a good plum year, there was also plenty of wasps, but this does not appear to hold good for this season. Is there as great a scarcity of wasps in the north as well as in the south? R. D.

Epipactis latifolia.—It is difficult to see the force of the argument at p. 305 concerning this Orchid, although it is quite possible to have found it under the conditions mentioned. The same remark applies in a more or less modified degree to several other species of Orchid as well as other plants which have come under my observation. That there should be an entire absence of leaves on the Epipactis this summer after having flowered so strongly last year is singular, and ought to be accounted for in some other way than that the bud is recruiting itself underground before flowering again. If the hard and fleshy fibrous roots have become so much exhausted in the process of producing flowers that they are unable to produce leaves the following year, it would be a physical im-

possibility for them to recruit their vigour without the aid of foliage, unless it can be proved that the plant is either a parasite on the roots of something else, or a saprophyte (feeder on decaying animal or vegetable matter). Without leaves or other exposed and green parts there can be no assimilation, and a parasitic habit does not yet in this instance seem to have been demonstrated. I have detected the plant in a flowerless condition in cresses in the Isle of Wight, and also on the Surrey Downs in similar situations—conditions which I attributed to the light denseness of the copsewood and insufficiency of light. Other species of Orchid seem to dwindle away in the same manner until they stop producing leaves, and become, for all practical purposes, dormant; but when the copsewood is again cleared away, they spring into life and activity so suddenly as to preclude the idea that they have originated from seeds in that time. J. F.

Peas, Telephone and Others.—One of your correspondents on this subject says it must be owing to cultivation that this Pea has mellowed and otherwise been benefited this season. I cannot agree in that. We cultivate deeply; the kitchen garden is 400 feet above sea level, 3 acres in extent, and without a bush or a tree in it. We sow some 30 quarts and grow all the leading kinds, and usually have Peas on the table five months in succession, finishing with the last week in October, and have gathered the first week in November; so that when I said that this variety had failed with us I did so conscientiously, and it will take some time to persuade me to grow it again, and also its twin brother, Telegraph, which I consider second-rate in flavour. There is hardly a Pea in cultivation in this country which we have not grown here, and many of them before they were even named or had been sent out, so that we know something of the subject. Stratagem for exposed gardens or places where space is a consideration, is simply a magnificent kind to grow—a giant cropper with fine flavour. Worsley Wonder is a kind but it is known—a second early and a good desirable kind, and many others which your correspondent's name are A. I, but we must not discard that old Pea, Champion of England, although (as I have heard it was sold by the racer one Sunday morning for a quart of beer), it has stood the test of fifty years and very likely will do so for the same time to come. Our *Ne Plus Ultra* are just beginning, five grand rows without spot or blemish, and for late work they have no equal. *J. Root, Eridge Castle, Sussex.*

Turnips.—I have had this season admirable evidence of the value of new seed of turnip in producing quick growth as compared with old seed. Last year I sowed old seed I think of two years' saving, and the growth was so slow as to lose the season for the production of bulbs. Some seed saved from the same stocks this summer (and rather small seed, too, for I had to pull it early to save it from bird-), and sown about the middle of August, in spite of the heat and drought, gave a capital plant, and the growth, although the ground is poor, has been remarkable. I could not wish for better, having in view nice medium-sized bulbs for winter use. The sort is that excellent but still despised kind, Yellow Dutch, or otherwise known as Orange Jelly, the best-flavoured Turnip we have, and quite as handsome as any. However, its flesh is yellow rather than white, and that is a sin not to be combated. The very earliest maturing Turnip we have now seems to be the Strap-leaved Milan, an improved Early Manich, keeping better and quite mild. For early use comes the Early Six Weeks, and for winter work the same kind in mild situations. Will any experienced seed-man, who has no speciality in Turnips, kindly say how far the Six Weeks, Missetal, Snowball, Jersey Lily, diller or agree, and if so, which of these is the true original appellation. The purple and green-top Turnips are rather too large and coarse for garden work, with the exception of those which are exceptionally early. I would ask further is there a better winter garden Turnip than Six Weeks? A. D.

The Origin of *Helianthus multiflorus*.—In Asa Gray's *North American Flora*, vol. i., part 2, p. 280, we are told that *H. multiflorus* "must have been derived from *H. decapetalus*," but why is it not a hybrid between *H. decapetalus* and *H. annuus*, the latter being probably the seed parent? The genus *Helianthus* readily produces hybrids, and some annual kinds, fertilised with the pollen of some perennial kinds, produce perennial hybrids. *H. cucumerifolius* in my garden produced several forms of hybrid with *H. drummondii*, which were perennial. I recorded the fact at the time, but the hybrids were not worth preserving. 2. In its habit and general appearance and its lateness of flowering *H. multiflorus* resembles *H. annuus* more than *H. decapetalus*. A fine specimen of *H. multiflorus*, grown from a spring bulb to a single stalk, and carrying all its flowers horizontally, many of them 6 inches across,

may easily be mistaken at first sight for *H. annuus*. 3. The leaf character, which is so important in *Helianthus*, come in *H. multiflorus* much nearer to *H. annuus* than to *H. decapetalus*. In the latter the leaves are nearly rhomboidal, with a short winged petiole, and sparsely and irregularly serrate. In the other two they are cordate-ovate, with a long free petiole, and more densely serrate. Nearly all the *Sunflowers*, except *annuus*, which flowers too late, ripen seed here; but I have never been able to find a seed on *H. multiflorus* or on the other hybrids mentioned. If *H. multiflorus* is a development of *H. decapetalus*, where are the intermediate forms to fill up the wide gap? The so-called "major," "maximum," and "flora-pleno," are merely different forms of the same development, and present precisely the same leaf and flower characters, size and doubling being mere accidents of cultivation. *C. Wolley Dod, Edge Hall, Malpas.* [The leaves sent bear out our correspondent's statements. As to *H. decapetalus*, in addition to the characters mentioned, the venation is also different, the secondary veins come off from the midrib at a more acute angle, and run nearly up to the margin of the leaf before they curve and break up into a network. The venation of *H. multiflorus* and *H. annuus* seems to be identical. Ed.]

"*Agaricus personatus* dangerous."—A note under the above heading, from the pen of Mr. W. G. Smith, occurs at p. 307 of the *Gardeners' Chronicle* for September 4 last, respecting which I have a few words to say. Mr. Smith calls attention to a previous article of his, in which it is pointed out that the name *Agaricus* is occasionally of a dangerous character. The fact subsequently confirmed by the Rev. J. M. Berkeley. He then says:—"In the *Daily News* for August 25 last a report is given of a case of a man and his daughter who were both killed by eating fungi locally known as "Blue Buttons," and no doubt *Agaricus personatus*. I have other records of the same nature." In this case, however, I believe the *Agaricus* is placed on the wrong horse, and that *Agaricus phalloides* is the real culprit. I have not the issue of the *Daily News* in question, but have no doubt it refers to the case of the man William Whitworth and his daughter, who died at Nottingham. The facts are these:—Dr. H. Hinford, of Nottingham, wrote me on August 23 last as follows:—"I am sending you by this post some specimens of fungi which have caused fatal poisoning in the case of a child, and his father is now in a very critical state under medical care in the general hospital at Nottingham. These specimens were handed to my colleague, Dr. M. C. Cooke, who determined them to be *Agaricus* (*Amanita*) *phalloides*, Fries (a species which poisoned some people at King's Lynn two or three years ago). There is no doubt of the specimens sent being the plant which did the mischief, for Dr. Hinford remarked that they were "all that remained of those that were gathered." He described them thus:—"The epithelium in the smaller ones, when fresh, was of a light yellowish-olive-green. In the older ones the green was much darker. The gills were quite white." I at once replied to Dr. Hinford, who, writing on August 26, supplied the following additional particulars (I give the substance of them):—"My patient died six or seven hours after eating the fungus. He mistook it what they call here a 'blue button' or 'blue bottom,' *Agaricus* (*Tricholoma*) *personatus*, which is sold in very large quantities in the market here. A *phalloides* must be a very poisonous variety, as the child only ate part of one." Such are the facts—as I know them—and in this case *Agaricus personatus* may be acquitted, as "Not guilty." Of the other cases mentioned I can say nothing, except to suggest the possibility of a specimen of a poisonous kind being sometimes gathered by mistake amongst a number of eatable ones. One cannot help wishing that the conditions under which an edible species may become dangerous could be definitely ascertained. *R. A. Rolfe.*

Lilium auratum.—Perhaps it may interest your correspondent "A. D. Webster," and also other readers, to hear that this handsome and attractive Lily succeeds remarkably well here planted in the open, amongst and between the *Rhododendrons*, the soil being a mixture of peat and loam, and well drained. Single bulbs that were planted in March, 1884, are this year producing from two to four spikes, which are, on an average, from 6 to 8 feet in height. None have less than twelve flowers on a spike, and on one plant with four spikes there are sixty-six blossoms, thirty-three on each spike. These have a very striking and noble effect, standing, as they do, above the level of the green foliage of the *Rhododendrons*. *John Austen, Witley Court.*

German Moss Litter for Orchids.—I shall be glad to know if any of your readers can give information as to the use of the above. The great difficulty and expense in getting good peat for Orchids makes one desirous to obtain a substitute, provided it is equally good. But it will not do with such chic

white, the interest of Grape growers was mainly centred. The 1st prize was closely contested. It was secured by Mr. McKelvie, Broxmouth Park, with grand samples of Muscat of Alexandria, Muscat Hamburg, Barbarossa, Kempsey, and Black Alicante, in splendid form. Mr. J. Boyd, Callander Park, took 2d prize in this class, and Mr. J. Hunter 3d, each staging Grapes of a quality calculated to sustain their names as noted Grape growers.

In the class for eight bunches, Mr. Boyd came to the front with magnificent bunches of Madresfield Court, Muscat Hamburg, Alnwick Seedling, and Black Hamburg; Mr. McKelvie was a close 2d, with perhaps the best samples of Muscat of Alexandria, Gros Maroc, and Madresfield Court in the show included in his collection.

The class providing for four bunches of Grapes, distinct, brought out a large number of competitors. Mr. Boyd stood 1st with well-finished bunches of Alnwick Seedling, Black Alicante, Muscat Hamburg, and Black Hamburg; Mr. J. McHattie, New Battle, was 2d with splendid samples of Lady Downes, Duchess of Buccleuch, Black Hamburg, and Muscat of Alexandria, the last named barely finished; Mr. Hammond, Brayton Hall, came in 3d, with four bunches, which struck us as being deserving of a higher place.

First honours in class 8, viz., two bunches Muscat of Alexandria, were easily carried by Mr. McKelvie,

lence. The best Queen came from Mr. G. Ramsay, Fordell, Mr. McIndoe, Hutton Hall, making a good 2d.

Mr. McIntyre, The Glen, Inverleithen, was the only exhibitor in the class of smooth Cayennes, but staged a very good fruit, securing the 1st prize.

The last-named exhibitor also secured the 1st prize in the class for two Pines, and was closely followed by Mr. Ramsay, the only other competitor.

MELONS were a sparse feature, but were of excellent quality. In the green-fleshed class Messrs. L. Dow and John Hammond were respectively 1st and 2d; and in the scarlet-fleshed class Messrs. McIndoe and C. Comfort, Broomfield, were the prize-takers in the order set down.

FIGS formed a poor show as regards numbers, but the 1st and 2d prize lots were both of superior merit, the twelve from Mr. McIntyre, The Glen, taking 1st prize; those from Mr. D. Melville being placed 2d.

PEACHES were well represented, but the 1st prize lot, from Mr. McLeod, Stirling, consisting of twelve enormous and perfect Lord Palmerstons, excited general attention. Mr. John Hammond's twelve were little behind in point of size, and being described as a seedling from Late Admirable, but bearing some resemblance to Stirling Castle, created considerable interest apart from the evident excellence of the variety as a late Peach.

as we have seen them at an autumn show here, but we have rarely seen better specimens of cultivation than appeared in some of the classes. The tables of plants, 20 feet by 5 feet, arranged for effect, in the gardeners' class, was keenly contested by Mr. Grossart, Oswald Road, and by Mr. C. Smith, Restalrig. Both tables were good, but Mr. Grossart carried the 1st prize with a table in which choice foliage and flowering plants—among the latter a good sprinkling of Orchids were blended with admirable taste.

In Cape Heaths and stove and greenhouse plants Mr. John Paterson, Millbank, distanced all competitors with his first-rate specimens in these classes.

In Ferns a Silver Challenge Cup, given for six exotic species, exclusive of Adiantum and Gleichenia was won Mr. McKinnon, Melville Castle, who staged a very fine lot indeed. The 1st prize for twelve dwarf British Ferns was easily secured by Mr. A. Anderson, of Kilrig, an enthusiastic amateur. His collection was a very select one, containing well cultivated specimens of Asplenium germanicum, A. septentrionale, Blechnum spicatum Maundersii, Woodsia hyperborea, and other choice sorts.

Orchids were not numerous but good, the principal exhibitors being Mr. Grossart, who carried off the highest honours; Mr. McLeod, Stirling; Mr. Findlay, Osborne Terrace, Edinburgh; and Mr. John Paterson. Tuberos Begonias were well represented by the 1st prize lot, belonging to Mr. A. Kerr, Sunlaws. Table plants also were a plentiful and well contested class amongst gardeners, Mr. McIntyre, Barlingtots, taking the 1st position in the foliage kinds, and Mr. Grossart beating all in the flowering kinds.

NURSEYMEN'S TABLES ARRANGED FOR EFFECT.

Of these there were only two in competition for the Society's prize. The competing tables were 40 feet by 10 feet, and the contest lay between Messrs. Laird & Sons and Messrs. Ireland & Thomson. The first-named firm obtained the 1st prize, with a table of plants which for clearness, health, and the richness of colouring which characterised the Crotons, Dracenas, and all other foliage plants, has never been surpassed at these competitions. There were also some remarkably well done plants of the newer Alocasias and Anthuriums, abundance of lighter and more graceful materials, such as Cocos, Phoenix, Asparagus in several forms, and a light sprinkling of floral colouring. The whole was grouped with good taste.

Messrs. Ireland & Thomson, though beaten, were not disgraced; their table was rich in very desirable stock, and formed a charming picture, in which graceful and highly coloured foliage blended pleasingly.

NURSEYMEN'S TABLE PLANTS.

The collections of table plants put up by nurserymen were excellent, especially those of Messrs. Laird & Sons, which took 1st prize in the foliage class, and also in the flowering class; Messrs. Ireland & Thomson being placed 2d in both cases.

Messrs. Methven & Sons had a very handsome table of Liliums, Palms, and miscellaneous stove and greenhouse plants in flowering and leafy sorts, very tastefully put together. They exhibited also on the same table specimens of the choice wreaths and crosses which are a speciality of theirs. In another part of the hall they displayed an extensive collection of ornamental Ivies in pots, which were greatly admired.

Messrs. Dicksons & Co. had a large table, on which they displayed a good collection of greenhouse, stove, and hardy plants along its centre. On one side the whole length of the table was laid out a collection of about 130 varieties of Apples, the production of their own trees at Liberton Nursery. The collection was interesting and instructive to those on the outlook for selections. On the other side of the table an assortment of cut flowers including hardy border perennials, Dahlias, Carnations, Gladioli, &c., was displayed.

Near by the last-named firm, Messrs. Lamont & Son, had a large table occupied chiefly with blooms of their splendid strain of Single Dahlias, already commented on in recent issues.

The Lawson Nursery Company made up an attractive group of well-grown Conifers, Ivies, and other hardy stock in pots at one end of the hall. Some large naturally grown plants of Clematis viticella rubra and several varieties of greenhouse Rhododendrons in flower, added colour and interest to the group. A very distinct Golden Yew named Taxus horizontalis aurea—a form we have not met with before—attracted general attention.

Mr. Robertson Munro, Jocks Lodge, had a pleasing table of hardy perennial and alpine plants, summer-flowering Chrysanthemums, and Dahlias.

The New Bull Company, Colchester, were represented by a very attractive exhibit of Lilium blooms, especially forms of L. auratum, and L. speciosum, Nerines, Gladioli, and a few Orchids.

Mr. Thos. S. Ware, Tottenham, put up an excellent assortment of single and double and pompon Dahlia blooms.

FIG. 76.—PROLIFEROUS NARCISSEUS BULBS. (SEE P. 372.)

whose bunches were excellent; Mr. Day took 2d position with large bunches and enormous berries which however fell somewhat short of perfect finish.

The two finest Black Hamburgs were put up by Mr. Boyd, and the next best by Mr. Murray, Culzean, both lots being excellent in colour and finish.

Mr. Potter, Whitehall, Carlisle, carried off the 1st prize for one bunch Muscat of Alexandria, a not fully finished sample, which however foretold perfection by-and-by; and Mr. Murray, Parkhall, took the 2d prize.

The best single bunch Black Hamburg came from Mr. Collins, Walkerburn; the best single Alicante from Mr. Wilson, King's Knowes; the best Alnwick Seedling from Mr. D. Murray; and the best Gros Colmar from Mr. J. Jeffrey, Craigeleuch, Langholm; the best Lady Downes from Mr. W. Murray, Parkhall.

The best black Grape, not named in the schedule, came from Mr. McKelvie, being a fine bunch of Gros Maroc.

The best white Grape, not named in the schedule, was put up by Mr. Ramsay, Fordell, a remarkable bunch of Chasselas Napoleon.

The best flavoured black Grape proved to be a small but highly finished sample of Muscat Hamburg, from Mr. McIndoe; while the best flavoured white was Duchess of Buccleuch, grown by Mr. McHattie.

The best bloomed black Grape was staged by Mr. Boyd.

PINES were not numerous nor remarkable for excel-

NECTARINES were few but good, the Pitmaston Orange, from Mr. Harkness, Broadmeadows, which took 1st prize, being of superior quality.

APRICOTS were rather scarce, but well represented by those from Mr. Galloway, Minto House, twelve fine Moorpark, which took 1st prize.

PLUMS were pretty numerous, the best coming from Mr. McIntyre, Darlington, Mr. Richard Parker, Impney, Droitwich, and Mr. Gideon Potter, North Berwick.

PEARS were only moderately numerous, but some very good samples were put up, the best in the class of six varieties fit for table being from Mr. McLean, Maidstone.

APPLES constituted a numerous display, but with a few exceptions were not up to average quality at this season of the year. The best collection of twelve varieties was exhibited by Mr. Galloway. The best six dessert varieties fit for table were put up by Mr. D. Murray. The best six Blenheim Oranges from Mr. Richard Parker. The best six Cox's Oranges also came from the last-named grower. The best six each of Ecklinville seedling, Keswick Codlin, Warner's King, and the six bravest Apples were put up by Mr. Brotherton, Tynningham. The finest Golden Nobles, Lord Suffield, and Ribston Pippin were the growth of Mr. McLean.

PLANTS.

As has already been said these were not so numerous

The table of plants exhibited by Mr. Lindsay, Curator of the Edinburgh Botanic Gardens was in so far as plants were concerned, perhaps the most interesting of any in the hall to both the gardening and the general public. It was furnished with beautifully-grown plants of various Sarracenas, Darling-tonias, Nepenthes, Droseras, Rhipidopteris, and many other things interestingly attractive even to the uninitiated in plant lore.

CUT FLOWERS.

In the classes set apart for gardeners and amateurs there was some very close competition, and there was a pretty full representation of the various classes of autumn flowers. The spikes of Hollyhocks tabled by Mr. Kerr, Sunlows, led nothing to be desired, the same may be said of his single blooms, which were good in their form and cleanness of petal. The six blooms shown by Mr. Tweedie, teacher, Swinton, afforded gratifying evidence also of the fact, that a way has been found in several parts of the country simultaneously, by which the hitherto fatal fungus that has so long rendered the successful culture of this favourite autumn flower impossible may be overcome.

In the nurserymen's classes of cut flowers there were some capital Hollyhocks exhibited by Mr. Campbell, florist, High Blantyre, who took first prize for both spikes and single blooms. Messrs. Stewart & Mein, Kelso, were 2d. Gladioli were shown in perfection by the last-named firm, their thirty spikes gaining 1st prize, and the admiration of everybody.

Single Dahlias were competed for by Messrs. Laird & Sons, Messrs. Laird & Sons, the former taking an easy 1st prize.

There was a limited show of double Dahlias. Messrs Laird & Sons were placed 1st for twenty-four show sorts, and Mr. Hugh Dickson, Belmont, 2d—a position which, in the opinion of many, it was considered should have been reversed.

Roses were well exhibited by Messrs. Cocker & Sons, Aberdeen; Mr. Dickson, Belmont; Mr. T. Smith, Stranraer; and Messrs. Coll, Dundee. The contest for honours by between the two first-named growers in the larger class of twenty-four blooms, and we understand it was somewhat of a surprise to Messrs. Cocker and many besides that they were awarded the 1st prize.

In the class of eighteen blooms, Mr. Dickson was placed 1st, and Mr. T. Smith 2d.

VEGETABLES.

There was a grand number of vegetables, one of the finest that has been seen in recent years at this show. Great excellence characterised many of the exhibits, the grand Crotons set up by Mr. G. Murray, Culzean, the enormous Leeks of Mr. Cairns, The Hirsch, Coldstream, and the collection of seventy-five distinct perfect samples of Potatoes by Mr. Bogie, Dundonald, were specially notable.

ROYAL NORTHERN HORTICULTURAL OF ABERDEEN: AUTUMN SHOW.

On Friday and Saturday, the 10th and 11th inst., the annual autumn show of this Society was held in the Music Hall Buildings, Aberdeen. The exhibition was generally regarded as one of the best the Society has had.

In the section for pot plants there were some good specimens of Fuchsias. As a rule the plants were in excellent bloom, but the foliage was in bad condition. For Fuchsias, which were best in the amateur section, Mr. William Shureff, Aberdeen, took 1st, 2d, and 3d prizes.
